Abstract
Chronic oral ingestion of L-Carnitine can increase muscle carnitine and alter muscle metabolism during exercise. Yet, few similar results are published regarding acute oral ingestion and performance improvement. Our hypothesis is that non-mitochondrial ATP resynthesize is increased along with Carnitine acetylation, influencing lactate metabolism, and individual performance over single oral ingestion. Therefore, our propose will be to test the current hypothesis by monitoring performance indicators, during 30 seconds Squad Jump Test, after 4.5 g of L-Carnitine oral ingestion. Fourteen football players (n = 14) with a median age of 19 years old (18 – 22), 71 kg (65 – 74.5) median body weight of and 170.9 cm (168 – 176.5) height were recruited in the study. Study protocol consisted of two 30 seconds Squad Jump Tests (SJT). The test were conducted before (Test 1) and after one single oral supplementation dose (4.5 g) with L-Carnitine (T2). Of the fourteen subjects (n = 14) all of them were allocated to L-Carnitine ingestion after T1 test. The ingestion consisted of 4.5 g/day. After 5 days the athletes re performed in T2 30 seconds SJT. To avoid circadian rhythm influence, similar conditions were respected. The statistical analysis were conducted by using SPSS 20. software. The level of significance was set at α=0.05. Comparative changes were measured between T1 and T2. During T1, 1th rep, Tf was not significant different (p=1.00) from Tf, T2, 1th repetition, as seen through 0.43 (0.38–0.48) vs. 0.43 s (0.38–0.48) and 0.46 s (0.42–0.50) values. Similar data was observed during 1th repetition between Ct: 0.66 (0.58 – 0.92) vs. 0.66 s (0.58 – 0.92) (p=0.826). An improved performance can be unlikely due to L-Carnitine, as seen through Lactate accumulation. Further on, we must take into account a possible effect over Lactate tolerance which might favoured improved performance over T2 unlike T1.
Keywords: Carnitine, Power, Lactate, Athlete.

1. Introduction

Carnitine is found in the heart and skeletal muscles, whereas 3/4 of its content comes from food intake. (1) Acetyl L-Carnitine is one of the most frequently used ergogenic aid in both recreational and performance athletes. (2) Ingestion is proposed due to its role in recovery and endurance capacity. (3) Therefore, based on its mechanism, L-Carnitine can be used as a positive factor in muscle mass improvement.

Less research is focused on L-Carnitine use during low volume high intensity effort. (4) L-Carnitine use in training or competition periods varies with individual effort capacity, intensity and effort volume. (5) It is well known that during low intensity effort L-Carnitine can improve fat oxidation and limit muscle glycogen use by activating fatty acyl molecules through mitochondria inner membrane. (6) However less specific data is available regarding short high intensity effort, with energy metabolism differences over athlete age. (7)

The use of large amounts of L-Carnitine is dependent on plasma and muscle glycogen gradient concentration. Yet, plasma concentration is lower in comparison to muscle content. As a result, Na^+ dependent high-affinity active transport must occur in order to observe changes in the two compartments. (8) Increasing Na^+ concentration can activate $Na^+ – K^+$ pump, whose function is enhanced via insulin. (6) Several research papers confirmed an increased Carnitine content due to improved insulin response, based on both L-Carnitine ingestion and carbohydrates. (9) Similar results show that lower respiratory exchange ratio (RER) is related to an increased fat oxidation and decreased Lactate accumulation during high intensity effort. (10,11)

Short period oral supplementation effect over anaerobic effort has been insufficient documented as in report with other supplements.(12) Chronic oral ingestion of L-Carnitine can increase muscle carnitine and alter muscle metabolism during exercise. Yet, few similar results are published regarding acute oral ingestion and performance improvement. From a practical day by day perspective many athletes use one single pre effort oral serving. The effect is not fully documented over functional adaptions, lactate production or related energy metabolism changes. As we have seen though the published data, L-Carnitine can alter muscle metabolism during steady state exercise. (13)

Through our hypothesis we believe that non-mitochondrial ATP resynthesize is increased along with Carnitine acetylation, influencing lactate metabolism, and individual performance over single oral ingestion. Therefore, our aim will be to test the current hypothesis by monitoring performance indicators, during 30 seconds Squad Jump Test, after 4.5 g of L-Carnitine oral ingestion.

1. Method

3.1. Participants

Fourteen football players (n = 14) with a median age of 19 years old (18 – 22), 71 kg (65 – 74.5) median body weight of and 170.9 cm (168 – 176.5) height were recruited in the study by applying the following inclusion criteria: (1) male group, (2) aged between 18 - 25 years old, (3) residence in Târgu Mureş, Romania (4) enhanced effort capacity, (5) general health condition which allows the participation in high intensity effort, (6) participation consent. Study group exclusion was pre-set through the following criteria: (1) medical incompatibility with the pre-determined physical effort, (2) health condition that inhibits the study activity, (3) low effort capacity which alters the possibility to perform the test.

3.2. Materials

A group of football players were recruited to participate in an interventional study during January – February 2018. To perform the research we requested and obtained both the University Ethical Committee approval to conduct and apply the current methodology and the athletes' written consent to participate in the study. The present study was conducted in accordance with the ethics rules and research standards from the Helsinki Declaration of 1964 and its amendments.

3.3. Procedure

Study protocol consisted of two 30 seconds Squad Jump Tests (SJT). The test were conducted before (Test 1) and after one single oral supplementation dose (4.5 g) with L-Carnitine (T2). The athletes recorded a 7 – 10 day diet program pre T1 and T2 tests. Pre-tests the athletes were instructed to avoid caffeine, other supplements during the entire study period and to maintain an 8.7 g/kg Carbohydrate, 1.2 g/kg Protein and 1 g/kg Fat intake, while reducing effort intensity with 48 hours (≤75% of VO_{2peak}) and 24 hours (≤65% of VO_{2peak}) pre evaluation.
Of the fourteen subjects (n = 14) all of them were allocated to L-Carnitine ingestion after T1 test. The ingestion consisted of 4.5 g by using 2 g volume capsules, served during Breakfast, at 7:00 am. After 5 days, with restricted training conditions at 48 hours (≤75% of VO_{2peak}) and 24 hours (≤65% of VO_{2peak}), pre-test the athletes performed in T2 30 seconds SJT. In order to avoid circadian rhythm influence, T2 test began on the same day of the week (Thursday), at the same hour (10:00 am), after a similar food intake, similar training conditions and the same testing protocol, as described in Figure I - Figure II. Before and after each test lactate accumulation was measured.

Pre SJT assessment

Ten days before SJT (T1) athletes came into the Physiology Department for baseline measurements that confirmed individual capacity and health conditions. The screening consisted of general and surface anthropometry, Heart Rate (b/min), ECG, Blood Pressure (Systolic Blood Pressure, sBD (mmHg); Diastolic

Blood Pressure, dBP (mmHg); Mean Blood Pressure, mBP (mmHg)) and Blood Lactate (mmol/l). Anthropometry evaluation was conducted by using ADE taliometer (Hambrug, Germany) and Cosmed plicometer (Rome, Italy), while Careshine EKG-903A3 12-lead Digital 3-channel Electrocardiograph was used for ECG. Heart rate was measured by using Polar H7 device, Omron BPU321OS Blood Pressure analyser and Nova Biomedical, Lactate Plus (Waltham, USA) device for Lactate measurements.
Mean Blood Pressure was calculated by using the following formula:

$$mBP = \frac{sBP + (2 \times dBP)}{3}$$

General anthropometry

Body weight (kg) and inactive mass (%) were assessed during *pre SJT assessments*. The analyses were carried out using ADE taliometer and Cosmed manual plicometer, as described earlier. Durnin and Womersley (14) formula was applied to calculate inactive mass percentage (%) by using: bicipital (mm), tricipital (mm), subscapular (mm), and suprailiac (mm) skinfolds, represented as ($\sum 4ST1$). The body weight (kg), height (m), age (years) and gender (14):

$$\text{Body density} = 1.1765 - 0.0744 \log_{10}(\sum 4ST1)$$

During *pre STJ assessment* athletes performed the testing protocol for familiarization and tasks understanding.

30 Seconds SJT

By performing the test we analysed anaerobic power through: *contact time* (C*t*, seconds), *flight time* (F*t*, seconds), *height* (cm), *and power ratio* (Watt per kilo) by using OptoJump System. The test was performed over three reps (x3) each lasting 30 seconds. Recovery periods, lasting 60 seconds, were conducted after each repetition, as illustrated in Figure I, while maintaining *phase I* position (Figure 2).

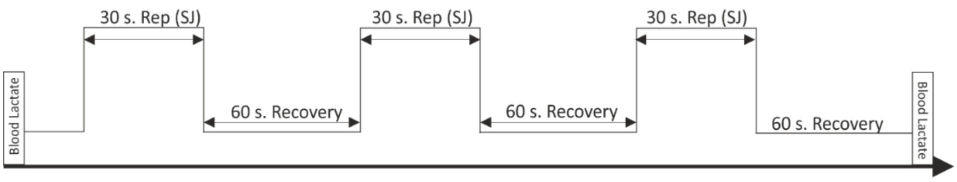

Figure 1. 30 seconds SJT testing protocol

Performance analysis was commenced by 10 minute warm-up that included both static and dynamic exercises of which intensity reached between 65 - 85% of VO_{2peak}, during short (5 – 20 s) high intensity intervals. In order to perform the test, the subjects were placed between the two OptoJump System device's arms with the legs width apart and hands on the hips. During each squad jump, the device recorded the height of the Target Centre (Height, cm), Ground Contact Time (C*t*, seconds), the Flight Time (F*t*, seconds) and Power Ratio (Power, watt per kilo). Tracking was performed in real time, stored and used in comparison during analysis, as shown in Figure 2.

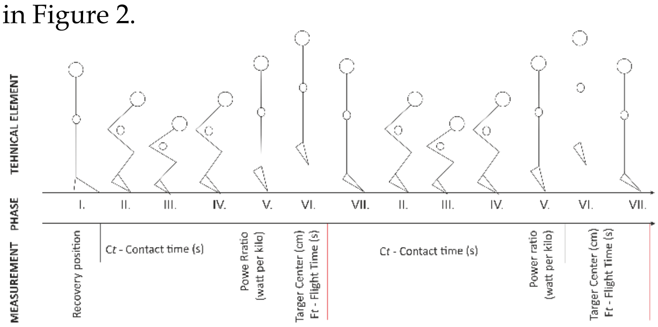

Figure 2. Illustration of 30 SJT measurements conducted during T1 – T2 tests

Statistical analysis

The statistical analysis were conducted by using SPSS 20. software. The level of significance was set at α=0.05. By using Shapiro-Wilk test the data was checked for normal distribution. All descriptive data were presented as Median, Minimum, Maximum and Interquartile Ranges. For inferential analysis, the Wilcoxon Signet Rank Test and Manova Test were used to analyse subjects' performance improvement over T1 and T2.

4. Results

Pre SJT assessment results

Subject median height was 170.9 cm (168 – 176.5). The body weight was measured at a median value of 71 kg (65 – 74.5), while inactive mass was determined at 13.97% (8.89 – 15.5). By using pre 30 seconds SJT assessments, sBP values were measured at 118 mmHg vs 113 mmHg during T1 vs. T2 SJT; dBP was measured at 60 vs. 66 mmHg. Median mBP was 81.67 vs. 85.3 mmHg, whereas median HR reached 73 vs. 72 b/min.

30 seconds SJT Performance Analysis (T1 - T2)

During T1 test, 1th rep contact time was 0.66 s (0.58 – 0.92). Changes were observed over the second and the third repetition: 0.63 s (0.55 – 0.94), 0.57 s (0.52 – 0.88). Contact time improvement was correlated to power ($p = 0.08$) without being linked to flight time ($p = 0.45$) or jump height ($p = 0.62$). Table 1. shows changes over T1 performance parameters.

Table 1. T1 performance analysis over 1th – 3th repetition

Performance analysis	1th Repetition	2th Repetition	3th Repetition	F	*p*
Tf, s	0.43 (0.38 – 0.48)	0.42 (0.40 – 0.46)	0.43 (0.38 – 0.51)	0.593	0.568*
Ct, s	0.66 (0.58 – 0.92)	0.63 (0.55 – 0.94)	0.57 (0.52 – 0.88)	19.19	0.001**
Height, cm	22.02 (16.5 – 23.8)	22.28 (20.35 – 26.86)	24.41 (18.5 – 32.14)	6.852	0.010**
Power, watt/ kg	17 (13.42 – 18.26)	17.40 (14.76 – 20.56)	17.97 (15.52 – 24.40)	7.669	0.007**

$^{**}p < 0.01$; $^{*}p > 0.05$

Basal Lactate measurement resulted in 1.2 mmol/l (1.1 – 1.5) value, whereas post effort a median value of 12.1 mmol/l (8.4 – 12.8) was reached.

During T2 30 seconds SJT, C*t* reached 0.69 s (0.54 – 0.80 s) without being significant differed from T1 value ($p>0.05$). Similar to T1, an improved performance was seen during second and third repetition: 0.65 s (0.50 – 0.78), 0.64 s (0.46 – 0.71). During T2 contact time was correlated to power ($p = 0.01$), flight time ($p = 0.01$) and height ($p = 0.01$), unlike T1 results. Significant changes were seen over flight, contact, height and power during T2 30 seconds SJT, as shown in Table 2.

Table 2. T2 performance analysis over 1th – 3th repetition

Performance analysis	1th Repetition	2th Repetition	3th Repetition	F	*p*
Tf, s	0.43 (0.38 – 0.48)	0.46 (0.42 – 0.50)	0.47 (0.41 – 0.53)	13.187	0.001**
Ct, s	0.69 (0.54 – 0.80)	0.65 (0.50 – 0.78)	0.64 (0.46 – 0.71)	11.400	0.002**
Height, cm	23.7 (18.9 – 29.2)	26.9 (21.7 – 30.7)	28.1 (21.2 – 35.6)	10.745	0.002**
Power, watt/ kg	17.8 (15.1 – 22.3)	19.2 (15.6 – 24.1)	20.6 (16.2 - 28)	7.181	0.009**

$^{**}p < 0.01$; $^{*}p > 0.05$

Lactate measurement during T2 resulted in 1.2 mmol/l (0.8 – 1.5) basal value and 12.9 mmol/l (9.4 – 14.5) in the end of the effort, reported as different in T2 as against T1.

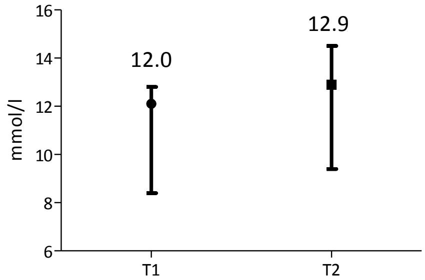

Figure 4. Changes in Blood Lactate in T1 and T2 (p = 0.028) - illustrated as median with range (min - max)

T1 – T2 Squad Jump Test Analysis

During T1, T*f* reached a median value of 0.42 s (0.36 – 0.51), unlike 0.46 s (0.38 – 0.53) during T2. Over T1, C*t* was measured at 0.60 s (0.52 – 0.94) as against 0.65 s (0.46 – 0.80) during T2. Associated values for height: 22.43 (16.55 – 32.14) vs. 26.92 cm (18.94 – 35.63); and power 17.17 (13.42 – 24.40) vs. 18.85 w/kg (15.13 - 28) were obtained, and illustrated in Figure 3.

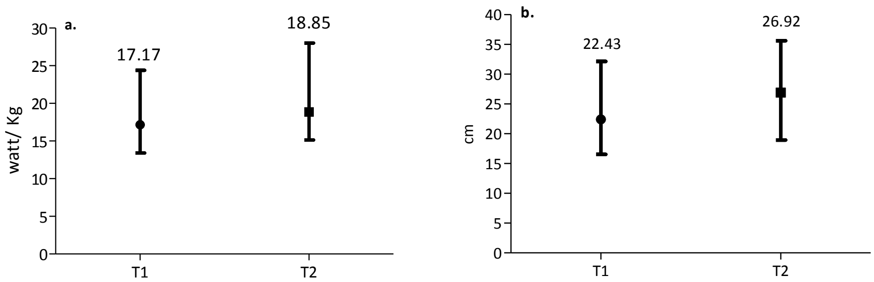

Figure 3. Changes between T1 and T2 over Power (p = 0.0001) (a.) and Height (b.) (p = 0.001) performances - illustrated as median with range (minimum - maximum)

Comparative changes were measured between T1 and T2. During T1, 1th rep, T*f* was not significant different (p = 1.00) from T*f*, T2, 1th repetition, as seen through 0.43 (0.38 – 0.48) vs. 0.43 s (0.38 – 0.48) and 0.46 s (0.42 – 0.50) values. Similar data was observed during 1th repetition between C*t*: 0.66 (0.58 – 0.92) vs. 0.66 s (0.58 – 0.92) (p=0.826). Changes regarding height and power during 1 - 3th repetitions are illustrated in Table 3.

5. Discussion and Conclusion

Performance during 30 seconds SJT was studied through Lactate accumulation and Power Ratio improvements over an anaerobic effort, conducted by trained participants. Through the applied methodology our objective was to minimize training influence over final results, similar to other research papers. (7)

Based on our outcomes, power ratio changed, unlike other outcomes which failed to identify individual performance improvements. (15) L-Carnitine is suggested to alter muscle metabolism during steady state exercise. (16) Various papers are published regarding endurance training while lack of specific data is related to high intensity and intermittent effort, as a result of one single L-Carnitine dose administration. (17,18) Topics related to L-Carnitine supplementation are covered through papers which confirm recovery improvements, cellular damage prevention and hypoxic stress regulation over chronic ingestion (3,12,19,20), as opposite to our findings.

L-Carnitine influence over high intensity Anaerobic Power Ratio and Blood Lactate Accumulation

Overall use of L-Carnitine ingestion over both low and high intensity effort is related to insulin response, (21) whose effect has not been studied in the current work. Over nine weeks of L-Carnitine supplementation changes were seen in Lactate response, oxidative stress and peak power during resistance training, unlike our findings over acute single dose intake. (22) Based on our outcomes, improved fat oxidation through increased glycogen storage which inhibits carbohydrate oxidation (5,6,23) can result due to chronic ingestion but unlikely due to acute L-Carnitine supplementation, as in our case. From a physiological standpoint, higher pyruvate dehydrogenase complex, due to maintain Coenzyme A (CoA), can improve Lactate accumulation and delay fatigue. (3) No similar findings were identified in our paper based on T2 response as against T1 30 seconds SJT.

Lactate accumulation during T2 30 seconds SJT was increased due to a reduced hydrogen ion buffering process, due to Lactic Acid breakdown. However, Leelarungrayub et al. published a paper which suggested that one single dose can improve blood Lactate response and pyruvate dehydrogenase activity, along with VO_{2peak} value, in comparison to our outcomes. (11) Yet, several papers failed to identify a drop in Lactate level despite changes in plasma and muscle Carnitine. (12)

Improved performances are related to Lactate accumulation and tolerance during effort. Based on Lactate increase in T2, one single dose administration will not induce L-Carnitine mediated improvements over pyruvate dehydrogenase flux and activation. Through Burrus M. et al. research, L-Carnitine supplementation, during lower Lactate levels, failed to influence RER value. (10) As we can see that the main effect is not entirely related to fatty acids oxidation, but to muscle Carnitine content. (24) This practical element can be further on confirmed through our nonspecific, anaerobic, testing protocol, which insures an anaerobic energy pathway, limiting fat metabolism while increasing Lactate accumulation, as against Majid Kashef et al. which reported a lower Lactate accumulation. (25)

We consider that the subjects' number and the lack of muscle and plasma carnitine measurement, represent study limitations. However, our study strength points were related to Lactate values, which were higher in T2 as against T1, despite performance improvement. Yet, pre-test training volume and intensity along with food intake, supplementation and recovery phase can influence the final result. Through the current study methodology, all influencing factors were standardized over T1 and T2 testing, as against other papers which studied chronic L-Carnitine supplementation. (25)

In future perspectives, the main outcomes, using a similar hypothesis will be included in a control and placebo double blind study, following several methodology changes: larger study group (1), more dynamic study group with participants from several sports fields (2), muscle and plasma Carnitine evaluation (3).

Conclusions

After one single L-Carnitine dose we obtained an improved power ratio and jump height during 30 seconds Squad Jump Test next to an increased Lactate accumulation. During the second test Lactate levels was higher unlike the first test, while an improved performance was seen during the second as against the first test. Through the current results, we conclude that an improved performance can be unlikely due to L-Carnitine, as seen through Lactate accumulation. Further on, we must take into account a possible effect over Lactate tolerance which might favoured improved performance over T2 unlike T1. Many other factors must be taken into account, including the placebo effect.

Acknowledgments

The authors of this paper state that there are no conflicts of interest regarding the hypothesis, objective, results or the conclusion drawn. The authors will like to thank the coaches and the athletes for their professionalism and involvement in the current research.

Modern Economic Research of Subjects of Investment and Construction Complex

Oleshko Danil Aleksandrovich student
Cherkina Vera Mikhailovna Lecturer associate Professor , candidate of technical Sciences
Moscow State University of Civil Engineering (MGSU) National Research University

Abstract

Investment and construction complex (ISC) is a system that is influenced by not only technological, but also organizational, marketing, process innovations.

The question of the subjects of the investment and construction complex is relevant, since it is the participants of the ISC who make decisions that affect the operation of the complex from the inside and, thus, they are one of the driving forces that change the industry.

In addition, human capital and organizational efficiency of the complex are the foundation of the transition to the knowledge economy in the construction industry. In the new economy also the role of determining the future, namely the implementation of innovative goals and objectives are put on the shoulders of participants of the investment and construction complex [8].

As a result of the study, the actual database of the subjects of the complex was supplemented by detailed scientific-theoretical, statistical and legal research. For the first time, subjects of ISC were considered at the junction of legal and statistical approaches. The positive dynamics in the legislative sphere regarding the investment and construction industry was noted. The institutional organizational innovation (consultant), aimed at improving the efficiency of the complex was revealed.

Key words: subjects of investment and construction complex, human resources, innovations, construction, consultant.

Introduction

The important role of the investment and construction environment stands out not only for technological aspects, but also for human capital factors. It is human labor at various levels of complexity that, with the quality interaction of groups of people bring profit to organizations, complexes, and the economy as a whole.

In the context of the transition to an information economy of knowledge, the role of human management and organization of activities becomes especially important: a faster response to changes is necessary. Qualified assessment of the possibility of introducing an effective innovation component due to market research, accumulated experience, technical and economic assessment of innovation implementation, its control at all stages of the investment and construction cycle, subject to certain periods and limited resources.

Scientists engaged in research of ISC are Asaul A.N., Dontsova L.V., Vakhmistrov A.I., Kazakov Yu.N., Ivanov S.N. and etc. The studies devoted to construction innovations are held by Alekseeva A.A., Asaul A.N., Zavarin D.A. et al., Fedoseev I.V. and etc.

The importance of labor and intellectual resources is revealed in the works of Armstrong M., Kapelyushnikova RI, Karlika AE, Platonov V.V. and etc.

Actualization of existing subjects of ISC will allow to organize effective management structures, due to which a possible way to solve the problem of insufficient development of innovations in the complex will be outlined, as well as the efficiency of the investment and construction complex will increase. To understand the laws of innovation and industrial development, the analysis of internal factors is crucial, so the author seems to be expedient to clear up the labor resources of the construction industry.

On the part of the labor resources indicator, there is a negative trend in the number of workers involved in the construction industry. There is also another significant drawback: the low level of staff skills, both from the workforce and from managerial positions.

The author proposes to solve the marked negative tendencies with the help of the organization of human resources. To this end, an academic analysis will be carried out in the work, which will make it possible to identify the subjects and institutions operating in the investment and construction complex and to determine their relations from the point of view of the institutional approach.
The author will analyze the regulatory legal acts, statistical data, as well as authoritative scientific sources. Thus, the analysis will be conducted using three approaches: legal, statistical and scientific-theoretical. For academic research and identification of subjects and institutions operating in the investment and construction complex and determining their relationship from the point of view of the institutional approach, the author proposes to analyze legal acts, statistical data, as well as authoritative scientific sources. Thus, the analysis will be conducted using three approaches: legal, statistical and scientific-theoretical.
1. Legal approach
For the period, 2013–2018 the state authorities carried out a thorough work on amending and supplementing the existing documents regulating investment and construction activities. The author singled out the most significant normative legal acts that concerned the construction industry [1–17].
On the basis of these documents, the author identified the subjects of the investment and construction complex, presented in Table. one.

Table 1. Subjects of investment and construction relations, according to the current regulatory legal acts

№	Subjects	Regulations according to the list above
1	Customer, customer-developer, developer, technical customer	1,3,4,5,6,7,11,12,15,16,17
2	General contractor, contractor(designer prospector), subcontractor, organization-contractor	1,4,5,12,13,16,17
3	Government of the Russian Federation/ state authorities of the subjects of the Russian Federation/ local governments/ executive authority/ organization of architecture and urban planning/ certification organization	1,3,4,6,10
4	Self-regulating organizations of cadastral engineers and their national associations/ self-regulating organization	8,9,14
5	Engineer, engineering organization, person engaged in the preparation of project documentation/ organization, engaged in the preparation of project documentation/ design organizations/architect	1,3,4,10,11,12,16
6	Investors, potential investors	13
7	Consumers of goods, works, services/ Consumers of produced goods works services/ users of investment activity objects/ users of capital investment objects	5,9,14,16,17
8	Landowners, tenants of land plots, owners of servitude, right holders of land plots, owners of land plots, land users	2
9	Work performers, suppliers, legal entities (banking, intermediary organizations, investment exchanges), other participants of the investment process/ construction organizations/other business or professional subjects/ credit organizations and financial organizations/ municipal complex organizations/agent/ person performing engineering surveys/ people involved in the design process, producing, building, installing, adjustment, operation, storage, carriage, implementation, utilization, disposal/ assistants consultants and technicians/ developer/ religious organization	3,4,6,9,10,11,13,14,16,17

A source. Compiled by the author

This table quite fully reflects the participants in the investment and construction industry. The author conducted a comparative analysis of regulatory documentation and came to the following conclusions.
The most significant participants are, as a rule, the user, the developer, the customer, the contractor, the person performing engineering surveys, the person preparing the project documentation, the surveyor, the architect, the designer, the investor, the participants in shared construction, self-regulating organizations [19, 21–24] .
However, the current legislative framework also identifies the following ISC participants:
credit organizations and financial organizations;

• developer;
• agent;
• persons involved in the design process (including surveys), production, construction, installation, commissioning, operation, storage, transportation, sale, disposal, burial;
• tenant of the property;
• assistants, consultants and technical staff;
• religious organization;
• organizations of the communal complex;
• body of architecture and urban planning;
• public authorities of the Russian Federation, public authorities of the constituent entities of the Russian Federation, local governments;
• consumers;
• owners, tenants, owners of land plots;
• other subjects of entrepreneurial or professional activity.

An unconditional and still unsolved problem is the lack of clear boundaries of terms and definitions. The majority of legislative acts are defined by the terms "and other", "and other" subjects of professional, construction, investment activity.

Thus, a unified approach to the definition of economic relations between the subjects of the investment and construction complex is absent. Because of this problem, end users of real estate objects often suffer.

The problem of definitions is significant, the formation of the investment and construction complex as a single system in the scientific and practical aspect is ahead of the description of interactions and relationships in legislation. Part of this problem can be explained by the contractual interaction of the participants of the complex, which gives, on the one hand, greater freedom for entities engaged in the investment and construction sector, on the other hand, it's difficult to encounter problems in the absence of a detailed description or no description of the mechanism for resolving the issue in the contract.

However, it is impossible not to note the positive dynamics in the legislative sphere - virtually all participants in the investment and construction activities, with the exception of the developer, are taken into account. This subject plays an important role in the construction and development of new areas. Often, this feature is included in the contract of the developer.

Neoinstitutionalism allows us to conduct a study on the grouping of the subjects of the complex within the framework of both formal (quantitative values) and informal impact on the subjects of relations in the investment and construction sphere.

It is difficult for the author to allocate revenue in accordance with the new structure of the All-Russian Classification of Economic Activities (RNCE (2)) due to the lack of statistical data, however, an analysis at the junction of the legal and statistical approach is possible and appropriate.

Thus, the author has compiled a table and analyzed the subjects of the investment and construction complex within the framework of the RNCEsystem (2) and legislative acts. The system of statistical classification of RNCE (2) is a tool with which today it is possible to describe both the construction industry and the areas interacting with it, since according to the RNCE (2): "if this activity is carried out for the operation of the constructed facilities, then all types of work relate to construction "[9].

The investment and construction complex is allocated not only through activity type F (construction), but also through other activities, such as mining (B), manufacturing (C), provision of electrical energy, gas and steam; air conditioning (D), water supply; water disposal, organization of waste collection and disposal, pollution control activities (E), construction (F), transportation and storage (H), information and communication activities (J), financial and insurance activities (K), operations with real estate (L), professional, scientific and technical activities (M).

The author, on the basis of the analysis, also highlights a new subject of activity, whose institute is only emerging in the investment and construction complex of Russia - a consultant. The activity on rendering consulting services, according to RNCE (2), is connected in a greater degree with design and architectural developments. (Pic 1)

Unit	Type of activity on RNCE	Allocated subjects of activity (according to Table 1)
B	Extraction of minerals	Suppliers: people, involved in the design process (including surveys), production, construction, installation, commissioning, operation, storage, transportation, sale, utilization, disposal
C	Manufacturing industries	Suppliers: people, involved in the design process (including surveys), production, construction, installation, commissioning, operation, storage, transportation, sale, utilization, disposal, organizations, responsible for preparing documents of the project; person, preparing documents of the project; suppliers, developers, person, who provides engineering survey, contractors
D	Provision of electricity, gas and steam, air-comditioning	Utility complex organizations, suppliers
F	Building	technical customer, developer, general contractor, organization contractor, subcontractor, self-regulating organizations, customers
H	Transportation and storage	People, taking part in the design process (including surveys) production, construction, installation, commissioning, operation, storage, transportation, sale, utilization, disposal, contractors, intermediary organizations
J	Information and communication activities	designers, consultants, technical workers, developers, intermediary organizations
K	Information and communication activities	real estate agent, investors, potential investors, credit and financial organizations, legal entities (banking, insurance and intermediary organizations, investment exchanges) and other participants of the investment process
L	Financial and insurance activities	Agent, property renter, credit organizations and financial organizations, owner of the property
M	Professional, scientific and technical activities	Other subjects of the entrepreneurial and professional activities, consultants, architectures, engineers (organization), consultants and technical workers, people or organizations, implementing engineering surveys

Pic. 1. Subjects of investment and construction relations, according to the statistical and legislative approach (compiled by the author)

However, for an investment and construction complex, the formation of this institution is of great importance from a transformational point of view - the emergence of such a subject as a consultant is an organizational innovation in the ISC.

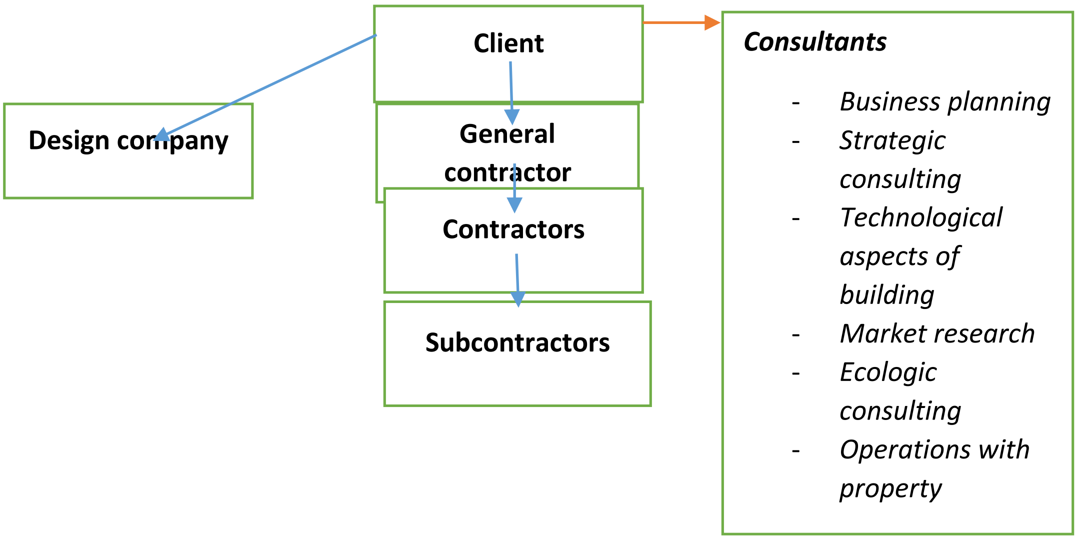
The market for consulting services in Russia, according to experts, is still stagnant. In the near future, the transition to growth can be realized at the expense of demand from customers from the agroindustrial complex, industrial and residential construction, who are encouraged to contact technical auditors and consultants by legislation "[3].

The major companies in the field of construction consulting are "Knight Frank", "Intertrest", "Olsa", "Smart-I", "2K", "Berkshire Technology", "Center for Independent Examination of Property", etc. [4] They carry out their activities in various areas in the field of construction, including assistance in strategic project planning, development of investment projects, technical aspects, design, green building, legal support in the real estate market and other types of consulting services.

In general, the turnover of consulting companies that for the period 2015–2016 provided reporting information regarding the construction complex is amounted to a considerable number, and was equal, respectively, 653, 9 million rubles and 1,132 million rubles. [4].

Then an expert survey was conducted among consulting construction companies, as a result of which it turned out that the services of consultants in the investment and construction complex of Russia are a popular and promising area, since 70% of companies believe that construction consulting services are in demand (7 out of 10 surveyed firms) 20% are in demand, 10% are not in demand.

In Figure 2, the author schematically depicts the organizational structure that reflects organizational innovation — the project consultant in the ISC. It can be seen that from the archaic form of interaction "customer-contractor" it is possible to degenerate into the form of "consultant-customer-contractor".



Pic. 2. Scheme for the use of consultants in various areas of activities in ISC as organizational innovation

The scheme proposed by the author makes it possible to optimize the activities of ISC subjects in conditions of limited labor resources and insufficient qualifications due to the introduction of consultants and the integration of their knowledge in the investment and construction sphere.

These intangible services (consultations, advice) help to make decisions at any project stage, while the awareness of specialist consultants allows not only to solve current problems, but also to introduce innovative products, materials, technologies into the construction cycle, thereby ensuring the development of the ISC from the point of view product and process innovations..

These innovations provide an increase in economic efficiency through reduced overhead costs, savings on transaction costs [7], i.e. bring economically positive momentum. In addition, the effectiveness of such an organization was proved by the data of the Doing Business magazine [12], which show that the involvement of private third parties (consultants) in the construction industry is associated with the best quality of construction, which was measured by the index "quality control of construction".

In fact, 93 of the 190 studied economies use some form of private third-party services in construction management. In high-yielding and upper-middle-income economies, 66.1% and 56.7%, respectively, use the services of consultants in managing construction activities, while only 37.7% of those with lower incomes use third-party services. , and only 25% of low-income economies use consulting services in the construction industry.

Based on the study, the author highlighted the following theses regarding the subjects of the investment and construction complex at the current economic stage:

First, they marked a tendency to reduce the number of participants in the investment and construction complex.

Secondly, despite the vagueness of the definitions of the subjects of the complex, the author notes a positive trend in the field of legislation - virtually all participants in the investment and construction activities, with the exception of the developer, are taken into account.

Thirdly, a new business entity was identified as a consultant. The promise of this direction in the construction industry is proved by the opinion of experts and a survey among the respondent companies involved in consulting conducted by the author together with the supervisor.

Fourthly, organizational innovation in ISC was proposed by consulting firms, aimed at improving the efficiency of the complex by optimizing the activities of ISC participants.

Abstract

This article presents the results of a computational and analytical study of the carrying capacity of various types of short piles used in low-rise construction. The relevance of the topic of work is determined by the current situation in the industry of individual housing. The most common pile foundations in this direction of construction are considered. Two alternative designs for the construction and technology of piling are proposed. A comparative analysis of the carrying capacity of the piles proposed by the authors with the most common variants was made.

The materials of the publication reflect the effectiveness of the proposed designs and the continuation of research work in this direction.

Keywords: low-rise construction, short pile, effective foundation, pyramidal-prismatic pile, bored pile with broadening, comparative analysis.

Introduction

The development of low-rise construction in our country in recent years has sharply gained momentum. The district building of three-five-storied apartment buildings is being carried out, cottage villages are being built up, private house-building causes great interest among urban residents [1].

In this connection, the task of increasing the productivity of work in this direction becomes urgent. One of the ways to increase productivity in low-rise construction, according to the authors, would be the introduction of new efficient foundation structures. So, if the cost of building a zero cycle for a multi-storey building, depending on the complexity of geological conditions, may be 5–20%, then for low-rise construction this figure reaches 15–30% [2].

In their desire to save at this stage, developers are increasingly turning to pile foundations. Different types of piles are used both in their design and in the method of the device. Nowadays, in the practice of housing construction, short, 3-4 m long, screw piles, bored piles, driven piles - prismatic and less often pyramidal - have found wide application.

In this article, the authors proposed options for improving the construction of piles, as well as a comparative assessment of the bearing capacity of short piles of various types in three types of soils. It should be noted that each type of piles has certain advantages and disadvantages. For example, the foundation of screw piles due to its low cost and ease of manufacture is widely used in the private construction of light wood houses (logs, timber, sip panels, frame houses, etc.).

Due to the fact that houses of this type often have low spatial rigidity, the transfer of horizontal loads to the foundation takes place. Due to the undeveloped lateral surface of the screw piles, which are also in the soil loosened by blades, horizontal slips appear at the foundation. Even if there is a good binding of piles in houses built on the ground works of this type, it is uncomfortable to live, due to the appearance of mobility of the building structure. Also worth noting is their low carrying capacity and susceptibility to corrosion [3].

In ramming piles, it is possible to note a low bearing capacity and the presence of loose soil residues in the well bottom, wet process, difficulty in monitoring the quality of the pile shaft, seasonal rise in price when the concrete is heated.

When applying prismatic driven piles, the disadvantages include loosening of the soil at the beginning of the dipping to a depth of one to two diameters around the perimeter of the pile, the formation of a gap clearance between the pile and the soil in the upper third when dipping.

The lack of pyramidal piles is that due to the inclination of the edges of the pile prone to pushing forces of frost heaving, swelling of soils [4]. In addition, there are difficulties mounting of the pyramidal pile to the driving unit.

The authors propose a number of ways to improve the shape and technology of the short piles. One of the most effective types of pile foundation construction for a private dwelling house is a bored pedestal pile.

In picture1 the sequence of the bored pile is shown.

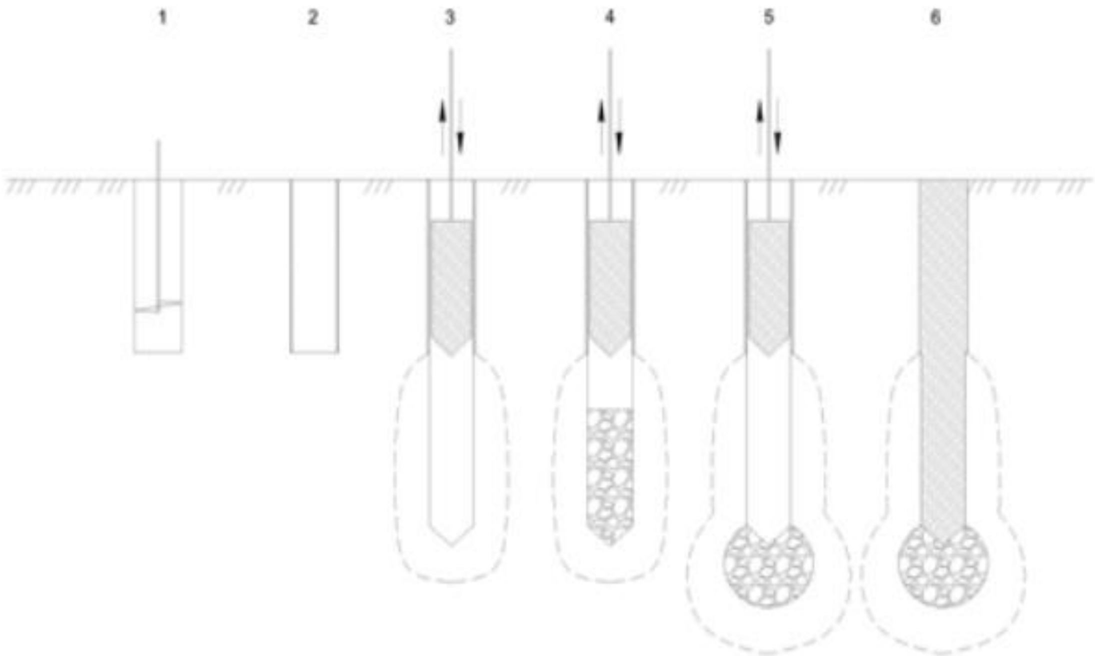

Fig. 1. Technological scheme
of bored piles with broadening:
1 - well drilling; 2 - installation of the casing;
3 - well punching to the depth of three-fold piles;
4, 5 - broadening by tamping coarse-grained soil or hard concrete mix; 6 – piles

The advantage of the proposed technology is as follows:

- as a result of holing, zones of compacted soil are formed with elevated values of strength and deformation characteristics;

-in the process of ramming of crushed stone or hard concrete mix, a broadening diameter of 1.5–2 times the diameter of the pile is formed;

- transfer of the load from the piles to the foundation, both on their base and on the lateral surface, occurs first to a more durable and then less durable soil material while simultaneously increasing the interaction area of the more durable material with the less durable [5];

- the use of casing eliminates the need for a device with a rail for a tamping beam.

The ratio of the diameters of the well, casing and tamping can be taken as 450: 425: 375 mm. The height of the tamper is selected for a given weight. The use of punching a well to a depth of more than three diameters brings the bearing capacity of a ramming pile to a driveline.

In the opinion of the authors, the next effective type of pile foundation construction in low-rise construction is the use of a driven pyramid-prismatic pile. The pile structure is a combination of a prismatic pile in the lower part and a pyramidal pile in the upper part.

The proposed design allows:

- to increase the bearing capacity of the pile due to the inclined edges and more developed lateral surface. The increase in bearing capacity of the pile with broadening in the upper part occurs as a result of soil compaction during its driving, and because of the specificity of the interaction between the pile and the soil under load, such piles constructions compact the soil within the compaction zone, which is especially effective in macro porous soils.

Thus, the bearing capacity of piles with broadening at the top largely depends on the characteristics of the compaction zone. The bearing capacity of such structures increases not only by increasing the area at the tip, but also by changing the working conditions of the soil along the side surface of the pile and the friction force, which is implemented to a greater extent [6].

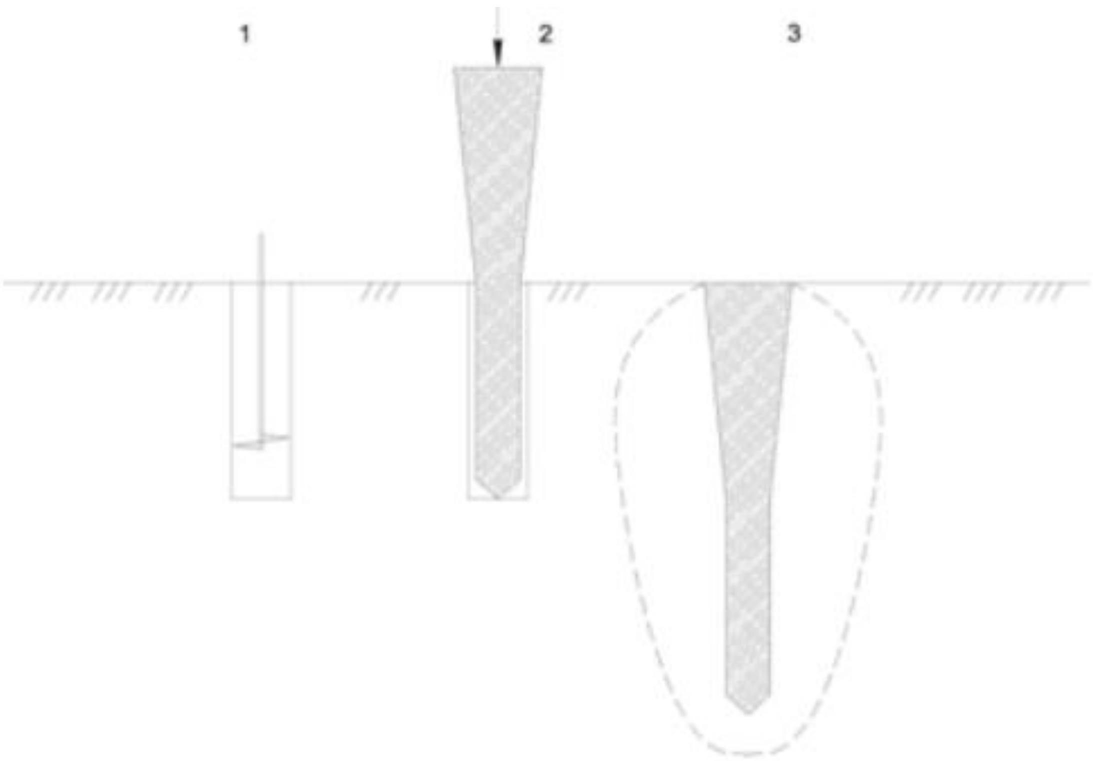
According to the data obtained by experimental and computational methods [7, 8], this kind of broadening gives an increase in the carrying capacity in 1.5–2 times, depending on the size of the head;

- to eliminate the possibility of piling the pile by the forces of frost heaving due to pinching of the prismatic part in the thawed soil, which makes it possible to apply this design above the depth of seasonal freezing of soils;

- to facilitate the process of dipping piles due to the fact that the pile is installed in a pre-drilled well and already from this position is clogged.

The offered technology will solve the problem of fixing the pyramidal part of the pile in a vertical position [9].

In pic. 2 the sequence of the construction of a pyramidal prismatic pile is shown.



Pic. 2. Technological scheme of the pyramidal-prismatic pile:
1 – drilling of a well to a depth corresponding to the length of the prismatic part of the pile;
2 - installation of the pile in the well;
3 - pile driving.

Below there is a comparative assessment of the various structures of piles in three soil conditions - semi-solid loam, refractory and soft-plastic consistencies.
The calculation of the bearing capacity of the piles on the ground, the amount of spent material is found. To determine the effectiveness of the type of foundation used, a comparison was made of such a parameter as the specific bearing capacity of the pile, calculated using the formula

Fspec. = Fd / V,

where Fspec- specific bearing capacity, kN / m3;
Fd - pile bearing capacity, kN;
V - pile volume, m3

The calculation of the bearing capacity of the piles is made using known formulas in accordance with the recommendations of design and construction specifications 24.13330.2011.
The "determination" of the carrying capacity of the ramming part was carried out according to the formula:

$$F_d = F_{dR} + F_{df1} + F_{df2},$$

where FdR is the bearing capacity of the base under the lower end of the pile, kN;
Fdf1 - soil bearing capacity along the side surface of the pile in the drilled area, kN;
Fdf2 is the bearing capacity of the soil along the lateral surface of the pile in the broken section, kN.
To calculate the carrying capacity of a pyramidal prismatic pile, the following formula is offered:

$$F_d = F_{dR} + F_{df1} + F_{df2},$$

where FdR is the bearing capacity of the base under the lower end of the pile, kN;
Fdf1 - soil bearing capacity along the side surface of the pile in the prismatic area, kN;
Fdf2 is the bearing capacity of the soil along the side surface of the pile in the pyramidal section with a slope of the side faces ip> 0.025 g units, kN.
In table 1 the results of determining the bearing capacity of various types of short piles are presented, including those proposed by the authors. The table is compiled for three types of ground conditions.

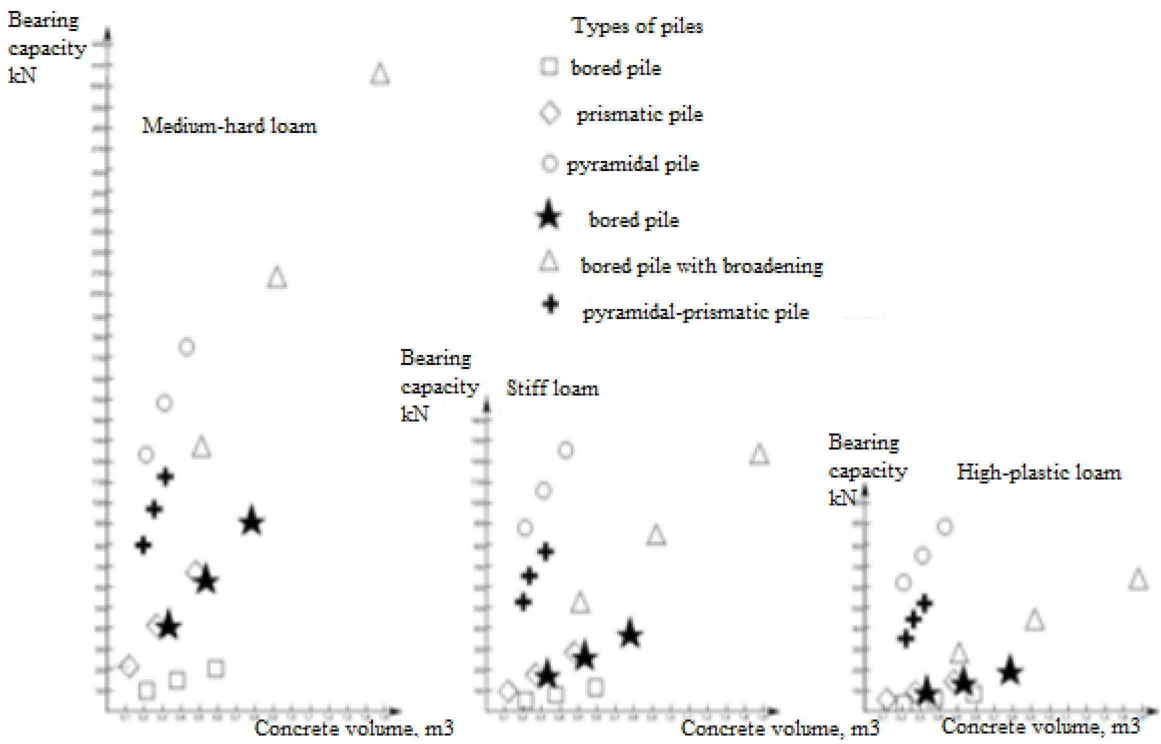
To visualize a comparative assessment of the considered structures of the foundations, the dependencies of the bearing capacity of piles on the consumption of concrete were constructed. As can be seen from the graphs (Fig. 3), the most effective in terms of the ratio "concrete consumption - bearing capacity" is a pyramidal pile, followed by pyramidal-prismatic and ramming pile with broadening for all types of soil.



Pic. 3. Graphs of the bearing capacity of piles from the consumption of concrete

On the basis of the results of the comparison, and also taking into account the fact that the use of pyramidal piles is limited by the depth of seasonal freezing, it can be concluded that the proposed designs of the pile foundations are highly competitive.

The proposed types of foundations will significantly reduce both labor and material costs in individual housing construction due to the relative simplicity of the construction, less consumption of materials and, at the same time, increased bearing capacity compared to other types of pile foundations.

Abstract

In this article the effectiveness of a new technology - a concrete 3D printer is considered. The creators of this equipment claim that it can save a significant amount of money when used for building construction. This study examines how a 3D printer can save the time that is necessary for building a framework, and how this may affect the overall design cost.

In addition, in the article, you can see the results of the calculation of labor and material costs for two types of houses: printed on a 3D printer and made of blocks of cellular concrete. Moreover, the percentage of profit, based on the potential time, the savings and the total cost of a one-story building were calculated.

The study concluded that 3D printers would be beneficial for construction companies engaged in large-scale low-rise construction.

Keywords: building structures, 3D printing in construction, section, low-rise construction, fiberglass, composition, and reinforcement.

Introduction

Currently, construction is the only fully non-automated industry. Human involvement is quite large at various stages of the construction process, resulting in reduced yields, increased error probability, work costs, construction project costs and risks. 3D printing is one of the most advanced and promising technologies to date, which recently began to be used for printing building structures, apartments and houses.

The relevance of this study lies in the fact that the use of this technology will allow optimizing high work processes, reducing construction costs and risks associated with industrial injuries.

The use of 3D printers in the construction process is relatively new, and is considered in the article written by N.S. Mustafin, E. A. Sorokina, A. V. Ivasyuta, K. W. Jumambetskov [1-4].

The main advantages are the reducing the duration of construction and increasing the level of work optimization. On the other hand, the impossibility of using vertical and full reinforcing bars can be considered as a disadvantage, since it leads to decreasing in the strength of such structures. 3D printers require special concrete mix [6], either for layering; development of regulatory documentation and solving problems with reinforcement structures [7, 8].

Russian engineer Andrei Rudenko claims that in terms of strength and quality, printed apartments are not inferior to monolithic structures. In cold climates, hollow walls can be used as a fixed formwork for foam concrete with enhanced thermal insulation properties [9].

Pic. 1. 3D Printed Villa made by the company Sanghai WinSun [11]

A few years ago, 3D printing began to be used by large companies, such as Shanghai WinSun [12], mainly for low-rise residential buildings. They were the first to build a 5-storey residential block and a country villa using this technology (Pic. 1).
According to company representatives, during the experiment the savings achieved amount of about 60% of building materials and about 30% of the time required for the construction of such an object, using traditional methods.
In addition, the construction crew was reduced five times, which means saving and reducing the risk of industrial injuries. The material used was a mixture consisting of cement, fiberglass reinforced fiberglass, reinforced plastic, sand and a special hardener. The walls of such houses are almost hollow, and the strength and stability of the structure is ensured by the zigzag supply of the mixture inside such walls [13].

Pic. 2. Apis-Cor 3D building printer (2016) [15]

The modern market of construction machinery and equipment has a large variety of construction printing equipment that allows you to create low-rise buildings of various configurations [14].
In a short period of time, 3D printer designs have evolved from large massive designs [14], to the newest compact model that allows the construction process inside the building. In 2016, the Russian company Apis-Cor introduced such a printer (Pic. 2).

Its dimensions are as follows: 1.6 meters in diameter, 1.5 meters in height, with a boom reach of 4-8.5 meters and a weight of 2.5 tons. This printer works by twisting around its axis and building structures up to 132 m2. The operation speed allows printing up of a 100-m2 house for 24 hours.

The developers of the company also created their own fiber-reinforced concrete, and received the appropriate quality certificates, according to which it corresponds to the strength of ordinary concrete with a B20 mark and a water resistance of W6 [16].

Concrete with such technical characteristics is superior to previously used analogues with a lower strength of 1.6 MPa [5], which makes it possible to use it in construction without reducing the quality. The use of fiber-reinforced concrete as a printing material, reinforced with steel or fiberglass, helps to partially solve the problem of lack of reinforcement and protect the building from moisture.

There is a possibility of horizontal reinforcement laying of reinforcement or flat ARMO frameworks between product layers during printing [7]. In Russia, the development of new materials requires thorough and long-term testing, which is accompanied by long-term certification and research processes.

This requires not only time, but also very significant funds [17]. Studies in the relevant literature have shown that 3D printing of buildings is especially effective in low-rise buildings. In this regard, we compare two methods of low-rise construction: a house that was made of aerated concrete blocks and one that was printed with the help of a 3D printer.

The purpose of the study is to analyze the effectiveness of the implementation of 3D printing in construction, its impact on the cost and time of construction. For this it is necessary to achieve several goals:

1) to study possible applications in construction and learn about the necessary machines and materials
2) to study the existing technologies of analog construction and identify the most used
3) to conduct a comparative analysis of the use of 3D printing and the most common building technologies using an example of a building model with the same planning solution in terms of time and cost
4) to conclude how the introduction of 3D printing helps to optimize the construction process.

The most common materials in low-rise construction are wood, brick, reinforced concrete and aerated concrete, concrete block. The duration of the construction of buildings made of brick and monolithic reinforced concrete is longer than that of logs and aerated concrete. Houses made of logs are built much faster, but at the same time much more expensive than those built from aerated concrete. In addition, aerated concrete has good thermal insulation properties and it is considered to be inexpensive in the market of building products [18].

The walls of such masonry are built with maximum speed and is widely used in low-rise construction. In this regard, for comparison, we chose just such a design of external walls.

When printing 3D-objects, the printer uses a layer-by-layer structure construction method. This construction work begins with the installation of the printer on the construction site, and then a solution is prepared from special concrete. It consists of cement, fiberglass or other materials, as well as a special thickener.

Next, the printer feeds the mix mortar from the nozzle and the necessary construction is carried out in layers. Thus, in the same way, the entire frame of the building is gradually built, starting with the foundation and ending with the walls. When printing an object, part of the job cannot be performed by the printer. The whole complex or cosmetic processes, such as laying communications, installing doors and windows, roofing, exterior and interior decoration are done manually. Despite this, the group of workers can be reduced to 2-4 people [8].

To find out how the implementation of 3D printing is consistent, it is advisable to compare the time and money spent on construction using the most popular analog technology for the construction of a one-story house. To calculate the amount of work and materials, a one-story house was chosen with the following dimensions:10m x10m and an area was of about 100m2 (Pic.3).

A comparison of the structural elements: formwork, foundation, exterior walls, interior walls, installation of floors, ceilings and roofs was held. The costs for installing the communications and engineering systems are not taken into account.

It should be noted that a 3D printer can immediately print walls with corresponding holes for pipes and electrical wiring. The labor intensity and material intensity of earthwork operations were not taken into account, because this type of work is performed in the same way. To calculate the labor costs and construction time, we were guided by the state elementary estimates [9], average prices in the modern labor and materials market. Construction calculator was used to calculate the amount of material. The foundation in both cases is tape-shaped, is made the same, with the exception of formwork.

In the case of building a house using the traditional method of aerated concrete, when pouring the foundation, as a rule, removable wooden formwork is used, which workers build within a few days. The 3D printer makes it possible to create a permanent formwork with already laid reinforcing mesh in just 1 hour. This amount of concrete poured into the formwork is the same in both cases — 16.1 m3.

In the case of a gas concrete house, the walls are constructed from rectangular aerated concrete blocks with a density of D600. The height of the walls is 3m. After construction is completed, the enclosing walls are insulated with mineral wool 100 mm thick. Ceramic granite is used as a facing material. The blocks are connected to each other using an adhesive mortar mix.

Pic. 3. Layout of the house

The floor is made of wood. The ground is leveled, the sand is compacted, then the lags are installed, which are supported by the foundation, the panels are installed on top of the log. After that, waterproofing and floor insulation is completed.

Attic overlap is made of 50x200mm glued timber with a 300mm pitch; thermal insulation and sound insulation are completed after that. The roof is duo-pitch with a slope of 15 degrees, the roof is made using metal tile.

Now let's take a closer look at how the design is performed using a 3D printer. Printing of the walls of the house is made layer by layer. Each layer is printed first along the contour, and then a zigzag lacing is printed in the cavity of the bearing walls for greater strength and stability.

Through every 10 -16 layers, the worker places the longitudinal reinforcement. First, printing of bearing walls is held, then installation of prefabricated floor slab structures is done, and the last stage is printing. The required volume of fiber-reinforced concrete is being calculated, such things as the house plan, wall thickness, hole dimensions and layer thickness are taken into account by printer diffusers. During printing of transverse reinforcement of d = 10 mm, 50 cm intervals are set around the perimeter every 40 cm height.
From the point of labor costs for printing walls and foundation formwork, only 2 specialists are required: one is for a 3D printer driver and one is as an assistant. Printing bearing walls are produced during one work shift. During the next shift, the installation of the wooden floor is completed. During the third shift, the sections are printed and the house is finished.

When using a 3D printer, reinforcement during the foundation process is simpler, since it can be put lengthwise: a reinforcing mesh, without tying. This allows you to reduce the time to establish a complete framework and the corresponding labor costs. In the case of building a house in the usual way the use of fixed foundation formwork is allowed. As for this house, it will cost at least 27 thousand rubles.
However, when it comes to erecting the entire cottage village, it is more profitable to purchase one folding formwork, which can be reused on other typical objects.
The advantage of time and cost, excluding the cost or rental of equipment for construction is not more than 25%. As for frameworks for the foundation, it will be about 20%. Printer manufacturers claim to save the total cost of 15% due to foundation work. In accordance with the calculations, the savings from this type of work amounted to 5%. The greatest savings are achieved using wall construction — 18% of the total cost of the house, while manufacturers of the innovative Apis-Cor printer claim that it is possible to save up to 25% on a frame structure [6].

If we separately consider the savings at specific stages of construction, the savings on the foundation are up to 50% in cost and up to 40% in time. Wall printing on a 3D printer saves up to 80% of the cost of this type of work, while performing them three times faster. At the same time, the creators of 3D printers are developing their technology and building structures as close as possible to existing standards of concrete products for durability, stability and quality.
Based on the proposed prices on the market of construction equipment, the average cost of a 3D printer can be 2 million rubles. If a construction company acquires it for the construction of a cottage settlement or a private low-rise building, taking into account the savings on each house of 370 thousand rubles the printer will recompense for itself when building the sixth house.

From the saying above, the following conclusion should be drawn:

1) Research has shown that the introduction of a 3D printer can be very useful for construction companies. In the best way, now, the printer shows itself in low-rise construction. It can also be effective in cases of the need for urgent construction of temporary housing after natural disasters.
2) Among the existing analogs of houses in low-rise construction, aerated concrete is closest to the price and temporal characteristics of a 3D printer, optimal for comparative analysis.
3) The comparative analysis showed that for private construction, the use of this technology, taking into account the lease, could be beneficial only in terms of construction time; the costs will remain about the same.
   In the future, for construction companies, this technology may be effective, as it will optimize the production technology.
4) 3D printing technology will allow building faster and saving up to 23% of construction costs and up to 25% of construction time when taking into account the construction of a one-story cottage without interior decoration and installation of utilities.

Abstract

Currently, the construction industry is characterized by a gradual increase in requirements for the quality of work, economic efficiency and the external appearance of the object. Works on the arranging of the exterior finish are the final stage of construction. Their purpose is to protect structures from the harmful effects of the environment, increase service life and provide an attractive appearance.

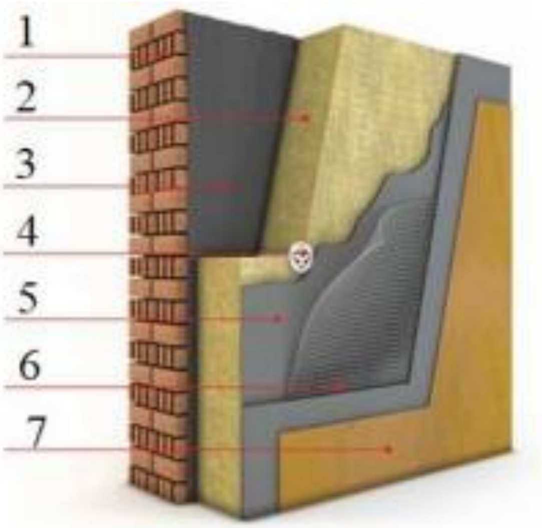
The article presents a comparative analysis of the technological features of the arranging and the operating of two the most common facade systems for external thermal insulation: with finishing ("render" facade) and a protecting structure with a ventilated air layer (suspended ventilated facade). The following parameters, such as the operational efficiency of the facade systems used, the specifics of their design, and the fire safety of the materials used in constructing facades of render and suspended types are compared. The cost of installation work on the facade and the cost of the necessary materials are given.

Keywords: façade of "wet" type, suspended ventilated facade, facade design, features of arranging, operational efficiency, heat insulation layer, fireproof insulation.

Introduction

Each architect seeks to make his design of the object individual through the geometry of a building or structure, as well as various types of exterior decoration. Facade systems for exterior insulation with plaster and a system with a ventilated air layer have become widespread [1]. "Render" facade is a multi-layer construction used for exterior finishing with simultaneous wall insulation. Its main components are heat insulating, base and decorative layers [2].

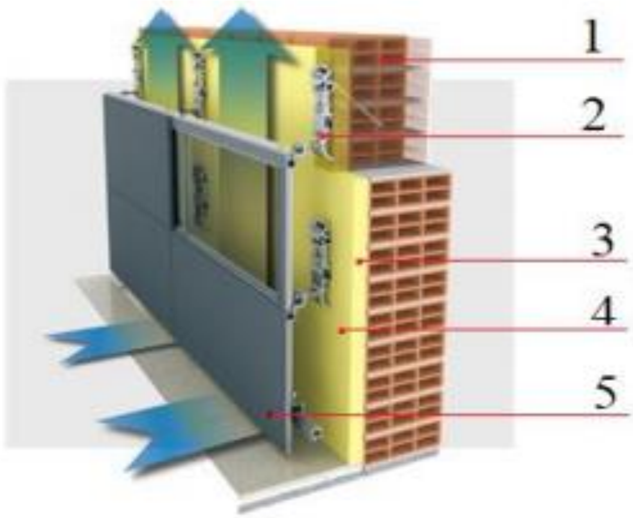
The constructive scheme of the "wet" facade is shown in Picture 1.



Picture 1. Scheme of the structural elements of the wet facade: 1-bearing wall; 2 mineral wool plates; 3-adhesive composition; 4-dowel; 5- base layer of plaster; 6-fiberglass; 7-decorative plaster layer

Wet facade insulation systems were invented in Germany in the 50s of the last century, but it was widely used only in the 70s [3]. The facade with "wet" plaster is used in the construction of public, industrial, low-rise buildings [4].

Suspended ventilated facade is a system consisting of a load-bearing wall, a support bracket, insulation, air gap and a decorative screen that is mounted on a metal support profile [4].
The constructive scheme of the "suspended" facade is shown in Picture 2.



Picture 2. Scheme of the structural elements of the "suspended" facade: 1- load-bearing wall; 2- support bracket; 3- insulation; 4-protective membrane; 5-decorative screen.

Ventilated facades in Russia began to be used relatively recently. Over the past 10 years, more than 4 million exterior wall insulation systems have been used, using the structures of ventilated facades [5]. Their advantage lies in the fact that they can be constructed in almost all climatic regions.
Suspended ventilated facades are used as exterior insulation for public buildings, high-rise residential buildings, as well as for buildings with a complex configuration. Thanks to a wide range of cladding materials, it is possible to create original architectural solutions of various types and shapes [6].
The main characteristic of facade systems with external insulation is operational efficiency, which is understood as a maintenance-free period of using the structure while maintaining its basic parameters that ensure the functional purpose of the object [4].
For a wet facade, the main factor affecting operational efficiency is the durability of the thermal insulation layer. High-density materials are the most resistant to the wearing process.
Expanded polystyrene (density is 15 kg / m3) is often used as a "wet" facade insulation, which causes deterioration of performance characteristics.
Mineral insulators have the best characteristics (density is 40-60 kg / m3), but they are used less frequently due to their high cost [2]. Thus, the actual lifespan of wet facades can range from 5 to 35 years. The relatively short lifespan of a "wet" facade is also explained by the fact that a thermally insulating contour is created on the wall surface, which prevents the air from functioning inside the structure, which leads to "aging" (physical wear) of the heat-insulating layer.

For the suspended ventilated facades technology, the average effective life is 50 years. The hinged facade, by analogy with the "wet" creates a continuous insulating circuit. The main difference lies in the fact that the moisture passing through the carrier part of the wall enters the insulation, then, due to the air gap and frequent inflow of air, is removed from the insulation to the atmosphere. As a result, the insulation in any period of the year remains in the regulatory-humidity regime, which increases the efficient use of the structure.

Insufficient thickness of the ventilated layer may affect the over-moisture insulation, as moisture will not be fully removed from the thickness of the structure that will lead to the destruction of the insulation layer [7]. When choosing the type of facade system, it is necessary to take into account the fact that the design of the frame of the ventilated facade, which is often made of steel, may be subjected to corrosion. This disadvantage is excluded when installing the "wet" facade.

The most time consuming procedure in the creation of a building envelope is its installing. The distinctive feature is that when installing the wet facade, the decorative mixture is applied by mechanization using special equipment for the supply and application of the solution.
In turn, the process of facing the building with a suspended ventilated facade is carried out manually, which significantly increases installation time and labor costs.

The facade of buildings and structures should not only provide an attractive appearance and operational efficiency, but also meet a number of regulatory requirements. The main one is fire safety. “Wet” facade in terms of fire safety has an advantage over ventilated.
To reduce the risk of ignition of objects with plaster finishing, it is necessary to use a non-fire hazardous mineral-cotton insulation, which, according to the technical regulations on fire safety requirements (Article 10 of the Federal Law No. 123 dated July 22, 2008), belongs to fire class K0 and has a flammability group G1 (slightly inflammable).
It is also possible to use polystyrene foam as a heater, but with using fire-prevention dissecting made from mineral-cotton since expanded polystyrene is a fire-hazardous material and has a flammability group G4 (highly flammable) [8].

In other words, the use in the construction of external walls with facade thermal insulation of mineral-cotton insulation, along with the protective and decorative layer, contribute to increased fire safety.
In designs with a suspended facade, the presence of a non-combustible or low-combustible insulation is not the only factor affecting fire safety. This is because the structure itself provides the presence of a wind- and moisture-proof membrane, which can be a material with a flammability group G2 (moderately combustible) and which is attached directly to the insulation. Considering the fact that air circulates in the structure at an average speed of 2 m/s, in case of fire, a fairly rapid violation of the integrity of the entire facade will occur [5].
In order to eliminate the possibility of large-scale ignition of the object, it is advisable to use non-flammable wind-hydroprotective membranes, which include fiberglass impregnated with fluoropolymer (fire-resistant material), or use additional compaction in the form of mineral-cotton of high density (150 kg / m3 and higher) [4].

The cost of the installing considered facade systems also have significant differences. Tables 1 and 2 show the cost of installation work of "wet" and suspended ventilated facades of an area of 1 m^2. Tables 3 and 4 show the price range of materials required for the installation of a “wet” and suspended ventilated facades of an area of 200 m^2.
The tables are compiled according to the data of Perm companies LLC “Fasad-Perm” [9], engaged in plaster finishing of buildings, and LLC “Fatsia” [10], which deals with ventilated facades.

Table 1 - The cost of the work of installing the "wet" façade

Name of service	Unit of measurement	Cost, rub.
Priming of walls (2 layers)	m^2	50
Installing of thermal insulation	m^2	150
Installing of adhesive-reinforcing layer	m^2	200
Application of decorative plaster	m^2	250

Painting (2 layers)	m^2	150
Installation, dismantling of scaffolding	m^2	50
In total		950

Table 2 - The cost of the work of installing the suspended ventilated façade

Name of service	Unit of measurement	Cost, rub.		
		Stainless steel sheet	Metallic panel	Composite
Subsystem mounting	m^2	500	450	400
Vapour barrier	m^2	80	80	80
Insulation of laying	m^2	150	150	150
Installation of windscreen	m^2	80	80	80
Installation of facing	m^2	200	1110	1115
Covering of protruding parts, slopes	rm	250	250	250
Installation, dismantling of scaffolding	m^2	50	50	50

Table 3 - The cost of materials for the installing of "wet" facade of 200 m^2

The work performed	Name of material	Cost, rub.
Attaching the insulation	universal primer	629
	glue	329
	dowel	1779
Heat insulation layer	polystyrene foam	226 394
	mineral cotton	2 059 794
Base layer	glue	439
	facade reinforcement mesh	2119
	PVC profile-drip with reinforcing mesh	129
	plastic corner with mesh	49
	window profile with mesh	95
Priming for decorative plaster	primer "Primer"	2199
Decorative layer of plaster	plaster	
	mineral	329
	silicate	15 559
Paint coating	exterior paint	
	acrylic	2995
	polymer	37 779
In total	Maximum	237 485
	Minimum	2 122 009

According to Table 3, it can be seen that the minimum and maximum cost of materials for installing of a "wet" facade and suspended façade differ almost 9 times and 5 times appropriately. This cost difference depends on:

- type of insulation material;
- quality and composition of fasteners;

- type of material for the decorative layer ("wet" facade);
- type of facing material.

The choice of cheap materials may adversely affect the operational efficiency of the facade system, which will lead to the need to perform premature repairs and invest additional money. Thus, in the long run, from an economic point of view, it is more advisable to use high quality, expensive materials [11].

The minimum cost of a suspended façade differs from the cost of a "wet" facade in external insulation by 2 times. This is due to the use of expensive cladding materials and metal fasteners.

The use of stainless steel clamps, which are not susceptible to corrosion and increase the service life of the facade system, has a particularly noticeable effect on the total cost of the suspended ventilated facades.

The maximum cost of a "wet" facade in terms of external thermal insulation and suspended ventilated facades differ slightly due to the use of expensive polymeric and silicate materials for a "wet" facade, which are comparable to the prices of suspended ventilated facades materials.

A separate component of facade systems is the cost of installation work, which is presented in Tables 1 and 2. For suspended ventilated facades, this criterion is 1.5–2.3 times higher compared with the cost of work on the construction of a "wet" facade. This is due to the complexity of the work and time-consuming when installing suspended ventilated facades because of the element-by-element manual assembly of all layers of the system.

The analysis of the features of the external thermal insulation of structures using suspended ventilated and "wet" facades showed the advantages and disadvantages of both systems. To create a reliable, durable and aesthetic facade, one must comply with the requirements of the relevant regulatory documents. It is necessary to consider the purpose of the building or structure being constructed, the climatic characteristics of the construction area.

Quality, well-selected materials will allow to avoid adverse effects on human health, as well as unforeseen financial costs.

Abstract

One of the main prerequisites for the successful solution of capital construction problems is its further industrialization. Existing ideas about the construction of structures made of monolithic concrete is based mainly on the experience of the construction of flatwork systems. The technology of a monolithic concrete dome can be considered as the construction and erection of permanent structures. The most common option is the arranging a monolithic dome with the use of pneumatic formwork.

The purpose of this work was to describe the method of using pneumatic formwork systems for the construction of monolithic structures.

The Russian Federation is increasing its presence in the Far North, and in its military doctrine considers the development of a rich mineral region - the Arctic to be a priority.

This article discusses the construction technology of pre-fabricated dome structures in the conditions of the Far North, their advantages and disadvantages are assessed.

The subject of the research is reinforced concrete dome structures and possible prospects for their use in the interests of the Ministry of Defense of the Russian Federation.

Keywords: pneumatic formwork, dome, hemisphere, reinforced concrete, shotcreting, gunned concrete, the Far North, construction, dome structure, dome.

Introduction

Nowadays, modern technologies and building materials, which practically do not differ from bricks, are popular. One of these structures are spherical or domed houses.

The use of pneumatic forms allows, in accordance with industrial requirements, to erect spatial structures from monolithic reinforced concrete. [2, p.37]

Monolithic dome housing has the following advantages:

“Thanks to the high-tech construction, the monolithic dome house is built quickly and does not require heavy construction equipment, which significantly reduces the cost of construction work.

- Saving building materials is up to 20% at all stages of construction.
- Spherical shape is energy saving system
- Increased strength, which is due to a uniform distribution of the load on all points of the surface.

In accordance with the technology of construction of monolithic domed houses, at the initial stage of construction, the fundamental layer and the blind area are being prepared.

The base layer consists of a sand cushion, waterproofing, reinforcement. As a heater, expanded clay cushion is used. The blind area, concrete, 800 mm wide, is part of the foundation.

The process of building monolithic reinforced concrete structures is complex and consists of

- installation of formwork system;
- reinforcement work and installation of embedded parts;
- laying and compaction of the concrete mix;
- care of concrete (moistening - in the summer, warming - in the winter), set of stripping strength;
- demoulding.

After disintegration, a monolithic “stone wool” shell and shotcreting with a finishing layer are provided.

The walls of the monolithic domed house consist of three layers:

- monolithic concrete is 80 mm, its density is 2000 kg / m3
- basalt wool is 100 mm, its density is 130 kg / m3

- finishing layer of shotcrete, concrete is 20 mm, its density is 2000 kg / m3

In accordance with the construction project, window and door blocks are mounted, interior and finishing works, and engineering communications are carried out.

The formwork system is made in the form of a flexible shell made of high-strength rubberized fabric with a thickness of 0.3 ... 0.5 mm, filled with compressed air. In the working position, the formwork is obtained due to excessive air pressure. When working with a pneumatic form, it is necessary to constantly maintain a working pressure of about 1.2 kPa.

The air supply unit should operate in automatic mode, the pressure inside the formwork should be constantly monitored with pressure gauges. For the passage of workers under the shell of the formwork entrance gateway with two tight-closing doors is arranged.

Before concreting, its surface is coated with emulsion grease. The reinforcement is made of dispersed reinforced fiberglass or from a meshwork. Concrete is applied by spraying. When concrete acquires the design strength, the formwork is separated from concrete.

Concrete mix is put with the pneumatic concrete installation, beginning from the bottom from the base up, to the lock, on zones and on full constructive height. Workers are on a hydraulic lift, the thickness of the spray layer is controlled by pre-installation on the formwork of special landmarks, showing the thickness of the structure.

When the concrete reaches the design strength, it is removed. Initially, the internal pressure in the system and the formwork is removed, then the fixing devices are removed.

The demoulding of structures and the subsequent maintenance of concrete are allowed when concrete reaches 70% of the design strength. In order to speed up the process of hardening of concrete, steam or heated air is applied to the formwork. [1, p.20]

The Russian Federation has been increasing its presence in the Far North, and in its military doctrine it considers the development of a rich mineral region - the Arctic to be a priority. Currently, there is no one doubts in the need to build up a military presence there, politicians of different levels openly speak about it. Thus, opening the Arctic drifting station, Dmitry Rogozin said that Russia "must come to the Arctic and make it its own," and in turn this is impossible without the creation of large permanent military bases.

The arctic bases under construction and currently being designed are built on a modular basis from modern, lightweight and convenient materials. However, with all the advantages such constructions are good for scientific expeditions, and not as permanent strongholds of the Armed Forces of the Russian Federation.

Thus, the main useful areas are located above ground level, which undoubtedly facilitates the design, construction and operation, however, in the event of a military conflict, such a structure is extremely vulnerable to enemy fire. Moreover, the materials from which the modular structures are made do not provide protection even from small weapons.

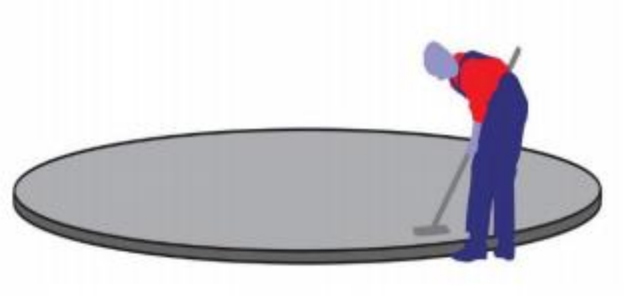
The question naturally arises about finding new technological solutions for building military bases in the conditions of the Far North. One of the solutions to the problem can serve as pre-fabricated domed reinforced concrete structures. These constructions meet all the basic requirements for the Arctic military bases:

1. These constructions are prefabricated (the term of construction depends on the specific size of the dome);
2. The main production processes (after inflation of the pneumatic formwork) are held inside the dome, which facilitates the construction work;
3. The air injected into the pneumatic wall performs the function of heating the concrete;
4. Dome structures are more durable with less material intensity;
5. There is practically no wind load on the dome structures;
6. The snow load decreases due to the deflation of snow and the absence of snow bags;
7. The dome structure is devoid of vertical supports, and can block large spans, which provides an increase in the usable area of the exploited space.

If we consider the dome structures (hemispheres) in terms of heat efficiency, then in a regular quadrangular building, the heating capacity (or insulation thickness) should be 30% larger than the building in the form of a hemisphere with an equal useful area.

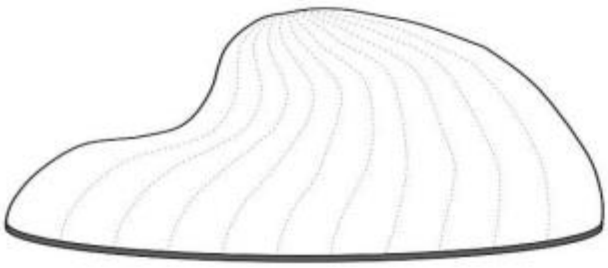
Accordingly, the operation of the building with the usual quadrangular shape leads to an increase in the cost of fuel and electricity by about 30% per year.
Dome shells show high reliability, durability and stability in conditions of extreme geological or climatic activity. Possessing high aerodynamic characteristics, shells are resistant to wind effects and perceive wind speeds that would be critical for other structures.
Dome-type structures can work excellently in areas of high seismicity, due to their relatively low weight, evenly distributed throughout the area, as well as high spatial rigidity.

These indicators cause the high resistance of such elements to earthquakes of up to 7-8 points on the Richter scale. The main advantage of dome structures is their low cost, due to the high manufacturability and low operating cost. The solidity of dome structures provides a high degree of localization of dust, thereby reducing the cost of environmental protection measures.
The technology of construction of pre-fabricated hemispheres is the construction of buildings using pneumatic formwork, lifting from the ground the entire structure, reinforcement, concrete in a liquid state.
The foundation for a dome structure is designed depending on the loads taken, as well as the purpose of the structure. The most common and convenient are: the foundation in the form of a ring slab or the foundation in the form of a round solid slab (see Pic. 1). In the case of the use of the foundation in the form of a solid plate, it also perceives the load from the stored material. In addition, a solid slab can be a pile grillage, forming the upper structure of the pile field.
During construction in the Far North, as well as for convenience and speeding up production, it is reasonable to carry out a foundation slab of precast concrete blocks assembled on site.



Picture 1. Base Plate

Along the edge of the foundation, it is necessary to leave the reinforcement for which the external thread is cut, to simplify the fixing of the pneumatic formwork.
However, when erecting small domes (the basis for long-term firing points, transition corridors, and so on), it is possible not to make releases from the foundation by fixing the pneumatic wall directly to the concrete with special screws with a bandage.
In conjunction with the side outlets in the foundation of the dome, mandatory vertical outlets of the working reinforcement are made for the direct fastening of the rods of the bearing reinforced concrete shell.



Picture 2. Pneumatic Formwork

A pneumatic formwork (see Pic. 2) is an awning made of special reinforced and resin-impregnated fabric, corresponding to the size and shape of the future structure. The pneumatic formwork has a rope sewn into the loop, which provides its fasteners to the foundation around the entire perimeter of the future structure. In addition, it should have a sleeve through which, after air injection, people will have access, as well as a hose for connecting a powerful air injection system and for maintaining an overpressure inside the dome during the entire construction period.

Everything necessary for construction work is laid on the base plate inside the dome, even before the pneumatic wall is filled with air.

The pneumatic formwork itself is placed in the center of the structure, unfolds over the entire area and is attached to the pre-set releases, along the entire perimeter of the foundation. Then atmospheric air is injected into the mold.

In order to avoid pressure drop and other unforeseen situations, the electric motor should be equipped with a dual drive system and automatic adjustment of the air supply. This will instantly switch work to power from a diesel generator. In addition, if these structures have to be erected in close contact with the immediate enemy and the form will be damaged, the system should automatically increase the air supply, which will prevent the loss of stability of the form.

As soon as the pneumatic formwork is filled with air and the internal pressure reaches the operating value, the air injection decreases.

After that, the pneumatic supply is connected to the technological passage left in advance, thanks to which it becomes possible for builders to enter the shell for further work. From this point on, all construction work is performed inside the shell, which negates the impact of climate impacts.

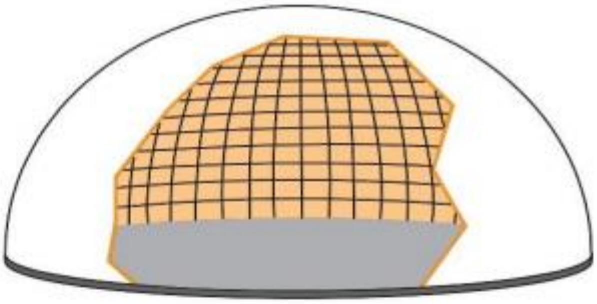
At the first stage of interior work, the first layer of a 2-component polyurethane mixture is applied on the inner surface of the pneumatic formwork (Picture 3). At the same time, the mixture itself (its components) is fed to the inside of the dome through hoses using a pump.

Picture 3 - Thermal Insulation

After hardening of the first layer of polyurethane, clamps are installed (on the surface of the foam over the entire area), to which the working reinforcement will be attached later. Then a second layer of insulation is applied, strengthening the fixing brackets. The heat-insulating polyurethane foam layer is: a reinforcing layer, due to which the form acquires comparative rigidity; it is used to install the working reinforcement during reinforcement and subsequent shotcreting.

The total thickness of the polyurethane foam layer depends on the terrain conditions and the purpose of the construction object. It can vary from 5 to 20 centimeters.

After the polyurethane foam is cured, the first-level reinforcement is installed by fastening the rods to the retainers of the polyurethane layer (Picture 4).

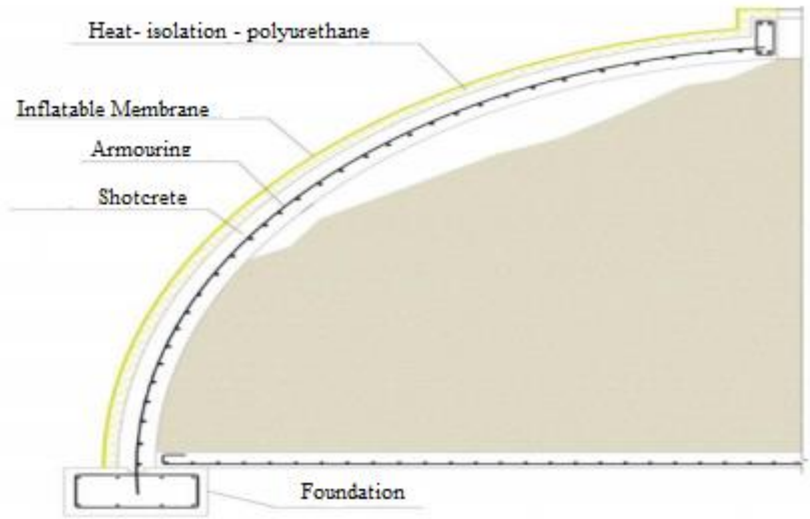


Picture 4. Armature frame

After installing the reinforcement of the installation layer, the working reinforcement is fastened and a solid spatial framework is created. To facilitate the entire structure while maintaining the quality characteristics of the structure, fiberglass, instead of steel, should be used as the working reinforcement.
Reinforcement is made from the bottom up in such a way as to transfer most of the load directly to the foundation, reducing the impact on the pneumatic wall and the insulation layer. Then, the frame is molded by spraying the concrete mixture (shotcreting method) (see Pic. 5)
The splash of concrete is produced by grippers in the direction of the bottom-up, from the "basket" placed on the boom of the crane or loader. The concrete thus applied, after setting, together with the reinforcement, forms a high-strength framework of the structure, capable of receiving the calculated loads with a large margin of safety and stability.

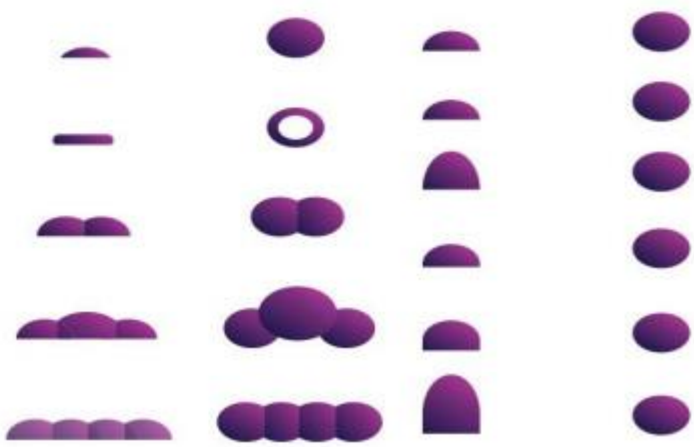
Picture 5 – shotcreting

If hemispheres, besides their own weight, must take increased external loads, additional reinforcement should be provided. When concrete takes about 75-80% of the design strength, the air supply stops, the inflator can be turned off and the main opening is opened for the removal (removal) of the construction equipment of unused materials.
After the termination of the application of the concrete mixture, the necessary apertures are cut out, their filling is carried out - the concrete dome is ready (Picture 6).
Pneumatic formwork plays the role of permanent formwork and performs the function of the top layer of the coating. Based on this, the color and quality of the reinforced polyester vinyl fabric should be chosen, taking into account the requirements for masking and architectural design of the structures.



Picture 6. - Dome in section

Thus, we get a solid reinforced concrete structure, suitable for use in northern latitudes, as well as providing reliable protection during military operations. The database for a closed system of vital activity, in which all processes are performed, does not leave the premises.



Picture 7. - Possible forms of dome structures

The main advantage of dome houses is high mobility and at the same time sufficient reliability to build such houses even in rather harsh climate. In the process of building spherical houses, as a rule, light, environmentally friendly and durable materials are preferable. In addition, they should be easily mounted and at the same time fully fulfill their role. The reviews about the domed houses are mostly positive.
Owners like the original shape, comfort and spaciousness of these buildings. Energy savings, low costs for the construction of spherical buildings are also often mentioned in the comments of their owners.
Projects of dome houses is an original idea worthy of attention. At an affordable cost, this design is very easy to build, resistant to any external factors and in no way inferior to the houses of the traditional form.

Abstract

Currently, most people are in a different search: in the search for information, materials or resources. The main criteria for finding a specific query are a cost-effective offer, environmental safety in use and maximum saving of personal time. A global environmental catastrophe hangs over the modern world. To prevent it, it is necessary to apply measures.

This article discusses the main types of foundations, as well as innovations in this area.

Key words: reinforced concrete foundation; isolated foundation; strip foundation; solid foundation; self-healing elastic concrete.

Introduction

The foundation is a structure buried in the ground that transfers loads and impacts from a building to the basement [1]. In the construction as a basis, it began to be used in the ancient times. Simultaneously with the development of the foundation, there was a process of development of the construction itself. Structures built on a good basis, have great durability, for example, the pyramid of Cheops has survived until our time. Its age is about 4.5 thousand years; weight is about 6 million tons, and the average load on the base is 12 kg / cm2.

The first mentions, recommendations for the construction of foundations appeared in Rome. Roman architect and mechanic Vitruvius (I century BC) is known for his treatise "On Architecture" (De archiectura), which is very valuable for the history of science, engineering and architecture. As well as recommendations for the construction of foundations found in the ancient annals of our country. But these are only references and recommendations, at that time there was no theoretical basis for calculating the basement and foundations.

Only in the XVIII century, the first theoretical development of science in foundation engineering appeared. In 1773, the French scientist Charles Augustin Coulon presented his work "On the application of the maximum and minimum rules to some maximum rules to certain statistical issues related to architecture" to the French Academy of Sciences. There the theory of calculating the resistance of soils to shear and the formula for calculating the pressure of the soil on the retaining wall were derived. Later also the French scientist Jacques Triget in 1841 proposed one of the methods for the construction of caisson foundations.

And in the XIX century such material as concrete was discovered which serves as the main link in the construction of foundations. And in 1899, our scientist Anton Emilievich Straus suggested using the stuffed piles, he also proposed to lower the armature into the wells and then fill it with concrete. Thus, the Straus first introduced reinforced concrete piles, and another Russian scientist, Alexander N. Lentovsky, used reinforced concrete to construct reinforced concrete caissons. All foundations are divided into three types: isolated, tape and solid.

Isolated prefabricated foundation

The most common among all types of foundations are isolated foundations. This is due to the fact that they are simple in construction and economical. It is recommended to perform this type of foundation symmetrically with respect to the plane of action of moments, which is the axis of the column.

Thus, they have a square plan on central loading, and in cramped conditions and on off-center loading, a rectangular shape is allowed, but with an aspect ratio of not more than 3: 1. They are arranged under each

column, regardless of its type (built-up column or monolithic), provided they are rarely located and there is a relatively small load on them.
There are two types of isolated foundations: prefabricated and monolithic. In turn, prefabricated foundations are divided into solid and composite. They are classified by the size of the columns. Solid prefabricated basket-type foundations are small, they are usually performed with one step with bevels on the surface of the steps of heavy concrete, starting with class B15 and ending with B25.
Despite the fact that this type of foundations is small, they have a rather large mass. For this reason, various designs of ribbed foundations were created, but due to the complexity of their manufacture they did not find wide application in production. In order for the foundations not to "move" on the ground, a sand-gravel compacted cushion 100 mm thick is made.

With such base preparation, it is allowed to use a protective layer thickness of 35 mm, while without this preparation it is necessary to use at least 70 mm. When reinforcing the diameter of the rods must be taken not less than 10 mm, and their pitch is in the range from 100 to 200 mm inclusively. When connecting the prefabricated columns and the foundation, they use the method of embedding the columns in special sockets.
The embedding depth of a rectangular section is assumed to be not less than the larger cross-sectional size of the column, and for two-bay, half the cross-sectional size of the larger side of the entire column and at least one-and-a-half size of the larger side of the cross section of the column branch is allowed.
The nest is made in the form of a trapezoidal parallelepiped. In this case, the wide part is located on the surface of the glass, and the narrow part is at a distance of at least 200 mm from the base. Between the sides of the column and glass, the foundation is arranged in such a way that it is at least 50 mm in the lower part and 75 in the upper part.

After the installation of the column in the nest is made, the gaps must be filled with concrete of a class not less than B12,5 on the fine aggregate to prevent the appearance of voids.
These conditions help to create a more reliable design through its rigidity. If at the preliminary calculations of loads on the ground large sizes of the foundation cushion are obtained, then prefabricated foundations are used.
Usually they are made of several blocks, it is more expedient from two parts - a shoe and a plate. Compared with the previous one, this type of foundation consumes significantly more materials.
The mass of prefabricated elements can reach tens of tons. At significant moments and horizontal thrusts blocks are interconnected by means of welded outlets, anchors, as well as embedded parts.

Isolated monolithic foundations

Monolithic isolated foundations are arranged both for prefabricated and monolithic frames of buildings and structures. In most cases, this type of foundation is performed directly on the construction site. To do this, at the bottom of the pit, it is necessary to mark the axes of future columns in a place that has been prepared and equipped in advance. Next, they install the formwork or assemble a removable formwork design, which greatly simplifies the work, because it does not require additional checks for correct installation.
After the installation for the lower tiers has been held and, accordingly, the check, they proceed the installation of the socket (sub-column). With a complex form of the column, the foundation is additionally reinforced with a metal mesh or welded reinforcement framework.

To simplify the work of designers and builders, standard designs are designed for standardized dimensions, which are 300 mm taps with a sole area from 1.5 × 1.5 to 6.0 × 5.4 m, height 1.5; 1.8; 2.4; 3.0; 3.6; and 4.2 m of monolithic foundations consist of an elongated sub-column, which is reinforced with a spatial frame, a base plate, where the overhang size refers to thickness as 1: 2, it is also reinforced, but with a double welded mesh.

Monolithic foundations are divided by form into two types: pyramidal and stepped. The height of the foundation must be taken in such a way that it is not required to be reinforced with clamps and bends. All pressure on the base of the foundation is distributed along the pyramid, the angles of which are equal to 45 °. This is what should be guided by when choosing the size of the steps.

Various columns can also be installed on the monolithic foundation. In order to rigidly connect the foundation and the column, from the basement they release the fittings calculated for the column at the edge of the foundation. The length of the release must be chosen in accordance with existing requirements.
Joints are installed only above the level and they distinguish several types of them. The reinforcement can be connected to overlap without welding, connected to the outlet in one place for columns centrally and eccentrically compressed at low eccentricities. If the column is eccentrically compressed with greater eccentricity (not less than two levels on each side of the column) and the section there are three rods, first the middle one is connected.
For ease of installation and welding in the connection fittings arc welding is used.
Currently, the use of pile foundations, which also belong to the type of monolithic reinforced concrete isolated foundation, is widespread. All piles of the building (structure) are united by a grillage, which is represented by a rigid slab. This is done in order to transfer the pressure from the pores to the piles. The forces directed from the center of the support are transmitted directly to the pile, but in flight, other forces that act on the compressed zone of the grillage must balance them, and thus all pressure will be transferred to the piles.
In this regard, we adopted the following reinforcement scheme: reinforcing belts are placed in the lower part of the grillage, which hold back the spread of the force F1; the clamps surrounding them take the F2 forces and are anchored in the concrete of the compressed zone, the reinforced spans are placed in the center of the lower part of the grillage.
Thanks to separate foundations, people have the opportunity to get in a short time a solid construction of their home, place of work or leisure.

Strip foundations

Strip foundations are foundations that are most common in construction. This foundation is a reinforced concrete strip, which is arranged under the rows of columns or under load-bearing walls. Under the load-bearing walls, strip foundations are most often assembled.
They are used at high loads from overlying structures or with weak soils. This design is created from prefabricated foundation blocks that transfer loads from the building to foundation pads, which in turn transfer the load to the foundation. Foundation blocks and foundation cushions are made in specialized reinforced concrete plants. In some cases, lightweight foundation cushions are used. Their distinctive feature is cut corners. Such cushions are applied to save 10% of the material used in their manufacture.
If the load on the base is insignificant, then foundation blocks can be used as a support part. For brick or block walls, wall foundation blocks are used. They are made with only two types of heights: 0.3 and 0.6 m.
Before the installation of prefabricated strip foundations, sand preparing is performed. Its thickness ranges from 10 to 20 cm. After this, foundation cushions are laid, between which a gap of 20 mm is left. It is not always possible to perform the tape without gaps between the prefabricated elements.
In such cases, monolithic reinforced concrete inserts are used, the height and dimensions of the cross section of which are similar to the adjacent precast elements.

On top of the foundation slabs, the foundation blocks on the cement-sand mortar are laid down. The width of the blocks is chosen according to the width of the walls of the building or structure, while it is allowed to carry out the overhangs of the elevated walls up to 13 cm. The number of rows of blocks in height is determined depending on the depth of the foundation. When laying the foundation blocks, they are ligated along the wall and at the junction of the longitudinal and transverse walls.
To provide dressings, monolithic concrete inserts and additional blocks are used. The seams between the foundation blocks must be reinforced with reinforcement. A reinforced concrete belt 15–20 cm thick should be arranged over the last row of blocks.

Under the rows of columns, tape foundations are arranged in the form of cross-strips of the longitudinal or transverse direction. They can be performed as prefabricated foundation or monolithic one. In most cases, the foundations of T-section with a flange to the bottom are used. There are cases when foundations with the same cross section are used, but with a flange on top, for example, in soils of high connectivity. The flanges are assigned such thickness that it does not require reinforcing them with bends and transverse rods.

If the overhang of the flange is of great length, then its section is made with a thickening towards the rib. The reinforcement of the ribs is performed in the same way as the reinforcement of multi-span beams. The longitudinal working reinforcement is determined by the calculation of the normal section for the effect of bending moments, and the transverse rods and bends- by the calculation of the inclined sections for the action of transverse forces.

When constructing foundations, it is very important to take into account the possibility of uneven loading of the foundation during the construction of the structure. Therefore, in the ribs a continuous longitudinal upper and lower reinforcement is established.

Tapes are reinforced with welded or knitted frames. Upper longitudinal bars are reinforced along their entire length with welded meshes in the horizontal direction. In the calculated cross section of the reinforcement of the tape include the longitudinal bars of the frames and grids. No more than 30% of the working rods can be distributed over the entire width of the flange.

When the flanges are reinforced with welded and knitted nets, the wide welded meshes should be laid in such a way that the longitudinal bars serve as the reinforcement of the tapes, and the transverse ones - the reinforcement of the flange. When reinforcing the narrow mesh is laid in 2 rows. According to the rules of joining welded meshes, all meshes are laid without an overlap, with the exception of the upper, longitudinally joined overlap without welding.

If the flange overhangs are large, up to 750 mm, half of the working reinforcement may not be brought to the outer edge by the distance calculated by a special formula.

Continuous foundations along with pile foundations are deservedly considered the most versatile, since they can be used both for lightweight structures and for loaded ones, evenly distributing pressure over the entire perimeter of the base. Despite the simplicity of the design, it is quite durable.

Solid foundations

In contrast to continuous foundations, solid ones are very uneconomical in terms of the consumption of building materials and, accordingly, cost. Solid foundations are made of reinforced concrete or girder less slabs to the entire area of buildings and structures. They are used at significant loads, as well as when there is a need for a device to protect the basement from the penetration of groundwater.

Slab-beamless, slab-beam and box-shaped foundations are distinguished. The choice of the type and size of a solid foundation directly depends on the resultant of the main loads of a building or structure. It is very important that this load passes through the center of the sole.

The base plate without a beam is reinforced with welded meshes with working reinforcement in one direction, which is joined by an overlap without welding.

The reinforcement of the non-working direction is connected without an overlap. The grids are stacked on each other in not more than four rows. In ribbed base plates, the reinforcement occurs similarly to the reinforcement of the ribbed slab, that is, with welded meshes and frameworks.

Double longitudinal and transverse meshes are placed in the body of the slab, the maximum stress zone of which is additionally reinforced with a double transverse mesh. The armature, grouped into grids of three working rods, is applied at local bends and is installed above the grids so that gaps remain that provide access to the lower reinforcement.

In the fins of the slab space frames are placed, which are made of flat frames and transverse rods. They are joined by welding. The frames in the ribs are connected to the reinforcement of the plate with pins.

Foundations perceive static and dynamic loads. Impacts from various machines and mechanisms can be attributed to dynamic loads. Depending on the type of main movement, all machines and mechanisms are divided into two groups – batch type and acyclic (table).

Table 1 - Classification of machines with dynamic loads

The group of machines	Type of the main motion	Sample
Batch-type	Equable rotation and related	electrical machinery, electric motors,

machine	translatory motion; reciprocating motion culminating in periodic strikes	generators, machines with a crank mechanism, compressors, pumps, internal combustion engines, sawmills, shaking and shock-vibration molding machines, used in foundry and precast concrete industry, automatic stamps
Acyclic machine	Uneven rotation or reciprocating motion; reciprocating motion with individual strikes; motions causing mass displacement of the processed material, transferring random loads to the foundation	drive motors of rolling mills, discontinuous power generators, forging and stamping hammers, impact machine, mill installations

For proper operation and normal operation of machines and mechanisms, the foundations must have a convenient location, in order to secure the mechanism, they must be strong and resistant to various types of loads. Foundations for machines are made of concrete or reinforced concrete. According to the method of construction, they can be arranged in monolithic, prefabricated and monolithic, and prefabricated. For monolithic and prefabricated monolithic foundations, concrete of a class not lower than B12.5 is used, and for prefabricated ones it is B15.

According to design features, foundations can be divided into massive, wall, frame and lightweight. The reinforcement of such foundations is carried out in accordance with the requirements of the construction rules 2.03.01–84 "Concrete and reinforced concrete structures" and the construction rules 2. – 2.05–87 "Foundations of machines with dynamic loads".

It is permissible to build foundations for vehicles with dynamic loads on bulk soils, but provided that they do not contain trash and various kinds of impurities, otherwise the foundation may drawdown. If at the base of the foundation there is a weak ground, for example, peat lands or over moistened clay, lying at a depth of 1–1.5 m, then it is replaced with a well-compacted sand cushion.

Innovative materials

The 21st century is the age of high technology. Thus, at the present time in the USA, self-healing elastic concrete was invented; concrete from carbon dioxide was introduced by Canadians. The idea for self-healing elastic concrete was given to scientists from the University of Michigan, Victor Li and Yingzi Yang by ordinary shells. A complex of minerals that affects shell growth has been added to concrete. The effect surprised even the scientists themselves. When applying the load on the plate of concrete, it bends, but does not break, becoming covered with a grid of small cracks.

After the load is removed, the concrete restores its integrity. Water and air are necessary for this. Water reacts with compounds in concrete, and when reacting with CO2, calcium carbonate compounds are formed, which fill the cracks. "After self-healing, this piece of concrete will have almost the same strength as before damage," the inventors commented. This type of concrete has already been used in the construction of one of the bridges in Michigan.

During the construction of the overpass, compensating temperature fluctuations were not used, due to which cars pass over the bridge silently. Similar concrete has already been used in the construction of a sixty--storied building in Osaka.

Scientists hope that their invention will be in demand despite the cost is three times more expensive than the type material. This technology allows building houses in earthquake-prone areas of the globe, since such concrete is 40–50% lighter than usual concrete [2].

With the development of technology, there is an increase in harmful emissions into the atmosphere of the Earth, which leads to the formation of holes. Along with this, there is an active deforestation on the planet, forming new plantings, but they are ineffective, because the rate of cutting down trees is higher than the growth rate of one tree. A single newly planted tree cannot replace an adult healthy tree.

Canadian company Carbon Cure Technologies has created concrete that can reduce emissions. For their production requires carbon dioxide emitted from factories such as refineries or for the production of fertilizers. One hundred thousand blocks can absorb as much carbon dioxide as ninety-two trees in one year. This recycling of garbage gas will reduce the greenhouse effect, reduce the cost of concrete, while it will become even stronger and environmentally safer [3].

New is well forgotten old. Even in ancient Rome, houses were built from ordinary earth soil. Today, the Priory Palace in Gatchina, built by the architect Nikolai Aleksandrovich Lvov in 1799, can be considered the most famous rammed-earth construction. This is the only building in Russia built of compressed loam impregnated with lime mortar. Now it is used for the construction of support structures and walls.

Rammed earth has high moisture resistance and practically does not shrink. To improve the thermal performance, you can use the most environmentally safe material additive - straw. It must be cut and added to the mixture. After a few years, this composition is gaining strength comparable to the strength of concrete [4].

Each person has a question about where to start, no matter what concerns the question: living or building a house of dream. The choice of the foundation must be considered very seriously, so that it can ensure maximum reliability of the structure and be completed as soon as possible. To do this, first, you need to decide on the type of construction, then carry out engineering surveys and determine the type of foundation soil, it is important to take into account the cost of building the foundation.

The most expensive foundations are solid. Their cost for the size of 6 × 6 m with double reinforcement and a plate height of 250 mm on average costs 136 thousand rubles. Under these conditions, about 20 piles will have to be driven at an average cost of 56 thousand rubles. Pile, like tape, is very versatile - can be used in different soils, but the consumption of materials is 4 times more.

The cost of work increases significantly due to the fact that special pile-rigs are required for piling. It is necessary to treat isolated foundations with due attention, since these are rigid structures and, accordingly, reliable. But we must take into account the fact that when installing in winter conditions it will be necessary to attract additional funds for various additives or electric heating.

Without these elements, it is impossible to begin construction at this time of the year, since the declared strength of concrete will not be achieved. In turn, the individual precast foundations are easy to use, do not require a large amount of time during installation, and do not require aging after installation [5–7].

Abstract

The article describes the main innovative technologies of construction 3-D printing in modern construction. This research direction confirms the relevance of the selected problem.

Development of structures for 3D printing will allow the construction of not only individual building structures, but also buildings and structures as a whole. Experimental compositions are being developed that allow one to obtain a sufficiently dense concrete structure.

The roles of additive technologies in the construction of buildings during the construction of buildings and structures are shown.

Keywords: 3D printing, additive technologies, fine concrete, dry mortar.

Introduction

Modern construction is developing at a high speed due to the introduction of innovative technologies into its process, as well as modern materials [1]. The construction area can be called the most resource-intensive, since the construction of buildings and structures requires a large amount of non-renewable resources, the consumption of which increases with the increasing needs of people. These include the need for housing, the construction of industrial and public buildings [2]. In this connection, it is necessary to use various additive technologies that could solve such important problems as:

- energy consumption;
- resource consumption;
- low production efficiency
- increased safety at the construction site.

Many countries are facing these problems. Additive technologies are the process of stratifying or soldering individual parts or materials into a single whole, while the total construction costs are reduced to 60%, which leads to a decrease in the cost of finished products [3].

Pic. 1. Layering of building materials

In building 3D printers, the main part is the print “head” into which the solution is fed [5]. In some installations it is provided to prepare the mixture directly in the “head” itself. The advantages of layering can include such factors as:

- the possibility of changing the shape of the structure in the process of its manufacture,
- manufacture of structures of complex geometric shapes,
- low labor costs
- speed of construction (no need to install and disassemble the formwork for each structure),

- high quality,
- economical consumption of building materials.

Used printers may vary depending on the type of construction being constructed, the conditions of construction and on the type of building materials [6]. The most common types of 3D printers are: self-propelled (Fig. 2), with a telescopic device (Pic. 3) and portal.

Pic. 2. Mobile self-propelled tracked printer

Pic. 3. Printer with a telescopic device

Together with the use of 3D printers, modern building materials should be used, which will be distinguished by their cost effectiveness and low cost. The composition of the working mixture (Fig. 4) of the printer will depend on the operating conditions.

Pic. 4. Certified construction mixes for 3D printers

The most well-known additive technologies include the use of 3D technologies in the construction process, namely printers. The essence of this method consists in applying the construction mixture in layers to each other (Pic. 1), and in some cases creating a net structure, which becomes possible using fast-hardening mixtures and solutions [4].

The first who began to use 3D-printers for the construction of residential buildings were scientists from China. So, in 2014, using a WinSun printer, they were able to create ten 5-storeyed houses. "WinSun" - allows you to build buildings up to 6m in the shortest possible time.

Currently, additive technologies in construction are not widely used, this is due to several factors. These include the high cost of the equipment itself and its rent, as well as their small amount [8].

Another obstacle to the introduction of additive technologies is the lack of a regulatory framework for their use. In the future, scientists are planning to improve the production technology of 3D printers, which will reduce their market value and massively introduce them into the construction market. The use of innovative technologies will contribute to a significant reduction in the cost of construction [9].

To create an optimal building structure using additive technologies, the requirements for rigidity, strength, durability under various operating conditions should be taken into account at the first design stage. Therefore, the selection and study of raw materials is of paramount importance [10].

Today, 3-D printers can use different polymers, steel powders, alloys of such elements as titanium, nickel, aluminum, copper, ceramics, and so on [11-12]. But in the field of construction, additive technologies have not yet acquired large-scale use, since raw materials are under research and development.

It is worth noting that in order to build a building using a 3D construction printer. First of all, it is necessary to prepare the area, fill the foundation of the future building and level the surrounding area that the printer itself stands as even as possible. Only then can you install the printer.

The main difference between a 3D printer and any other industrial robot is the way of creating products. In particular, a construction 3D printer has a nozzle or an extruder and squeezes a fast-hardening working mixture out of it. The surface, on which the volumetric product is created, is called the working area and it has the dimensions given by the stroke of the nozzle. And the formwork is not required.

There are three ways to create a three-dimensional structure:

1. Layer-by-layer extrusion of a viscous working mixture. Most construction printers use this method. It lies in the fact that the 3D mechanism has an extruder or the nozzle from which a rapidly hardening concrete mix is squeezed out, which includes many different additives. Each layer is squeezed by the 3D printer over the previous one, due to which a certain structure is formed.
2. Sintering method. With this technology, in the working area of the 3D machine, the working mixture is melted, and melting is achieved, as applied to construction, with a concentrated laser or sunbeam, and the working mixture is ordinary sand.

3. Spraying method. In this method, a jet of sand comes out of the working nozzle, which is immediately mixed with an adhesive / catalyst, forming a volume at a programmed point.

Sintering and spraying methods are environmentally friendly as solar energy is used.

There are two types of designs:

- in the form of a bridge crane;
- in the form of a boom.

3D printing technologies have several advantages. They will be considered on the example of the comparison of construction using gas blocks and the introduction of 3D construction printer.

Table 1 - Comparisons of construction when using gas blocks and the introduction of 3D construction printer

Construction using gas blocks	Construction using 3D-printer
Production blocks at the factory	Concrete mix is ready for building constrcution
Delivery of blocks to the place Construction	Two people are needed to control the process of printing
Laying of blocks lasts for 1-2 months	Printing the walls of the building lasts for 2-3 days
Additional insulation	The building is ready for finishing
Construction waste on construction site	No construction waste
Additional materials and equipment	Minimum of handling operations

But, in spite of all this, there are still several factors of the widespread use of 3D printers in construction:

1. Concrete that requires vibration treatment cannot be used as a working mixture, since due to the inability to use the appropriate settings, the material strength is significantly reduced. A high setting and hardening speed of mix is required. It is impossible to infinitely enhance the action of an accelerator without the danger of deterioration. The solution may be the development of new / deep modification of the types of building materials. At the moment, such concrete mixtures are too expensive to produce.
2. There is no proven technology for the installation of valves; vertically mounted rods prevent the printer from moving freely over the layers at the correct height. The reinforcement technology can be applied innovative technology woven bulk-mesh frames. It is proposed to connect the reinforcement on the pins, screw it, etc. Perhaps the problem of reinforcement will be solved by using two robots at once: one mounts the reinforcement, the other lays the mixture.
3. The impossibility of vibration treatment. In the case of monolithic and block-panel construction, vibration treatment is used to remove air and air voids from concrete. Due to this, reinforced concrete has a very high strength. But in the case of 3D construction, due to the lack of formwork and the short-term placement of the supporting molding blades in contact with the concrete solution, vibration processing is practically impossible. As a result, the constructed building or structure according to this technology will stand for a long time.
4. Filling technology is carried out by waves, in which the air gap remains, which provides the necessary degree of house insulation. This method is suitable only for a temperate climate. In colder countries, a house created using this technology will require additional insulation.
5. And one of the most significant limitations is that the concrete, used in contour casting, hardens only at above zero temperatures, which negates the possibility of using such 3D printers in winter or in cold climates.
6. There is a restriction on the height of buildings. They should be not more than four floors. Due to the fact that the construction of the building uses a special lightweight reinforcement cage, which fits only in the process of pouring concrete. This greatly reduces the strength of the building.

The average print speed of a modern construction printer is 7-10 m2 / min, while in China, devices that can build houses at 50 m2 / min are already being actively used. In just a couple of hours, such installations can print a whole house up to 200 m2. Taking into account the finishing and laying of all necessary communications, construction takes from one month to six months.

The cost of building of a small, about 100 square meters, typical country house is only 2.5-3.5 thousand dollars.

The cost of such a house with doors, windows, roofing, communications, with external and internal decoration is about 8-10 thousand dollars. A similar structure of brick will cost at least twice as expensive. It is possible to sell a printed house with a full finish for 16-25 thousand dollars.

Such low construction costs are ensured by low prices for materials and their extremely accurate dosing, as well as high quality construction. So far, the house building industry using 3D printing is at the initial stage of its development, and few companies produce equipment. The cheapest way is to buy a printer made in China.

A little more expensive the products of the Russian company ZAO Spetsavia will cost, which is based in Yaroslavl. In terms of price and quality, they are the best on the market. The ubiquity of construction printing is only a matter of time. The technology makes it possible to build houses quickly and at minimal cost. This may be relevant in countries with a large population and lack of housing, for example, India, China. And also in the countries of the third world, where people are forced to live in barracks built of scrap materials. Rapid construction can be used in disaster areas - it will be possible to produce fast houses and temporary shelters in a matter of days.

And NASA plans to use this method of construction when building a base on the moon [6]. We look forward to further development of technology. In our opinion, the next step will be the use of robots, which do all the work without human intervention - build walls, reinforce them, build roofs, conduct communications, equip houses with stairs and windows, and make exterior and interior decoration of the rooms. Not far off, and the construction of multi-storey structures - seven floors and more.

Comprehensive development of concrete mixes will help to select not only compositions for specific conditions and tasks, but to use construction waste as a raw material. The use of mineral additives in concrete solutions will also help to maintain the ecology of the planet - reduced cement consumption will reduce carbon dioxide emissions into the atmosphere.

To summarize, we can say that this technology has great potential in development, but it requires significant improvements and additional financial investments. And while it justifies itself only in the stationary, industrial and mass production of complex concrete products suitable for the construction of prefabricated houses on the principle of the designer.

Abstract

The article is directed towards the solution of such an urgent problem of contemporary society as the improvement of the system of preventing juvenile delinquency. The content of the process of preventing juvenile delinquency has been disclosed in the article. This process is viewed as an integral part of the single educational process, designed to ensure the solution of common objectives of socialization and education of the younger generation with the maximum use of available funds of educational, cultural, public and state organizations. It has been proved that the prevention of juvenile delinquency should include: 1) cooperation of law enforcement agencies, cultural, educational, scientific centers, public and state institutions in the planning, organization and maintenance of preventive activities; 2) the development and use of adequate criteria to evaluate preventive activities together with designated institutions and organizations; 3) professional training programs for specialists who are able to provide social, psychological, pedagogical assistance to children with difficulties in social adaptation; 4) the organization of continuous information interaction between all institutions and subjects of prevention. In addition, In the article the author(s) also identifies the effective mechanisms for socialization and rehabilitation of minors who are prone to commission of crimes or have committed offenses and crimes.

Keywords: socialization, rehabilitation, deviant behavior, minors, psychological and pedagogical support and follow-up.

Introduction

The objective of the social formation of an individual is important for any state, especially for our multinational country during the period of the reorientation of values that have a significant influence on the formation of social experience in children and teenagers. The social significance of social institutions which create conditions for socialization significantly increases. Institutions that provide recreation and rehabilitation for minors occupy an important place among all these institutions.

Socialization in terms of institutions that provide recreation and rehabilitation of minors comprises two stages. The first stage is intended for adaptation to the conditions, to the role functions of an adult person, social norms, taking shape at various levels of the child's life in a recreational or thematic institution. The second stage of socialization is characterized by the process of transferring social norms and values into the inner world of a child. Being engaged in remedial work, the specialist takes account of the previous, formed experience of deviant behavior of the minor. Health care and recreation institutions that provide their services to minors, being in contact with the family, school, and state, to some extent, ensure the inclusion of children and teenagers in social life. The concept of developing a system for the prevention of child neglect and juvenile delinquency for the period up to 2020 emphasizes the importance of a child's attending recreation and recreation institutions as a part of the socialization process. It represents the purpose-oriented management of personal development based on the inclusion of children and teenagers in various types of social relations in communication, play and practical activities. Spending time in recreation and health care institutions a child can become aware of himself as a person, assert himself, take up his interests. In this connection, pedagogical activity in such institutions should be based on harmonization of social needs and interests of an individual, ensuring the priority of the interests of each individual and society (Efimova, Salakhova & Oschepkov, 2015; Masalimova et al., 2019; Salakhova et al., 2018a; Zmanovskaya, 2004).

Taking account of the specific character of institutions that provide recreation and health care services for minors, we can identify three main criteria of the effectiveness of socialization:

– a cognitive criterion characterizing the availability of knowledge about various types of social relations; knowledge of the features of social communication; awareness of the dependence of their success on the development of public relations.

– a motivational criterion characterizing the need for social communication in various groups; focus on achieving results in social activities; adequate assessment of their participation in activities.

– an activity criterion characterizing the inclusion in socially significant activities; being initiative and active in various types of activity; a creative approach to activities.

Thus, the attendance or stay of children and teenagers in the institutions of recreation and rehabilitation will ensure the implementation of the three criteria of socialization and will help eliminate the causes and conditions conducive to offenses and anti-social actions of minors (Mitin, 2016; Rean, Belinskaya & Narovsky, 2013; Kalenik et al., 2018; Salim, Wadey & Diss, 2016; Sevastyanova, 2004).

Sample and Techniques

In recent years in Russia, in practical work with children and teenagers, who have certain deviations in their behavior, there is a tendency to use the potential of recreational institutions to implement remedial activities by various specialists. The provision of reforming activities in the setting of recreation and health care institutions has its own characteristics in comparison with other institutions of education that implement this type of activity. The main feature is the focus of reformation work on the personality of a teenager himself and the changes that have occurred in him, due to the established experience of deviant behavior in the main living environment.

Solving the problem of reforming deviations in minors' behavior is an urgent task not only for parents and teachers, but also for state and municipal administrations and committees. An increase in the number of children's and teen clubs in Russia, as well as the growing cooperation of educational institutions with social and psychological centers, other health care centers and foundations has recently contributed to it. However, the system of interaction between such centers and educational institutions is not always sufficiently effective due to temporal limitations. Work with children is often conducted only during the school period and within the walls of the school. During the holidays, some of the children go to an institution of rest and recreation for minors, the rest remain either under the care of parents or at the mercy of the street. They solve the problem of arranging their own leisure by themselves, and substantial and interesting activities, exciting activities during the holidays are often missing. It is during the holiday period, according to law enforcement agencies, the number of offenses among children and teenagers rises. Therefore, to keep this category of children busy means not only to arrange interesting holidays, but also to carry out remedial work in order to form attitudes towards socially-approved patterns of behavior. The majority of the minor children who attend the institution of recreation and health care, have records in the police department for vagrancy, petty hooliganism, the tendency to arson, the use of psychoactive substances among children. Now more and more recreation and health care institutions for minors are springing up, which bear not only the function of providing rest, but also a reforming one. In this regard, the issue of planned and systematic arrangement of the activities of children and teenagers, in particular, in organizing rest and recuperation, becomes especially urgent (Rubinstein, 2000)

Recreation and health care institutions for minors are, on the one hand, a form of organizing children's free time, and on the other hand, supplementary education institutions whose tasks are to provide training and upbringing for minors. These institutions are a part of the social milieu in which children discover, realize their potential, gain experience of social interaction in isolation from the familiar family or school atmosphere. The goal is pursued by complementing and expanding the influence of the family and the school on the child: assisting in social, spiritual and moral well-being, healthy physical and mental development of the child. In view of the current nature of the development of our society, the leading objectives of education should be directed towards the development of the skill in children and teenagers to learn how to behave in a difficult situation, the development of self-regulation skills, communicative competence, skills of coping behavior (Masalimova & Chibakov, 2016).

Reforming work in the setting of providing recreation and health rehabilitation should represent a specialist's activity aimed at breaking child's attitudes, ideas, values, stereotypes and motives of deviant behavior and the formation of new ones.

Activities to reform and bring up should be directed towards the elimination of certain attitudes, ideas, values, motives, behavioral stereotypes and the formation of new ones in order to achieve self-realization of the individual in society that can be carried out with social and educational means. This elimination is manifested in a change in attitudes, in rethinking of values and meanings which results in the individual's reformed behavior in accordance with the norms adopted in the social environment, society as a whole. Owing to this activity, a breakdown of previously formed motives and attitudes to deviant behavior takes place.

The need for reforming activities arises in cases of social deviations in children and teenagers' behavior. The assistance rendered to the personality of a minor has here the character of reforming and educational activity. Its goal is to break the manifested elements of readiness for deviant behavior and to form a stable system of norms and values that correspond to the norms and values of society (Belicheva, 1994; Fortova & Eropov, 2016).

Reforming minors' deviant behavior in recreation and health care institutions should include a set of measures directed to changing the established forms of maladaptive behavior, activating personal resources that promote adaptation to environmental conditions and the formation of socially effective behavior strategies. Reforming deviant behavior of minors should provide: a system of educational influences of teachers aimed at improving the child's personality that was incorrectly formed, at changing the qualities, habits and traits that contradict the norms and requirements of society; overcoming internal contradictions, replenishing and reforming the mental development of minors; activation of positive behavior of children and teenagers by enhancing the educational process (Voiskunsky, 2010; Masalimova et al., 2014)

Reforming juvenile deviant behavior should include:

– the analysis of the positive and negative properties of a minor, the study of his needs, deviations in behavior;

– the study of the pedagogical situation among the people around of children and teenagers with the subsequent neutralization or elimination of harmful influences and strengthening the positive effects of the milieu;

– restructuring the negative stereotype;

– changing the habitual behavior of a minor by involving him in new activities.

The essence of reforming deviant behavior of minors in recreation and health care institutions is the normalization of the entire mental life of the child, the accelerated development of the entire positive personality fund. The improvement of character is achieved by all measures that make the behavior of a minor normal and reform him in a social position. Such measures may be social, pedagogical, neuropsychiatric, physical recovery, or they may represent a combination of them.

The main guidelines of psycho-correctional work with deviant minors are the following:

– reliance on individual and group psychotherapeutic work;

– an individual approach to learning and morale building activity, an improvement of educational effects and optimization of interaction.

When organizing reforming work with minors, it is necessary to consider a number of psychological and pedagogical recommendations:

The uniformity of requirements from adults when organizing reforming work with a minor;

The adequacy of the requirements for a minor - compliance with his capabilities, giving him the right to determine his own main interests in life;

Providing emotional comfort to a teenager;

Providing autonomy in such an individual and age form that a minor develops a sense of belonging, an understanding of the significance of his / her own place in life and social role, and in the final educational process led to a change in moral values, increased responsibility and self-confidence.

One cannot expect an immediate effect from psycho-correctional work. It often appears after a rather long period when significant changes have occurred in the minor's personality (Mendelevich, 2001).

Results and Discussion

Leisure time during holidays is a socio-pedagogical phenomenon, the effectiveness of which is due to a variety of possible forms of learning and educational activities, the intensity of communication between children and adults during this period. The most familiar form of recreation for children at the present stage are children's health camps of suburban, sanatorium-resort types, labor and recreation camps. Modern concepts of arranging recreation and health improvement for children and teenagers view children's recreation in recreation camps not as a special pedagogical system or methodology, but as an inseparable part of the whole life of a child, where spiritual-esthetic, rational-cognitive, ideological and moral principles are harmoniously combined, this is child's learning to live in the most direct, natural way. The camp creates favorable opportunities to attract all children to physical culture and sports, tourism, environmental work, to expand and deepen knowledge about the world, to develop children's creative abilities, and to organize socially useful work. Taking into account the wishes of children and parents, specialized groups, sessions, camps, as well as groups of different age groups, teams can be organized.

When organizing work with minors in a recreation and rehabilitation institution, it is necessary to consider the following:

1) the experience of independence. The atmosphere of children's living together gives them the opportunity to learn about their life experience in a peer group away from home, to develop behavioral skills in a team.

2) entertainment and recreation. Children gain valuable and useful leisure experience, which is remembered for a lifetime.

3) the experience of democracy. Children with different education in the camp are given the opportunity to live in a real democratic community.

4) children's amateur activities. Participation in camp programs should be related to the interests and needs of the child. Only in this case, children will take an active part in the planning and implementation of the ideas of the camp life.

5) friendship with adults. Relations with young leaders of groups - for most children, are a new kind of relationship with adults. A good leader is an adult friend who loves children, understands their individuality, helps them, makes suggestions, listens and guides.

6) individual maturation and development. The camp should give the child a chance to discover their potential, experience personal initiative and gain respect for their behavior.

7) the experience of health-saving. In the camp, children develop habits of a safe and healthy lifestyle, implement them in real life, and this happens not at the level of talks, but expressed in real actions.

8) development of new skills and interests, improvement of the previous ones. Various activities in the camp are highly appreciated by children afterwards.

9) development of spiritual life and values. In the camp, children are aware of many moral concepts, not so much through training, as in real life situations.

10) development of a sense of responsibility for their actions; the experience of independent decision making; the experience of respecting the rights of others; the experience of interpersonal relationships and adaptation in the team; environment conservation skills. The provision of educational work in a children's

camp should include a sound system of teachers' actions directed to streamlining the value choices of joint activities of its subjects. When organizing educational work, it is required to consider the following essential characteristics of the educational process, which are most significant when it is organized in a children's health improving camp.

Firstly, the educational process in a children's camp is not a direct impact on the child but reflects the levels of social interaction of various subjects: individual (specific people), group (micro-groups and micro-teams) and social institutions of education (school, family, friends, etc.). Some ties exist and are maintained directly, others indirectly.

Secondly, the content and nature of the interaction between groups and individuals in the educational process are due to social values, ideas about the norms of joint activity. The ideas embodied in the content of the educational process in a children's camp also determine the attitude of children and adults to the outside world, and ultimately, to themselves.

Thirdly, when organizing the process of morale building activity one should take into account the peculiarities of the temporary association of children (short duration of functioning, heterogeneity of the composition, relative autonomy of existence, the collective nature of life, the completed cycle of development).

In the content related side of children's life in health care institutions, the following aspects should be present:

Health improving - this is the optimal mode of their physical exercises, body hardening, balanced nutrition, the rational daily regimen.

Compensatory. In the system of provision of summer recreation for children and teenagers, the principle of succession and continuity of communication and upbringing is valid, contributing to the comprehensive development of the personality of children and teenagers, performing a compensatory function in relation to school and allowing children to relax, remove physical and mental overload, creating new conditions for enriching experience, application of new knowledge and skills, developing children's self-realization, initiative and amateur activities.

The areas of morale building work with children and teenagers in a children's camp: mental development as mastering the foundations of sciences, laying the foundations of the scientific worldview, experience of rational cognitive activity, development of children's intellectual culture and their creative potential.

The content side of the life of recreation and health care institutions for children is provided by the participants of the educational process: the children's team and the teaching staff. The key links in the system of morale building are minors with deviant behavior and a teacher of a health care institution.

The manifestation of the forms of deviant behavior in minors is a consequence of violations of the psychological atmosphere of society. This is connected with a range of reasons: moral principles are falling apart, the function of the school to bring up and foster is weakening, free time during the holidays is not controlled by parents, children's leisure activities are not well organized, various deviant manifestations in the behavior of minors are activated. It is impossible to solve all these problems within the school, so there is a need for non-formal education that is able to organize a child's free time with the opportunity to develop skills and interests. One of the types of non-formal education is a recreation and education camp. The main purpose of this camp should be organized recreation and the creation of an environment in which the child is given an opportunity for self-knowledge, self-development, self-awareness as a part of society and determining roles for himself. Thus, in the course of working with minors in recreation and health care institutions, the following measures should be carried out with each child: to form the need to be a "personality"; creating conditions for the involvement of children in development activities; to create conditions that allow children to be aware of new social roles; to create conditions to participate in the measures for protecting the environment; to help in searching for people of the similar opinion and attitude; assistance in developing self-organization; to arrange health improving recreation: morning exercises, swimming, sports games; to providing an opportunity to participate in competitions, to know the joy of success; to provide an opportunity to participate in games and events that give pleasure and good mood.

With proper organization of psychological and pedagogical activities, recreation and health care institutions provide a favorable atmosphere for self-education and self-knowledge of the minor's personality. When providing recreation and rehabilitation of minors, all the leading activities become available: sports, communication, educational, labor, esthetic, cognitive and artistic and creative ones. Thus, the educational system of recreation and rehabilitation should be an ordered set of components directed to identifying and developing positive personal qualities, maintaining physical fitness and a positive psychological state of children during their holidays.

Conclusions

Improving the activities for the purpose of attracting institutions that provide recreation and health care for children to prevent juvenile delinquency during the holidays remains an urgent problem today. To solve this problem, the prevention of juvenile delinquency should be considered today not as an isolated set of measures, but as an inseparable part of the single educational process, designed to ensure the solution of common objectives of socialization and education of the younger generation with the maximum use of available funds of educational, cultural, social and state organizations.

Prevention of juvenile delinquency should include:

1) cooperation of law enforcement agencies, cultural, educational, scientific centers, public and state institutions in the planning, organization and maintenance of preventive activities;

2) the development and use of adequate criteria to evaluate preventive activities with designated institutions and organizations;

3) professional training programs for specialists who are able to provide social, psychological, pedagogical assistance to children with difficulties in social adaptation;

4) the provision of continuous information interaction between all institutions and subjects of prevention.

Thus, when organizing various types of leisure activities for minors in various institutions, it is necessary to take into account a social recovery of children and teenagers, which will ensure socialization and rehabilitation of minors prone to commission of offenses and crimes or those who have already committed a crime.

***Municipal budget preschool educational institution Kindergarten № 277 urban environment city Ufa of the Republic of Bashkortostan*
****Bashkir State Medical University*

Abstract

Modernization of the educational system as it is defined in the Concept of a long-term socio-economic development of RF for the period to the year 2020 is a foundation for the economic growth and social development of society, a factor of the citizens well-being and country security. Modernization touches upon the structure, content and technologies of upbringing and education on all the levels of the educational system.

In the Federal Law "On Education in the Russian Federation" an essential role is assigned to the system of preschool education. On January 1, 2014 the Federal Standard of Preschool Education came into effect.

The relevance of the problem under study is determined by the fact that in light of the adopted national programme for modernization of preschool education the information and communication expertise of a teacher takes one of the lead places. The contemporary researchers specify the information expertise of a teacher among the baseline competences.

The need to study the given problematics is conditioned by discrepancy between the necessity to introduce information and communication technologies into the professional and educational activity of a teacher in a preschool educational organization and the low level of maturity of competences and motivation to master and introduce them.

The objective of the paper consists in substantiation of conditions for development of the information and communication expertise of a teacher in a preschool institution in light of modernization of the preschool educational system.

The lead approach to the research of the problem is a pedagogical experiment consisting of the summative, formative and controlled stages enabling to reveal the maturity level of the information and communication competences of a teacher and the level of motivation to introduce into proper professional and educational activity.

The authors have analyzed the problems of modernization and informatization of a preschool educational system on the modern stage, professional expertise of a teacher as a basis for establishing new quality of education, and information and communication technologies of a preschool educational organization. The research of introduction of information and communication technologies into the educational process of a preschool educational organization was conducted, and model of managing the process of development of the information and communication expertise of a modern teacher was proposed.

The academic novelty of the research is that there were revealed the organization-pedagogical and psychological conditions required for the efficient management of the process of development of the information and communication competences of a teacher in a preschool educational organization in light of modernization of the preschool educational system.

The materials of the paper can be useful for building the information and educational environment in a preschool educational organization, as well as for planning the activities of methodological departments of the preschool education management.

Keywords: modernization, preschool education,teacher, information and communication expertise, competences.

Introduction

The primary objective of the Russian educational policy is to ensure modern quality of education on the basis of retention of its fundamental nature and compliance with the urgent and long-range requirements of a person, society and state. The goal of the education modernization consists in creating a mechanism of sustainable development of the educational system.

The preschool age is the crucial period for the personality development of a child. To achieve the optimum level of development of each preschool age child that will allow him/her to be successful at school is one of the priority objectives of the preschool education development in the Russian Federation. It cannot be settled without a flexible multifunctional system of a preschool education securing the constitutional right of every citizen of the Russian Federation for the generally accessible and free preschool education [1].

The system of a preschool education is a social institute of prime importance and necessary condition for the normal social development. The logic of modern development of the Russian education assumes the focus on new goals and realias which determine the life of society [2].

On September 1, 2013 the Federal Law "On Education in the Russian Federation" came into effect [3] where an essential role is assigned to the system of preschool education. On January 1, 2014 the Federal Standard of Preschool Education came into effect [4].

Modernization of the education system as it is defined in the Concept of a long-term socio-economic development of RF for the period to the year 2020 is a foundation for the economic growth and social development of society, a factor of the citizens well-being and country security. Modernization touches upon the structure, content and technologies of upbringing and education on all the levels of the educational system [5].

The modern model of education focused on the education quality enhancement is presented in the Concept of a long-term socio-economic development of RF for the period to the year 2020. "The developing society requires modern equipment, moral and entrepreneurially-inclined people who can take responsible decisions in a situation of choice forecasting their potential consequences, are good at cooperation, and distinguished by mobility, dynamism and constructiveness.."

The primary objective of the educational policy in the sphere of preschool education is to ensure the guarantees of an accessible and quality preschool education providing equal starting conditions for the subsequent successful education of a child at school.

The accessibility at that is characterized by the possibility to choose the nursery school, and quality – by the possibilities and capabilities of a child to master programmes on the subsequent levels of education. In order to improve the quality of the educational service the following is required: participation of citizens in the development of preschool education (evaluation of the education quality, formation of the education content, investment in the preschool education); extension of organizational forms of preschool education; elaboration and introduction of a new system of labour remuneration of nursery teachers; introduction of a normative per capita financing in the system of preschool education.

Such key qualities for the present society as creativity and capability for the search of knowledge are already formed at the age of 3–6 years. Therefore the contemporary model of education assumes high technologies for development of imagination, literacy and other basic skills of children. The modern educational standards are based on transition from the attitudes of memorizing bulk information to mastering new types of activity – project-oriented, creative and research.

A variety of problems facing a modern teacher requires of him/her the knowledge of information technologies, ability to efficiently cooperate with other people, fully use personal resources, willingness to implement proper educational path securing successfulness and competitiveness [6].

Therefore training of specialists in the sphere of preschool education acquires special value. Currently not just a nursery teacher but research-teacher, psychologist-teacher and technologist-teacher is in demand.

The primary directions of modernization of a preschool education are as follows:

- full coverage of children aged above three by preschool education;
- change of the financing system of preschool institutions: transition from the municipal to the regional level;

- ensuring standartization of preschool education since the preschool education becomes a part of the general education, its first step;
- learner-centered education of preschoolers;
- renewal of resources of the educational environment;
- creation of new mechanisms for the education quality assessment;
- introduction of new forms of social partnership;
- informatization of the educational space (systematization, renewal of information resources, development and approval of technologies of the multimedia support of the educational process, elaboration of a system of a consulting methodological support in the sphere of modern communication technologies being mastered by teachers and application thereof in the educational practice of a preschool educational institution, creation of a bank of electronic educatory and developing cycles, programmes, didactic and methodological materials on the basis of introduction of information technologies into the activity of a preschool educational institution);
- provision with sports facilities and modern playgrounds, education and laboratory equipment and means of transportation;
- creation and running of proper web-sites for preschool institutions;
- creation of resource centres in regions, coordinating the development processes in a preschool educational institution to reveal and support gifted children at an early age, and their professional development;
- contentment of the population with the quality of preschool education;
- activation of the development of a preschool educational institution by means of joint work with parents and municipal community;
- improvement of professional training of teachers of preschool institutions; the reform of salary and elaboration of professional standard for the teachers occupied in preschool education is instrumental in it [7].

Under conditions of preschool education modernization the problem of health preservation and promotion becomes especially acute. The issues of the formation of healthy lifestyle by the rising generation are not discussed in the modern didactics any more, but are considered universally recognized. They are elevated to a state policy.

The Law "About the Education in Russian Federation" defines preschool education as a full-value and the first level of the general education system (chapter 2, p.10) and one of the objectives of nurseries is to preserve and promote the health of children (chapter 7, p. 64). Moreover, in the Federal National Requirements to the structure of the primary educational programme of preschool education, the educational sphere "Health" was detached for the first time as an independent sphere with the priority objective to shape initial notions about healthy lifestyle [3,4].

On the modern stage of development and modernization of the Russian education, the psycho-pedagogical studies raise the issue of the necessity to highlight the objective of healthcare of children and reduction of diseases through the development of motivation for healthy lifestyle, and creation of conditions in educational institutions for preservation and promotion of children' health [8].

The modern children were born and live in the information society where the information and educational environment is already actively formed and functions beginning from the first element of continuous education — preschool educational institutions. The key objective of the information and educational environment in a nursery is to generate the potential for the enriched development of a child's personality and prepare it to life in the information society. For this purpose taking into account the specific nature of the preschool childhood it is required to familiarize children with the elementary foundations of the information culture. It is important to develop their interest to the modern technologies, essential scientific discoveries, gradually enrich their notions in the area of information and communication technologies, develop knowledge and skills, generate the need to use the modern equipment and advanced technologies in various types of activity.

In modern information society the civilization development is based on the information processes where information and communication technologies are widely used. Introduction of the information and communication technologies into all spheres of human activity resulted in the occurrence and development of the global process of informatization.

In its turn the process provided an impetus for the development of the education informatization which is one of the key conditions for reforms and modernization of the system of domestic education since it is the educational sphere which trains and educates people who not only form a new information environment of society but have to live and work in this new environment themselves.

Russia just as many other countries of the global community pays more and more attention to the problem of education informatization which is considered as one of the most critical strategic problems of the civilization development.

The education informatization shall be understood to mean the purposeful activity to develop and introduce the information and communication technologies having the following directions:

- in the educational process to prepare a person to life and activity under the conditions of a modern information society; improve the quality of the general educational and professional development of specialists on the basis of a wide use of information and communication technologies;
- in the management of the education system to enhance efficiency and quality of the management processes;
- in the methodological and research-pedagogic activity to improve the quality of teachers' work; develop and introduce new educational technologies on the basis of use of information and communication technologies [9].

An essential direction in the development of educational organization in the sphere of information and communication technologies (ICT) is the development of expertise of teachers and heads of the educational organization. The process implies the creation of the information space inside the educational organization.

J. Raven defines the expertise as a special human ability required to perform a specific action in a specific subject area including narrowly-specialized knowledge, skills, ways of thinking, and readiness to bear responsibility for one's actions.

N.F. Efremova adhering to synergetic approach defines competences as "generalized and profound mature qualities of a person, the ability to use and apply the obtained knowledge and skills most flexibly;" "a set of knowledge and skills enabling a subject to adjust to changing conditions, the ability to act and survive in the given conditions" [10].

In the periodical press the problem of development and introduction of the information and communication technologies in preschool educational organizations has been discussed for already several years. The lead domestic and foreign scholars, specialists in the area of preschool education express their viewpoint "pro and con" of the information and communication technologies. In general, the scholars note the developing role of the computer-based play structure in a nursery in activity with children. It is emphasized that "the society informatization sets an objective for the nursery school teachers to become a guide for a child into the world of new technologies, and an instructor in the choice of computer games, and shape the foundations of the information culture of a child's personality" [11-15].

The information space shall be understood to mean a team of like-minded people willing, able and having certain conditions for the development and formation of the information model of the educational organization, use of information and communication technologies in the educational process and in management of the educational organization, and successfully developing the electronic cooperation and partnership with the virtual educational pedagogic associations, universities, Ministry, superior governing bodies and administration [16].

The information technology is a complex of methods, ways and means ensuring storage, processing, transfer and display of information, which are oriented at enhancement of efficiency and labour productivity. At the present stage the methods, ways and means are directly interconnected with a computer (computer technologies) [17, 18].

Communication technologies determine the methods, ways and means of human interaction with the external environment (the reverse process is also important). Computer takes its place in these communications. It provides comfortable, individual, diversified and highly intellectual interaction of the communication objects. While combining information and communication technologies, projecting them on the educational practice it should be noted that the primary objective of introduction thereof is human adaptation to life in the information society.

It is totally clear that the information and communication technologies become the key tool to be used by people not only in professional activity but in daily life as well [19, 20].

However, as of today there is no clear system to develop such expertise while methodological recommendations and textbooks available represent some sketchy data without distinct structure and logic. Such textbooks are hard to use and do not represent any possibility to develop the information and communication expertise by a teacher on such a level that is declared in the regulatory documents.

The contemporary researchers specify the information expertise of a teacher among the baseline competences [21-23]. In other words teachers with the help of information technologies should be able to search, analyze, select, process and transfer the required information on their own.

The information and communication expertise of a teacher shall be understood to mean "the ability and readiness to arrange one's professional pedagogic activity using the means of information and communication technologies; implement the information interaction between all participants of the educational process" [20, 24].

In the Occupational Standard of a Teacher (as of October 18, 2013, No. 544n) a group of requirements to a modern teacher in the area of competences associated with the information and communication technologies is specified [7].

According to the document a teacher of the preschool educational organization shall have the following information and communication competences:

- all-user information and communication expertise;
- general pedagogic information and communication expertise;
- subject-specific pedagogic information and communication competence (reflecting the professional information and communication expertise of the respective sphere of human activity);
- implementation of contemporary including interactive forms and methods of educational activity using them both on the lessons and in extracurricular activity;
- know the information and communication technologies required and sufficient for planning, implementation and assessment of the educational activity with infants and preschool children;
- have basic skills of working with text-processing programmes, spreadsheets, e-mail, browsers and multimedia facilities.

The objective of the paper consists in substantiation of conditions for the development of the information and communication expertise of a teacher in a preschool institution in light of modernization of the preschool educational system.

The academic novelty of the research is that there were revealed organization-pedagogical and psychological conditions required for the efficient management of the process of development of the information and communication competences of a teacher in a preschool educational organization in light of modernization of the preschool educational system [29].

Research hypothesis: on the stage of modernization of the preschool educational system, the management of the process of development of the information and communication competences of a teacher in a preschool educational organization will be efficient if:

- teachers have a mature motivational readiness to master the information and communication competences;
- diagnostic methods will be elaborated to determine the indicators of teachers' skill level in information and communication competences;
- a programme ensuring consistency of development of the information and communication competences of a teacher in a preschool educational organization will be developed;
- conditions were created for the practical introduction of information and communication technologies by teachers into the educational space of a preschool educational organization.

Determination and approbation of these conditions is instrumental in:

- development of the motivational and psychological readiness of a teacher in an educational organization for professional development in the area of information and communication technologies;

- creation of the optimum model for management of development of the information and communication expertise of a teacher;
- development of a special programme with due account for the initial level of competences; creation of a motivational system for teachers;
- technical equipment of work places;
- systemic nature of studies on certain subject-matter with the subsequent introduction of the knowledge obtained into practical activity;
- entering amendments in the system of methodological work;
- creation of the situation of success, demonstration of achievements.

Thus, the review of the available research and methodological literature and modern regulatory documents in the sphere of modernization of preschool education persuasively shows the necessity of introduction of the information and communication technologies into the educational process and professional activity of a teacher of a preschool educational organization [25-28]. Accordingly, the information and communication expertise of specialists working in a system of preschool education is moving to the foreground.

Materials and Methods

The research activity was conducted on the basis of a Municipal Budgetary Preschool Educational Institution Nursery No. 277 of the urban district of Ufa city in the Republic of Bashkortostan and Municipal Budgetary Preschool Educational Institution Nursery No. 326 of the urban district of Ufa city in the Republic of Bashkortostan from November 2014 to April 2017.

25 teachers from the Municipal Budgetary Preschool Educational Institution Nursery No. 277 of the urban district of Ufa city in the Republic of Bashkortostan (experimental group) and 25 teachers from the Municipal Budgetary Preschool Educational Institution Nursery No. 326 of the urban district of Ufa city in the Republic of Bashkortostan (control group) as well as heads of the above mentioned institutions took part in a multiple-stage research.

The lead approach to the research of the problem was a pedagogical experiment consisting of the summative, formative and controlled stages.

Objective of the summative stage: to reveal the level of maturity of the information and communication competences of teachers. The following research methods were used on this stage:

- analysis of the psycho-pedagogical, methodological, regulatory and professional literature;
- questionnaire survey of teachers;
- interviewing;
- practical tasks;
- mathematical methods of processing of the research results;
- analysis, synthesis and generalization of results.

The objective of the formative stage of the research was to check the efficiency of work on management of the process of development of the information and communication expertise of a teacher in a preschool educational organization. On this stage a programme for the development of the information and communication competences of a teacher of a preschool educational organization was developed.

The research technique included 2 parts.

1. Theoretical part: theoretical course, discussion, answers to the questions, testing;
2. Practical part: independent work on the task, homework.

The tasks are classified in terms of the maturity level of the initial competences and are arranged successively.

The studies were conducted once a week with the teachers of the experimental group according to the plan, with the sub-group of teachers who had the first level of maturity in competences.

All practical skills were reinforced in independent activity in addition to the organized lessons. Lessons lasted 60 minutes.

On completion of each subject matter the testing was conducted in a form of a written assignment or test questions.

Alongside with the programme development we performed a job to create the motivation system to master the information and communication technologies and introduce into activity.

The financial incentive was realized by the administration of the preschool educational organization in form of a personal allowance to the teachers actively mastering and using the information and communication technologies from the payroll budget and from the fund of the activity yielding extra income. The mechanisms of non-financial motivation were also used.

There was also developed a model to manage the development of the information and communication expertise of teachers.

The innovative project “Electronic Didactic Games as a Means for Development of an Intellectual Potential of a Preschooler” was developed with the purpose of further introduction of the information and communication technologies into educational activity of a nursery. The primary goal of the project is to create conditions for the development of intellectual abilities in the process of independent design of electronic didactic games. The trainees had a possibility to master skills in the programme for presentations Power Point.

The activities were conducted to create and equip the developing objective-spatial environment. Teachers had at their disposal multimedia equipment including projection device, display screen, speakers, laptop computer; interactive board with a set of programmes, and laptop computers for use while formalizing the required documents, individual work with children, monitoring etc.

In the course of research activity we elaborated practical recommendations for teachers on creation of the information educational space in a preschool educational organization.

Objective of the controlled experiment: to check the efficiency of the elaborated model for management of development of the information and communication expertise of teachers.

In order to determine the efficiency of the work conducted we used the same diagnostic material as on the summative stage of the research activity.

On completion of studies teachers were offered to answer the questions of the same questionnaire as on the summative stage of the research activity.

Afterwards, the questionnaires of teachers were analyzed, and based on the answers conclusions were made about the level of maturity of the information and communication expertise of teachers on the controlled stage of the research activity.

Thus, we used the following complex of research methods: analysis of the psycho-pedagogical, methodological and professional literature on the problem under research, study of the pedagogical experience, analysis, synthesis, generalization, pedagogical observation, pedagogical experiment, sociological survey, conversation, interviewing and questionnaire survey of nursery teachers.

Within the frameworks of the research the questionnaire consisting of four sections was elaborated.

1 section. Knowledge of the basics of work with computer.

2 section. Ability to use office technologies to prepare various didactic and methodological materials.

3 section. Knowledge of the basics of work with the Internet.

3 section. Work with the information resources.

4 section. Motivational readiness.

The teachers were offered to specify the competences they have using the following answers:

- know;
- apply in practice on a regular basis;
- do not know, but willing to learn;
- do not know, not willing to learn;
- learn by myself.

The obtained research results enabled to analyze and make conclusions about the level of maturity of the information and communication expertise of teachers.

The reliability and accuracy of results was ensured by a sufficient amount of initial data, examples and calculations. While building a model of sampled population the method of quota sample was used. Among the quoted attributes the following were distinguished: age, level of the information and communication expertise, motivation to master and introduce the information and communication technologies in the professional and educational activity.

The respondents in experimental and control groups were divided into 2 groups: group 1 – teachers at the age of 20 – 40 and group 2 – teachers at the age of 40 and above.

Among those who participated in the research the fullness of quoted attributes in the experimental group was: 36% of teachers at the age of 20 – 40 and 64% of teachers at the age of 40 and above.

Among those who participated in the research the fullness of quoted attributes in the control group was: 40% of teachers at the age of 20 – 40 and 60% of teachers at the age of 40 and above.

Results

As a result of the research conducted there were determined three levels of maturity of the information and communication expertise of teachers of a preschool educational organization.

1. The basic level of maturity of the information and communication expertise including:

- knowledge of the computer operation basics (operation basics with the operating system, creation of simple documents by means of the text processing programme, creation of simple presentations);
- knowledge of the Internet operation basics (e-mail, information search);
- knowledge of the information systems capabilities;
- ability to create simple didactic and methodological materials using office technologies;
- knowledge of basic principles of introduction of digital educational resources into the education process;
- positive motivation to obtain knowledge in the sphere of information and communication technologies.

2. General level of maturity of the information and communication expertise:

- ability to efficiently search information in different sources, including the global Internet, electronic editions;
- critical view of the information found; selection of the information that can be trusted;
- ability to select the methods of the information representation with due account for the capabilities of the hardware and software;
- ability to install and remove applications and electronic educational resources;
- ability to use office technologies to prepare various didactic and methodological materials;
- ability to create and edit texts containing graphic elements, tables, schemes and formulas; to prepare various document templates in the word processor for the academic process;
- ability to create computation tables using formulas and built-in functions, construct graphs and diagrams in a spreadsheet;
- ability to create educationally efficient presentations (for the educational activity, speeches on a teachers' council and teacher-parent meeting, for presentation of proper educational experience etc.).
- knowledge of the methods of creation of proper Internet-resources for academic purposes;
- active participation in networking cooperation with parents and colleagues;
- knowledge of methods of using the ICT in the project and research activity;
- sustainable interest to ICT use in the educational process;
- aspiration to obtain the required knowledge in the sphere of ICT independently.

3. Professional level of maturity of the information and communication expertise.

- ability to arrange an efficient personal information space and information space of pupils within the frameworks of the information space of the educational institution;
- ability to create proper information resources for academic purposes using various software tools;
- knowledge of methods to generalize the experience of efficient use of ICT in the educational activity;
- ability to arrange an efficient information interaction in the global network with all participants of the educational process.

The analysis of results of the summative stage of research showed the lack of maturity of the required competences among 64.0% of teachers in the experimental group and among 35.0% of teachers in the control group. On this stage of research, teachers with professional level were not revealed in any of the presented groups. It is worth mentioning also that the low level of motivation to master and introduce the information and communication technologies is particularly noted among teachers with immature zero level of competences.

On the controlled stage of research the data was obtained testifying that 65.0% of teachers from the experimental group had a basic level of the information and communication expertise; 25.0% of teachers had a general level of the information and communication expertise and 10.0% of teachers had a professional level of the information and communication expertise (Fig. 1).

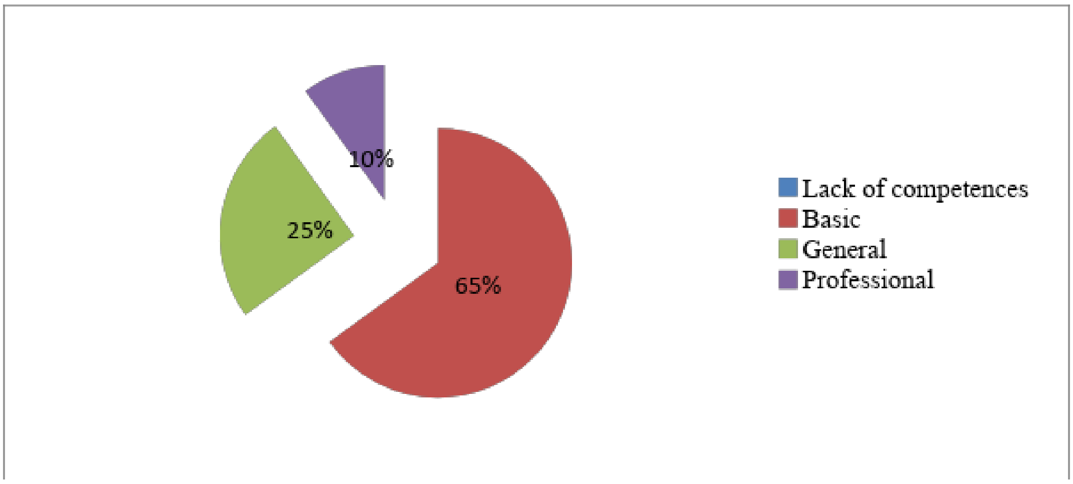

Fig. 1. The results of study of the maturity levels of the information and communication expertise among teachers from the experimental group

Fig. 2 shows comparative results of the levels of maturity of the information and communication competences of teachers from the experimental group on the summative and controlled stages of research testifying that the indicators of the basic, general and professional levels of the information and communication expertise of teachers grew significantly.

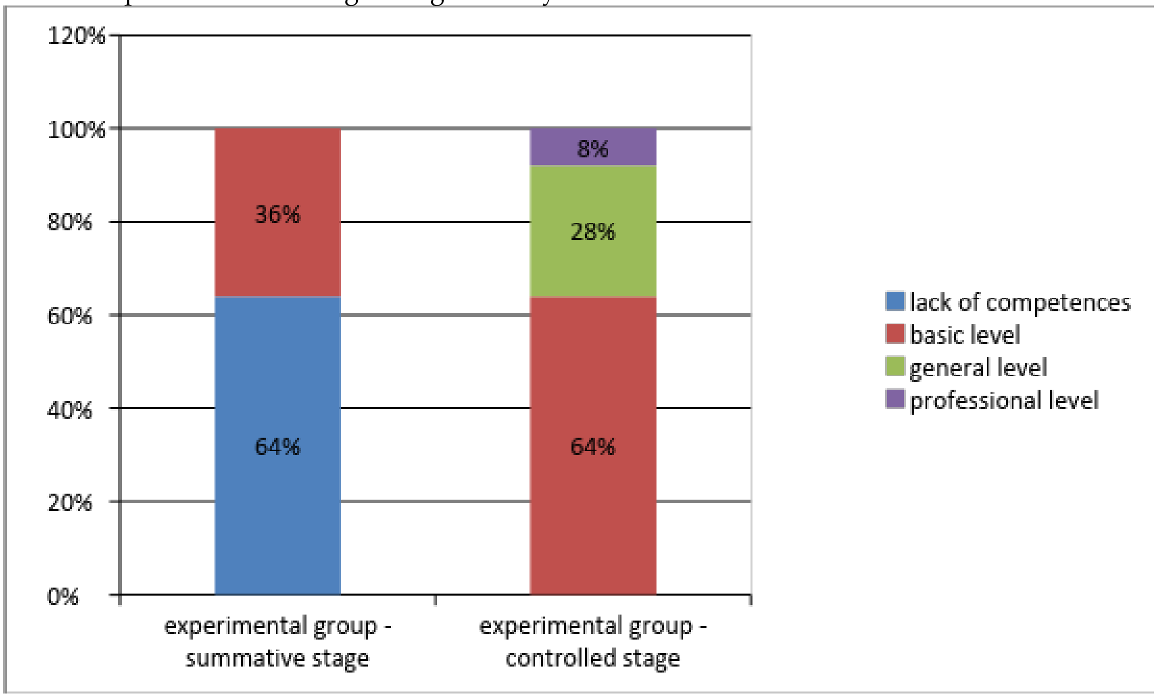

Fig. 2. The results of study of the maturity levels of the information and communication expertise among teachers from the experimental group on the summative and controlled stages of research

The results of the research data of the control group showed that 12.0% of teachers had a general level of the information and communication expertise; 60.0% of teachers from the controlled group had a basic level of competences; and 28.0% of teachers lacked such competence. Nobody from the control group had a professional level (Fig. 3).

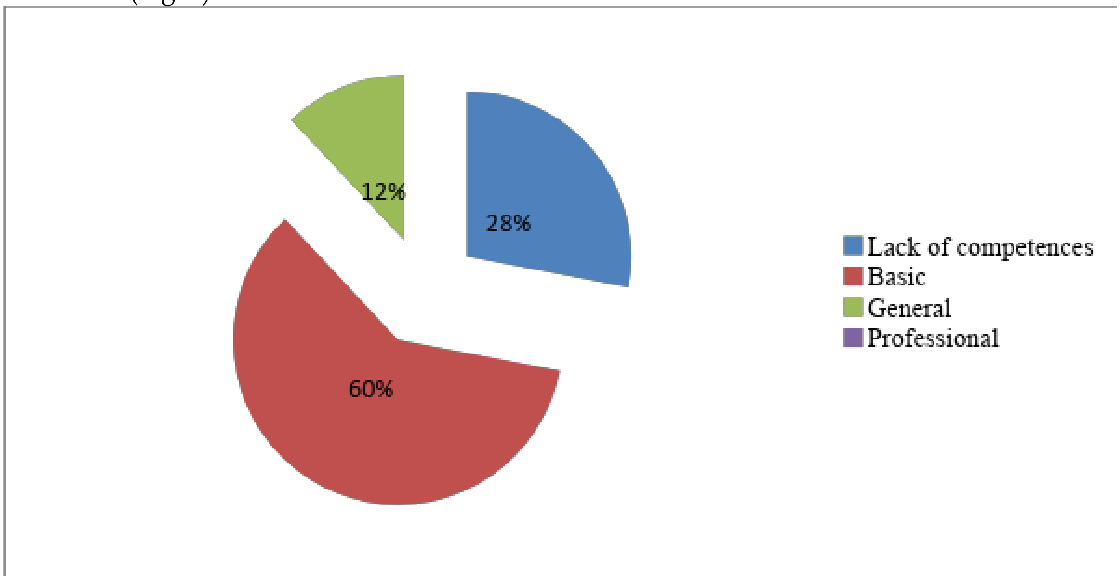

Fig. 3. The results of study of the maturity levels of the information and communication expertise among teachers from the control group

Fig. 4 shows comparative results of the maturity levels of the information and communication competences of teachers from the control group on the summative and controlled stages of research testifying that the indicators of the basic, general and professional levels of the information and communication expertise of teachers from this group did not undergo any significant change in terms of the competences development. Only a minimal shift is noted in the sphere of development of the information and communication competences among the small percent of teachers from the control group on the controlled stage of the research activity.

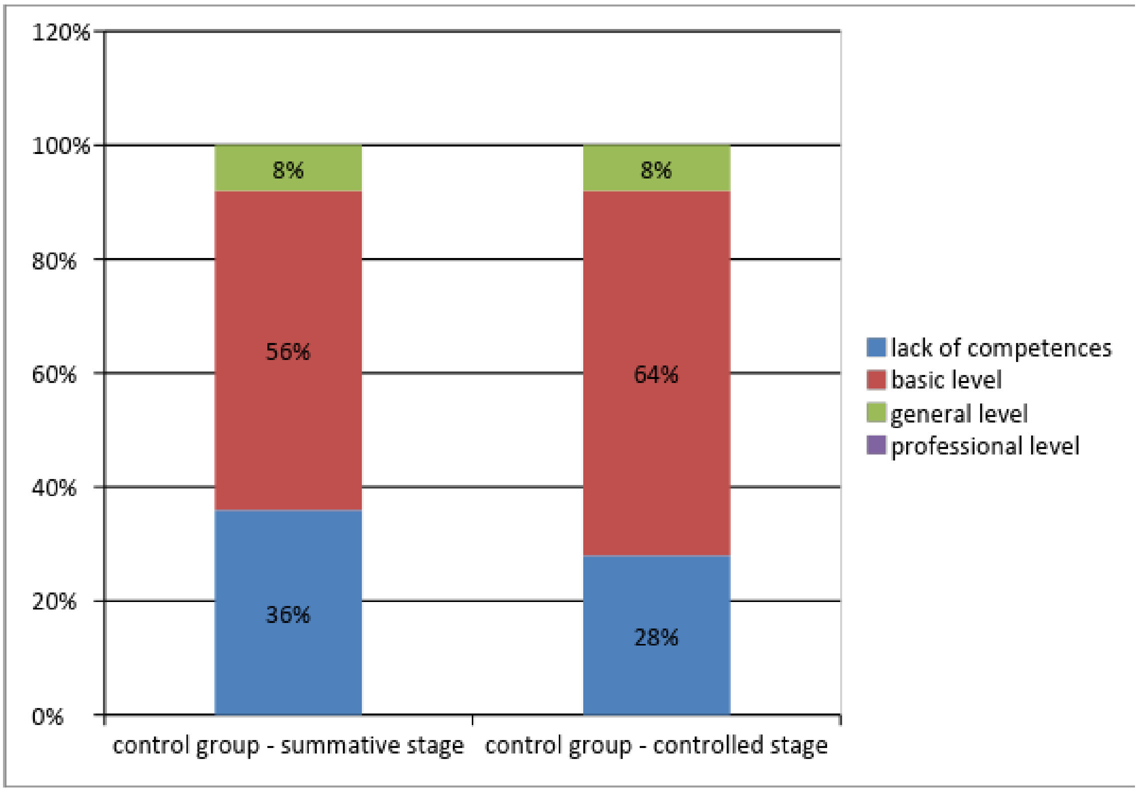

Fig. 4. The results of study of the maturity levels of the information and communication expertise among teachers from the control group on the summative and controlled stages of research of the teachers from the control group

Study of the motivation levels of teachers from the experimental and control groups to learn and introduce the information and communication technologies into the educational process and professional activity showed that there were significant changes in the motivation level of teachers from the experimental group.

There was registered positive motivation in the experimental group in 100% of cases among teachers at the age of 20-40 and in 86.0% of cases among teachers at the age above 40. There was registered positive motivation in the control group in 85.0% of cases among teachers at the age of 20-40 and in 50.0% of cases among teachers at the age above 40.

Sustainable interest to learn and introduce the information and communication technologies into the educational process and professional activity was revealed in 100% of cases among teachers at the age of 20-40 and in 68.0% of cases among teachers at the age above 40 (experimental group). In the control group there was noted a sustainable interest in 85.0% of cases among teachers at the age of 20-40 and in 50.0% of cases among teachers at the age above 40.

Aspiration for the independent study and introduction of the information and communication technologies into the educational process and professional activity was revealed in 65.0% of cases among teachers at the age of 20-40 (experimental group) and in 58.0% of cases among teachers at the age above 40. In the control group the aspiration for the independent study and introduction of the information and communication technologies into the educational process and professional activity was revealed in 53.0% of cases among teachers at the age of 20-40 and in 33.0% of cases among teachers at the age above 40.

Lack of interest to study and introduce the information and communication technologies into the educational process and professional activity was revealed in 25.0% of cases among teachers at the age of 20-40 (control group) and in 33.0% of cases among teachers at the age above 40.

The obtained data of analysis of the maturity level of the information and communication expertise and motivation level of teachers from the experimental group testify the efficiency of the developed model of management of the process of development of the information and communication competences of teachers in a preschool educational organization.

Discussion

The results of the summative stage of the research activity showed that the maturity level of the information and communication expertize of the teachers from the experimental and control groups on the initial stage is fairly low.

Also the low level of motivation to master and introduce the information and communication technologies is noted on the initial stage among teachers at the age of 40 and above.

These initial data were laid as a basis of the programme "Development of the Information and Communication Expertise of a Teacher in a Preschool Educational Organization" and developed motivation system for teachers.

During the formative stage of the research activity there were provided the following required conditions facilitating the development of motivational and psychological readiness of a teacher of an educational organization for professional development in the area of information and communication technologies:

- creation of an optimum model for management of development of the information and communication expertise of a teacher;
- development of a special programme with due account for the initial level of competences;
- creation of the motivation system for teachers;
- technical equipment of work places;
- systemic nature of studies on certain subject-matter with the subsequent introduction of the knowledge obtained into practical activity;
- creation of conditions to master the knowledge obtained;
- entering amendments in the system of methodological work;
- creation of the situation of success, demonstration of achievements.

On the stage of the controlled experiment the results were obtained reflecting the growth of the maturity level of the information and communication competences and motivation among teachers from the experimental group, whereas the same indicators of the teachers from the control group practically did not change.

The modern information society sets a task for the educational institutions to train specialists capable of:

1) adjust flexibly to changing life situations obtaining the required knowledge on one's own, and applying them skillfully in practice to settle the diverse emerging problems in order to be able to find one's place throughout the whole life;

2) have independent critical thinking, ability to see the emerging problems in reality and search for rational solutions using modern technologies; be fully aware of where and how the knowledge obtained can be used in reality; be able to generate new ideas, and think in a creative manner;

3) to deal with the information skillfully (be able to collect facts required for settlement of a certain problem, analyze them, hypothesize a solution, make the required generalizations, comparisons with the similar or alternative solutions, establish statistical regularities, make reasoned conclusions, apply the conclusions obtained to reveal and settle new problems);

4) be communicative, easy to get on with in different social groups, be able to team up in various spheres.

The results of the research activity enabled to confirm the hypothesis: management of the process of development of information and communication competences of a teacher in a preschool educational organization is efficient if teachers have a mature motivational readiness to master the information and communication competences; diagnostic methods to determine the level of mastery of the competences were developed; conditions were created for practical introduction of information and communication technologies by teachers into the education space of a preschool educational organization.

Conclusion

The developed model for management of the process of development of the information and communication expertise of teachers included a set of special measures facilitating introduction of the information and communication technologies into the educational process.

It includes documentation maintenance in electronic form, creation of a multimedia library with a selection of video plots, preparation of multimedia presentations for teacher-parent meetings and teachers' councils.

The following master classes were arranged during the research activity: "Development of Interactive Physical Activity Breaks," "Creation of Cartoons in Power Point Programme," "Development of Trivia Games on the Basis of Microsoft EXEL Spreadsheet," open displays of educational activity using laptop computers and interactive board, online conferences "Introduction of ICT into the System of Preschool Education," "Informational Expertise of a Teacher as One of the Lead Directions of Self-Development," "Game Computer Technologies."

The teaching personnel took an active part in the Internet contests where it placed. These are such contests as "A Teacher of the XXI Century," a contest of methodological elaborations the on artistic and aesthetic development, festival of innovative practices, "information and communication technologies in education" workshop and other.

At the same time there was specified a brand of the nursery "Interactive Childhood," and were developed and introduced into practice the methodological development "Computer Technologies as a Means of Development of Artistic and Creative Skills of a Preschool Child," innovative project "Electronic Didactic Games as a Method of Development of the Intellectual Potential of a Preschooler" and the programme of additional education on robotic technology on the basis of LEGO Education designer. At the same time the activities were performed to establish a single information and education environment of a preschool organization.

The developed and approved programme "The Development of the Information and Communication Expertise of a Teacher" and research materials can be used by methodological departments of the Republic, city, district and specific educational organization.

The use of the information and communication technologies in the educational process of preschool educational organizations is an imperative of our time enabling to engage children into active work and arouse the aspiration to obtain knowledge.

The positive aspects of using the information and communication technologies are that in the process of work on computers memory and attention of children improve. Computer is indispensable in this case since it transfers information in a form attractive for a child which not only accelerates memorizing of the content but also makes it meaningful and long-term. Children's working on computer is important for motor development as well. In any games children should learn to press certain buttons with their fingers, which develops minor muscles of hands. Dealing with the electronic computing machines arouses vivid interest of children as a play activity first and academic afterwards.

However while working on computer the human body is subjected to certain loads characterized by mental, visual and physical strain.

Today the information and communication technologies, especially the Internet, become a centre of attraction for children thanks to accessibility and appeal especially in metropolitan cities turning into an essential element of socialization, and replacing traditional forms of social activity (walks and games outdoors, reading books etc.) by new ones, formed by modern technologies. The interest to this subject-matter is essentially associated with the problem of security of children in the virtual space, since the Internet is not only an area for development of children but also a risk area for their psychic and physical health and social well-being [26, 27].

The older the child, the more Internet resources he/she uses, therefore the higher the risk to encounter negative and hazardous information.

But active use of a computer in the academic and corrective process arouses concern of both parents and teachers regarding the impact on the health of children.

Being a public resource, the Internet represents an essential method of personal and professional communication and provides incredible opportunities for discoveries and creative activity. However, its use is associated with certain risks and malicious intents. It is an open Window to the world which belongs to adults as well and contains unsuitable materials for children. The major part of the materials available on the Internet is improper for the minors. In this regard, one should follow certain safety rules which are comparable to the driving regulations and shall be observed irrevocably.

And most importantly, one should remember: "A child learns what he/she sees at home!" For this very reason when children start dealing with the global Network the rest of the family members should be an example for him/her.

The information and communication technologies are necessary, but time of the Internet use should be limited and websites for children are required.

Abstract

The urgency of the problem under investigation is caused both by the dynamics of the criminal procedure legislation, accompanied by implementing international experience in differentiated criminal proceedings in the Russian legal field, as well as by the difficulties arising in the activities of criminal justice authorities during simplified investigation (according to Chapter 32.1 of the Criminal Procedure Code of the Russian Federation). The purpose of the article is to characterize (on the basis of an integrated approach) the problems of criminal procedure regulation for preliminary investigation in Europe and the United States, and to work out the best practical ways for treating controversial situations arising in case of simplified proof. The leading approach to this problem is the comparative legal method which was used in studying foreign legislation regulating the reduced form of pre-trial proceedings in criminal cases. Analysis of crime data is based on the statistical method, on questioning 80 law enforcement officers and judges, and on analyzing materials of 58 criminal cases where the inquiry was conducted in a simplified manner. The study revealed that the Russian model of pre-trial proceedings differs significantly from foreign ones, and taking into account the essential features of the subject and procedure, it can be determined as mixed, combining elements of the Anglo-American and Continental models. The increase in criminal cases carried out with deadline violations, as well as in unsolved crimes of small and medium gravity testifies to the need to optimize pre-trial proceedings and to create an effective evidence mechanism to simplify the procedure for conducting an inquiry. The materials of the present study can serve as a basis for constructive scientific discussion and further development of the differentiation of the criminal procedure form, as well as for practical recommendations on applying Chapter 32.1 of the Criminal Procedure Code of the Russian Federation and on clarifying certain regulations.

Keywords: pre-trial proceedings, simplified inquiry, accused, criminal case, crime, indictment.

Introduction

The prompt and qualitative inquiry guarantees the legality and validity of decisions made in the criminal case, and, accordingly, guarantees restoring the violated rights and freedoms of citizens. At the moment, the issues related to improving the effectiveness of the preliminary investigation in the context of differentiation of its forms aimed at reducing the time, financial and other costs associated with pre-trial proceedings have been actualized. After the introduction of Chapter 32.1 of the Criminal Procedure Code of the Russian Federation which regulates the production of simplified inquiries, it became necessary to adapt scientific thought to new legal conditions for evidence-based activities, both within the framework of a unified inquiry and in its reduced form.

Statistical data indicate that the inquiry is in demand as an independent form of investigation, taking into account the gravity of the committed act. Thus, in 2015, 2,166,400 crimes were registered of which 887,800 crimes were initiated and investigated in the form of preliminary inquiries, which amounts to 75.5% of the whole array of criminal cases. In 2016, similar indicators were at the level of 76.8% (950.7 thousand crimes out of 2352.1 thousand recorded crimes) [1]. The apparent increase in crime in recent years with an increase in crimes investigated in the form of an inquiry led to a significant increase in the burden on investigators. This fact, combined with the decline in the quality of pre-trial proceedings noted in recent years [2] predetermined the need to search for the optimal form of preliminary investigation, which is a top priority task not only for the legislator, but also for the procedural science. The lack of a clear doctrinal model, in our opinion, entails inconsistency, proliferation and contradictory legal regulation of the production of inquiry.

In addition, in the special literature there are proposals to merge the investigation and inquiry into the general procedure of preliminary investigation [3], which requires a careful analysis of the general and specific features of each of these forms of investigation, as well as the practice of applying the procedural law in the continental and Anglo-American systems.

Traditionally, in the foreign criminal procedure legislation, the principle of procedural economy is the determining in building a model of (pre-)trial proceedings. This is not surprising, since it fits into the overall integration process of the criminal procedure legislation development, reflected in international legal acts. In 1987, the process of streamlining criminal proceedings with varying degrees of intensity in individual countries was legally enshrined in the Recommendations of the Committee of Ministers of the Council of Europe No. 6 R (87) 'Concerning the simplification of criminal justice', where it was indicated that red tape in the investigation of criminal cases inevitably discredits the criminal justice, and also affects the proper administration of justice. The main directions of increasing criminal justice effectiveness were: developing simplified criminal prosecution, introducing combined inquiries, expanding the scope of implementation of alternative methods for resolving criminal and legal conflicts [4]. Simplification of pre-trial proceedings should, in the opinion of the international community, be carried out with the essential observance of the basic rights and freedoms of citizens, set out in Chapters 5 and 6 of the Convention for the Protection of Human Rights and Fundamental Freedoms [5].

Methodology

The methodological basis of the research is the dialectical method of cognition, as well as general theoretical methods based on it: analysis, synthesis, induction, deduction, ascent from the abstract to the concrete, etc. The validity of the conclusions and recommendations contained in the article is provided by the integrated application of general and private scientific methods: logical, comparative legal, statistical, sociological and others.

When studying the essence of a simplified model of pre-trial proceedings, system-logical analysis and synthesis were used, which made it possible to identify the characteristics of a simplified inquiry (which has the traits inherent in the protocol form of pre-trial materials preparation). The study of theoretical problems of differentiation of the criminal procedure form was carried out using the method of ascent from the abstract to the concrete, which made it possible to determine signs and limits of inquiry simplification in the Anglo-American and Continental systems of law. Comparative legal method was used in studying foreign and Russian experience of simplifying the criminal procedure form. The empirical part of the study is based on the application of the statistical method, on questioning 80 law enforcement officers and judges, and on analyzing 58 criminal cases, examined in accordance with Chapter 32.1 of the of Criminal Procedure Code of the RF.

Results

A comparative legal analysis of simplified pre-trial proceedings models revealed the main trends of deviation from the unified procedure: reduction of the procedure terms in a criminal case; and changing the range of the rights and duties of participants in criminal proceedings.

Implementation the international principle of a reasonable period of criminal proceedings (Chapter 6.1 of the of Criminal Procedure Code) in the Russian legislation was a prerequisite for introducing a simplified inquiry institute, and the stage of gathering evidence was significantly simplified, which had a direct impact on the legal status of the participants in the criminal process.

The process of differentiating forms of criminal justice with the aim of increasing its efficiency should be developed by introducing new forms of pre-trial proceedings borrowed them from previous domestic and existing foreign experience, in particular the protocol form of pre-trial materials preparation, taking into account the current provisions of the Constitution of the Russian Federation.

Discussion

Various aspects of pre-trial proceedings in the form of inquiry at different times became the subject of independent scientific research. Taking into account the accumulation of practical experience and the doctrinal development of the conceptual nature, the research range of the preliminary investigation was consistently expanded, and significant theoretical and practical recommendations for improving the inquiry were proposed, which determined the dynamics of this procedural institution development. It should be noted that a comparative legal analysis of various forms of pre-trial proceedings in Russia and abroad at different times was conducted by S.V. Bobotov, K.F. Gutsenko, L.V. Golovko, M.A. Peshkov, N.N. Polyansky, B.A. Filimonov, MA Cheltzov-Bebutov, A.I. Lubensky, etc. Certain issues of inquiry proceedings taking into account the recent legislative innovations are considered in the works by V.A. Azarov, E.H. Arestova, S. S. Bezrukov, N.V. Bulanova, V.N. Grigoriev, A.C. Esina, S.P. Efimichev, M.M. Kuzembaev, V.M. Lukin, S.L. Maslenkov, A.G. Mamontov, I.A. Morozkina, N.I. Revenko, G.I. Sedova, V.V. Stepanov, etc. However, it is necessary to focus on the fact that the institute of inquiry is in constant dynamic development, which actualizes the need to develop an effective mechanism for investigating crimes of small and medium gravity, referred to the competence of the relevant bodies. In this regard, in spite of the extensive bibliography, further scientific development in line with the indicated problem are in demand. In addition, beyond the scope of scientific research are many questions of comparative legal study of various models of simplified pre-trial proceedings in Europe and the United States, the peculiarities of implementing certain provisions of foreign legislation in Russian criminal proceedings, and the analysis of the essential characteristics of a simplified inquiry.

Preliminary investigation in the vast majority of national legal systems can be determined as an inquiry effectuated (unlike the Russian model) mainly prior to initiating criminal proceedings and having a pronounced summary character.

Let's consider several inquiry models existing in the foreign criminal procedure legislation. The most typical example of speeding up the process of investigation is the criminal procedure adopted in France; it had the greatest influence on the organization of pre-trial stages of criminal proceedings in almost all of Europe, including Russia. At present, the inquiry in France is regulated by the Criminal Procedure Code of 1958 having a section on 'Inquiry and Identity Verification' [6]. A distinctive feature of the inquiry in the normative act under consideration is that it does not form a single stage with the investigation but is conducted prior to the initiation of criminal proceedings for the purpose of identifying the person who committed the crime without issuing a final procedural act (in the case of Russian criminal procedure legislation, it is before the initiation of criminal proceedings). It should be noted that the form of criminal proceedings under consideration almost completely excludes any rights of persons involved. Only the bodies of inquiry have actual powers, and the suspect as the procedural figure is not mentioned at all in the corresponding chapter of the Criminal Procedure Code of France.

In Austria, a preliminary investigation is carried out in a single form – as an inquiry. It should be noted that urgent investigative actions related to the identification of the person who committed the crime, as well as of other circumstances, are conducted by the police prior to the initiation of criminal proceedings and are completed by the transfer of all the materials to the prosecutor. This specificity, in our opinion, is due to the existence of 'free evidence' which is not related to the procedural form and is not regulated by law. In order to establish the circumstances of the crime, the body of inquiry has the right to conduct any investigative and operational-search activities. The prosecutor involves an investigating judge if interrogating the accused and key witnesses in the case is necessary. The end of the inquiry is possible either through the initiation of a public accusation, or by case termination [7, 8]. In the first case, the prosecutor makes an indictment which indicates the information about the accused, the place and time of the crime, the qualification of the act, and lists the evidence collected. The indictment together with the materials of the criminal case goes to the court. The usual inquiry is carried out within 15 days and the judicial (with the involvement of the investigating judge) within up to 30 days (Chapter 174 of the Criminal Procedure Code of Austria [9, 24].

An approximately identical model of inquiry is contained in the criminal procedure legislation of the Netherlands. Pre-trial verification of the circumstances of the crime committed takes place before the decision to initiate a criminal case, therefore, is not subject to the requirements of the criminal procedure form reduced to 7 days and ends with the written protocols being forwarded to the prosecutor to resolve the issue of prosecution. The prosecutor, having made a decision to initiate a criminal case, has the right to involve an investigative judge to produce the necessary investigative actions, thus complicating the procedure of inquiry, or to send materials to the court with an indictment if the circumstances of the crime are obvious [10, 23].

Pre-trial proceedings are completely absent in cases of crimes of minor gravity, according to Chapter 447 of the Criminal Procedure Code of the Republic of Poland [11]. The accelerated proceedings are sufficiently popular if the person does not have the status of a suspect, and so is the opportunity to exercise the right to defense until the case termination (Chapter 331 of the Criminal Procedure Code of the Republic of Poland). In this case, the investigation should be completed within 2 months; the prosecutor can extend this period to 3 months. When sending a criminal case to court, investigative bodies are obliged to immediately notify the public prosecutor about this, and also present all the evidence collected.

Free evidence is used in an inquiry under the legislation of the Czech Republic [12, p. 27, 13, p.7]. The authors of this paper believe the analogy of this procedure is the verification of the crime report conducted in the manner provided by Chapter 144 of the Criminal Procedure Code. Such conclusion can be drawn on the basis of the list of activities that constitute the process of free evidence under the Czech law, namely: the obtaining and seizure of objects and documents, the seizure of funds in a bank account, securities, real estate, other assets or their equivalent, the obtaining of explanations, experts opinions, seizure of samples for comparative study, examination, and detention of a person. The law stipulates the inadmissibility of interrogation and identification, except for the cases when it is impossible to postpone and effectuate them in the trial. The period of simplified pre-trial proceedings is not more than 14 days since the date of notification of suspicion. If simplified proceedings cannot be completed, the prosecutor subject to the circumstances of the case extends the term for another 10 days or instructs the appropriate police authority to initiate criminal proceedings and conduct a preliminary investigation.

In accordance with Chapter 314 of the Czech Code of Criminal Procedure, if at the end of the simplified proceedings the police does not decide to terminate the criminal case, they submit to the prosecutor a summary of the results indicating the crime which court evidence substantiate the suspicion [14, p. 81].

Special studies on the comparative legal analysis of pre-trial proceedings in Russia and European countries point out that in the framework of simplified criminal proceedings in different countries of Europe, 15 to 22% of crimes of small and medium gravity are annually solved [15, p. 150], which indicates the high efficiency and practical relevance of simplified proceedings. The questioning of the criminal justice bodies employees showed the overwhelming majority of the respondents (83%) believe it is the preliminary verification of the crime report which is the most effective way to establish the circumstances of the crimes of small gravity. In this regard, part of the respondents (43.6%) supported the restoration of the institution of a protocol form of material preparation that existed in the previous legislation and was designed in analogy with the pre-trial proceedings provided for by the French criminal procedure law.

The police inquiry in the criminal proceedings of the USA has significant differences, primarily due to the Anglo-American legal system which is based on the use of precedent as a source of criminal procedure law. A distinctive feature of the organization of pre-trial proceedings in the United States is the absence of a single normative legal act regulating this activity [16, 14]. However, this does not mean the absence of any regulation – legal regulation is carried out by federal legal acts which are considerably general in nature, as well as laws and administrative legal acts of the state. Thus, in fact, there are 50 legal systems (by the number of states).

Another peculiarity is the strong differentiation of bodies authorized to conduct a preliminary investigation. In the absence of a central agency with police functions, the leading investigative body is considered to be the Federal Bureau of Investigation (FBI). At the same time, there are other police forces that are part of the structure of various federal agencies (for example, the Drug Enforcement Administration (DEA) and the Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF), along with the FBI in the structure of the US Department of Justice), state authorities or local authorities, and investigating crimes within their competence.

Officers of US police agencies are assigned both tracking and investigative powers. Since in the criminal process of the United States, as in a number of European countries, there is no stage of initiating criminal proceedings, an inquiry is reminiscent of a pre-investigation check conducted by domestic operational investigative bodies with the possibility of implementing the entire range of investigative actions. In this case, the actions of police officers restricting the constitutional rights of citizens (for example, search and arrest) are possible with the permission of the attorney and the court. Observance of the rights and freedoms of citizens, enshrined in the Constitution of the United States or the Constitution of the individual state, is perhaps the only restriction in the choice of means and methods for conducting inquiries by the US police. Among the procedural measures limiting the constitutional rights of citizens, the search and arrest was subject to most detailed regulation. The procedure for the implementation of these measures is regulated in Title 18 of the Code of Laws of the United States [17] and the Federal Rules of Criminal Proceedings [18], as well as a number of decisions of the Supreme Court of the USA [19].

An essential distinctive feature of the inquiry carried out by the US police authorities is the absence of the need to observe the procedural form and to compile the procedural documents. Fixing the progress and results of the investigative actions is carried out by the policeman in the notebook and the final report on the investigation of the criminal case which are official documents yet not a source of evidence according to the Russian criminal process; nor is the protocol, the compiling of which in the process of investigating a crime is provided for by laws of some US states. These documents can be used by the police in the process of obtaining evidence of a particular crime and are of an auxiliary nature. On the basis of these documents, the head of the police body checks the sufficiency of the materials received and decides on the further 'fate' of the case: either to transfer it to the attorney for the prosecution or to solve at the level of the inquiry body ('police settlement of a recognized criminal conflict') [20, p. 17].

Such order of inquiry is conditioned, in our opinion, by another approach to determining the essence of evidence and proof. First of all, it is characterized by a presumption that 'state officials always act lawfully'. On the other hand, there is strict control by the attorney who enters the process from the moment of arrest or charge. Evaluating the collected evidence from the point of view of the legitimacy of the methods for obtaining them (admissibility), the attorney has the right to refuse the evidence which was obtained by questionable methods. If the attorney finds the evidence admissible and sufficient for pressing charge, they make an indictment and pass it to the judge. It should be noted that the attorney decides to initiate criminal prosecution only if they believe they are able to win the case [25, 26].

Along with the findings based on the investigation materials, the police submit to the Attorney's office a request for an arrest warrant or search warrant. Without the attorney's consent, direct appeal for the warrant to the magistrate judge is practically useless, since the prosecutor's subsequent refusal to effectuate prosecution on the basis of an order issued without his consent deprives this order of meaning [21, p. 79].

The materials of the investigation for which the offender was not established are not sent to the attorney but remain in the police. However, the US law does not provide for the possibility of suspending the inquiry due to the failure to identify the perpetrator, as well as for the need to extend the terms of the inquiry or to decide upon refusing to open a criminal case, which essentially distinguishes the pre-trial proceedings from the Russian model of inquiry.

The differentiation of the preliminary investigation in the Russian criminal process is in line with the general tendency to simplify (accelerate) the criminal justice process in order to optimize the form of proceedings in criminal cases of various categories. An analysis of the development dynamics of the criminal procedure legislation allows concluding there are two unified procedures (preliminary investigation and inquiry), the procedural rules of which are gradually converging, as well as the simplified inquiry. The main criterion for differentiation in this case is the level of complexity of establishing the circumstances of the criminal case. The simplified pre-trial proceedings implemented in the criminal procedure law has certain specific features, including: 1) the limitattions for a simplified inquiry expressed as a set of grounds and conditions for its proceedings; 2) a significant reduction in the time of the preliminary investigation; 3) restriction of the subject of proof solely to circumstances related to the crime, the nature and extent of the harm caused, and also the person's guiltiness, which accordingly reduces the number of investigative and other procedural actions conducted by the investigator within the framework of the investigation under consideration; 4) the consequence of a simplified inquiry in a reduced form which is the reduction of the trial stage provided for by Chapters 316 and 317 of the Criminal Procedure Code of the RF.

Conclusion

Comparative legal analysis of the criminal procedure legislation of the countries of continental Europe allows stating that the introduction of simplified inquiries into Russian legislation and the gradual approximation of the procedures for preliminary investigation and inquiry are in line with the general world trend of optimizing pre-trial proceedings in criminal cases. The speed and effectiveness of the activities of the criminal justice authorities in modeling the stages of initiating a criminal case and preliminary investigation by introducing 'free evidence' is achieved by significantly shortening the terms of the preliminary investigation, which is often conducted prior to the initiation of the criminal case, or prior to its transfer to the investigative judge. As a guarantee of the realization of the rights and freedoms of citizens that are not subject to restriction in accordance with Chapters 5 and 6 of the Convention for the Protection of Human Rights and Freedoms, the legislation of the majority of the countries of continental Europe provides for the procedural possibility of a transition from a reduced to a unified procedure under certain grounds and conditions.

An analysis of the procedural order of the preliminary investigation in the form of an inquiry allows asserting that it retains a number of specific features which make it possible to delimit it from a preliminary investigation. These are as follows: 1) criminal cases being in the investigative bodies' jurisdiction; 2) the term of the inquiry; 3) he procedural status of the person against whom the inquiry is conducted; 4) application of preventive measures in the course of the inquiry; 5) the end of the inquiry by an indictment. The indictment contains two separate procedural decisions: on involving a person as a defendant with the formulation of the final charge, which is the result of the prosecutorial activity in the course of pre-trial proceedings, as well as the decision to end the preliminary investigation with the formulation of conclusions, which, according to its results, will be presented to the court.

Recommendations

The materials contained in the present study can be useful for further scientific research of the problems of differentiating the criminal procedure form and of optimizing the inquiry procedure. According to the authors' opinion, they enrich scientific knowledge about simplified forms of criminal justice, which should be oriented not only to increasing its effectiveness in terms of financial, resource and time costs, but also to solving the tasks formulated in Chapter 6 of the Criminal Procedure Code of the RF. The conclusions and recommendations formulated in the work can serve as a basis for constructive scientific discussion and further development of the theoretical foundations of the problems raised.

The practical value of the materials lies in the possibility of their use in the activities of the criminal justice authorities, as well as in the further reform of the criminal procedure legislation. The provisions formulated in the study can be used in teaching a course in the criminal process and relevant special courses for students of law schools, as well as in advanced training of practitioners.

Criminological policy and legislation in the area of combating crime related to trafficking in persons

Lyudmila A. Bukalerova[1] and Alimzhan B. Bekmagambetov[2]
1.Head of the Chair of Criminal Law, Criminal Procedure and Criminalistics of the RUDN Peoples' Friendship University of Russia (RUDN), Doctor of Law, Professor. Russian Federation.
2. Ph.D. in Law, Deputy Director for Science Chelyabinsk State University, Doctoral candidate of the RUDN Peoples' Friendship University of Russia

Abstract

1. The objective of this publication is to once again focus on the issue of improving the combating trafficking in persons from the perspective of global approach - developing the optimal integrated policy model that includes a number of elements (subsystems).

2. The methodology used by the author includes, first of all, an interdisciplinary analytical approach along with the system-structural-functional characteristic of genetically related elements of a single complex system as a product of theoretical modeling.

3. In accordance with the author's approach, the global and national policies on criminal and penal law, criminally-remedial, operational search and criminalistical subsystems should be included among the subsystems of the policy on combating crime related to trafficking. Author also underscores the necessity of clear reflection of the official terminological turnover within the framework of an integral conceptual-categorical apparatus of the Concept of Legal Policy of the Republic of Kazakhstan.

4. Addressing to further theoretical modeling of trafficking crime prevention policies, the issue of the concept, content, and position of criminological policy in the structure of an anti-criminal state mechanism is being considered. Hence, the researcher focused on the correlation of penal and criminological policies; in this reference there are two polar scientific contemplations (where penal policy is a part of the criminological structure and vice versa), which also evolved due to the discrepancy between criminal law and criminological science. Therefore, the legal writer expresses solidarity with the position of leading experts on the necessity to strengthen integration between relevant branches of science, including such challenging areas as criminal science and criminology of penal law (justice). Based on the fundamental scientific concepts, the author presents the structure of criminological legislation in the area of combating trafficking crime; and also underscores the criminogenic gap expressed in the absence of a basic law on combating trafficking.

5. The results obtained will serve the purpose in the area of law-making, law-enforcement and human rights policies, aimed at ensuring the proper level of criminological security of the personality, society and the state.

6. The social consequences of the development and implementation of a holistic concept of anti-crime policies related to trafficking in persons will be expressed in enhancing the effectiveness of law enforcement in protecting citizens from relevant criminal encroachments.

Keywords: Criminological policy, Penal policy, Criminological law, Criminological legislation, Human trafficking.

Introduction

2017 was the year when the Action Plan of the Government of the Republic of Kazakhstan to Combat and Prevent Human Trafficking Crimes, approved by the resolution of Kazakhstan Government (decree no. 23) on January 28, 2015, was completed. The Action Plan included the following key areas: policy-making on improvement and alignment of legislation, which consequently contained such sections as standard-setting work on the improvement and alignment of legislation (4 paragraphs); organizational and practical activities for the combating trafficking in persons (8 paragraphs, including 7 sub-paragraphs); organizational and practical measures in rendering of assistance to victims of trafficking (6 paragraphs); cooperation with the proper authorities of the CIS member states and international non-governmental organizations (6 paragraphs), organizational and preventive countermeasures on trafficking (6 paragraphs); advisory and scientific-methodological support (4 paragraphs); and human resourcing (3 paragraphs) [1, P. 211-223]. It stands to reason that it will be subjected to a thorough analysis by the interdepartmental commission, following which the final documents with practical recommendations will be adopted.

The author of this article as a member of the expert council of the Commission on Human Rights under the President of the Republic of Kazakhstan is up to take part in this legislation, as well as he participated in the international presentation of the analytical report on "Current Problems in the Protection of the Rights of Migrant Workers and Victims of Trafficking in Persons in the Republic of Kazakhstan" held on September 14, 2017 in the Ministry of Foreign Affairs. This report also states that "In this respect, Kazakhstan has to solve a complex problem of the creation of a modern migration management system that would prevent an outflow of skilled personnel abroad" (Analytical Report: Current Problems in the Protection of the rights of Migrant Workers and Victims of Trafficking in Persons in the Republic of Kazakhstan, under the general editorship of Kuanysh Sultanov and Tastemir Abishev, Astana, 2017. 179 p.: Commission on Human Rights under the President of the Republic of Kazakhstan) (Page 6).

All of the above aspects of diverse activities testify, or at least give grounds to assert about the prerequisites for the formation of a separate direction - criminological policy in the area of combating criminal challenges and threats, where human trafficking occupies one of the leading positions. And this is of the constant attention of the relevant UN structures; besides, the Republic of Kazakhstan has become the President of the United Nations Security Council since January 1, 2018.

The forth planned systematic and effective countermeasures of crime in modern conditions are mainly dependent on the quality of modeling and modernization of criminological policy as one of the subsystems of global criminal (penal/executive) policies.

At the official level, this aspect is constantly prevailing not only under attention of the government and criminal justice, but also is a subject of a "field practice". This is evidenced by the establishment of the Interdepartmental Research Institute of the Academy of Law Enforcement Agencies under the General Prosecutor's Office of the Republic of Kazakhstan. Those establishments have already conducted a number of meaningful and constructive dialogue platforms, training seminars and meetings. Among them are the International Scientific Conference "From criminological legislation to the combat crime justice (problems of law criminology)" (held on May 19, 2017 by Kostanay *akimat*; prosecutor's office of Kostanay region and Kostanay branch of Chelyabinsk State University); International Scientific Conference "Actual issues of public security and combating crime" (November 16, 2017, Academy of Law Enforcement Agencies of the Prosecutor General's Office of the Republic of Kazakhstan); Legal Forum on Criminology "The suspect and the accused: are their rights really protected?" (December 14, 2017, also by Academy of Law Enforcement Agencies of the Prosecutor General's Office of the Republic of Kazakhstan); and joint meeting with the Prosecutor's Office of the Kostanay region under the name of "Crime Prevention through Criminological Conceptual Foresight" (December 25, 2017, Astana - Kostanay, Academy of Law Enforcement Agencies of the General Prosecutor's Office).

From the point of view of theoretical and instrumental analysis, the criminological direction of the counteraction policy should have its own legislative basis, which should represent the new branch - criminological law, - a proposed product of the Neva-Volgian scientific school; criminology of law (by D.A. Shestakov); or criminology of penal law (justice) (by S.F. Milyukov). As an apotheosis of the entire process of theoretical modeling in this area it is possible to consider the construction of a single law system to counteract crime. Therefore, it is entirely essential to agree with Anatoly P. Danilov that "foreign colleagues are lacking similar proposals; and the Russian criminological theory is ahead of its western development" [2, page 71].

Results obtained from the conducted sociological survey, in which the legal writer participated as a respondent, are also very challenging. The majority of the respondents (55 individuals or 65.5%) required the adoption of a single crime prevention legislation (as stated by the above-mentioned researcher); 13 people among them had a degree (81.3% of the total number of such) [3, p. 72]. The concept of Yuri D. Goncharov is essentially similar; and excellent in content. In the structure of combating crime he allocates laws on counteraction and prevention policy [4, p. 264; p. 89].

However, in context of this report the dominant object will be such an object of study as the policy on criminology, which has not only been insufficiently developed, but has not yet firmly established itself in the corresponding literature; and has not received in-depth study and development. At the same time, it is naive to ignore the fact that the policy in the area of combating crime existed and exists in any civilized state - and not only there. This goal is pursued in many studies, such as the one by Elizbieta M. Gozdziak, Elizabeth A. Collett, Research on Human Trafficking in North America: A Review of Literature // International Migration Volume 43, Issue 1-2, January 2005, P. 99-128 DOI: 10.1111 / j.0020-7985.2005.00314.x), p 99, advising to "note of the research gaps that need to be filled in order to establish appropriate and effective policies and programs for trafficked victims".

Yes, there are differences in approaches and results; however, this is a separate issue. Since the moment of realization of ensured protection necessity of a person, society and the state from criminal threats and challenges, counteract measures immediately appear. And the process of institutionalization, reformation and modernization takes place up to date.

In this respect the causes and factors are taken into account; it is ought to agree with Jill Robinson, stated that "at the institutional level of trafficking is viewed as a vastly complex social problem with structural (macro) level causes" (Public Perceptions of Human Trafficking in Moldova // Psychosocial Intervention Vol. 20, No. 3, 2011. P. 269-279 http://dx.doi.org/10.5093/in2011v20n3a4) (p. 270).

However, we cannot confine ourselves with a study of determinants only, since we are setting a global task to develop models of criminological policy and legislation. In this direction, one should be guided by international experience. As it was fair-mindedly noted by Jeana Fowler, Nicolette Che and Lindsay Fowler that "… most developing countries have yet to develop their national machineries to be strong enough to protect and rehabilitate victims" (Jeana Fowler, Nicolette Che, Lindsay Fowler // Innocence lost: The rights of human trafficking victims. Proceda Social and Behavioral Sciences 2 (2010) 1345-1349) (p. 1243).

John Barner, David Okesh and Meghan A. Camp are of the same opinion: "Many international anti-trafficking efforts are veered towards the criminal aspect of the phenomenon while placing less emphasis on the psycho-social services that victims and survivors require" (John Barner, David Okesh and Meghan A. Camp., Socio-Economic Inequality, Human Trafficking, and the Global Slave Trade // Societies. 2014, 4 (2), 148-160; doi: 10.3390 / soc4020148) (p. 145).

Louise Shelley, focusing attention on the transnational nature of this phenomenon, notes that: "By defining human trafficking as a crime problem rather than as a migration, human rights or security issue, the international community is recognizing that criminal law and law enforcement institutions must play a key role in addressing the problem of transnational human trafficking" (Louise Shelley / Human Trafficking in Human Trafficking (Maggie Lee Routledge (2007) P. 117 - 232).

Seo-Young Cho and Krishna Chaitanya Vadlamannati emphasize the complexity of the problem: "Over the past few years, the growing worldwide phenomenon of human trafficking has baffled many policy experts working on this problem" (Vadlamannati, Krishna Chaitanya and Cho, Seo-Young, Compliance for Big Brothers - An Empirical Analysis on the Impact of the Anti-Trafficking Protocol (January 5, 2017), European Journal of Political Economy, Vol. 28, 2012. Available at SSRN: https://ssrn.com/abstract=2894424) (p. 24).

Materials and methods

A review of doctrinal approaches and views in corresponding literature shows that in Kazakhstan, unlike the Russian Federation, the question of the essence, role and purpose of criminological politics is not so actively and widely discussed (what reflects the current state of domestic criminological science). The corresponding scientific knowledge area in our republic is connected with the names of many outstanding criminological scientists, and, of course, has its own serious basis; and therefore, appears to be a topic of a separate analysis. It should be noted that in this case neither in textbooks [5] and study guides [6], nor in monographic [7], dissertational [8] or grant [9] studies, criminological politics is not clearly distinguished and not covered in detail. Unfortunately, a number of scientific articles devoted to the problems of criminal policy (by concept and content) and strategies for combating crime do not contain information on criminological policy. In particular, it is possible to mention current publications by R. Dzhansaraeva [10], A. Eshchanova [11], M. Zholumbaeva [12] and R. Mukanova [13]. A monograph by Zh. Zhunusov and single purpose publications by professors T. Akimzhanov and G. Rustemova can be considered as an exception. More about them is discussed below.

Results

Statute: Criminological policy is a self-sufficient direction of state-legal activity in the area of combating crime, including the one related to trafficking in human beings; with its tools in the form of criminological legislation.

Nature: Criminological policy has a genetic relationship with the criminal law, a number of points of contact within the aspects of criminalization and decriminalization of acts that represents the fundamental foundations of criminal policy.

Concept and essence: Criminological policy is scientifically grounded activity of authorized state bodies, institutions, and their officials, concerned public organizations in the area of crime prevention, including a complex of criminological legislation measures relevant to international standards.

Criteria for optimal criminological policy (the concept of M. Kleimenov is taken as reference point):

1) Correspondence of national ideology, which is a synthesis of traditional national values of the country, including the inadmissibility of encroachment on personal freedom;
2) Increase of the spiritual and moral potential of society; implementation of cultural and moral policies in the direction of humanistic personal qualities education, including overcoming the deviations of the consumer society;
3) Attention priority to the prevention of crimes, including those related to trafficking in persons in the context of increasing the supply of "human commodity" to many foreign countries;
4) Severance of business and government by excluding the participation of civil servants in entrepreneurial activities, as well as of businessmen "bearing the same representation" in government;
5) Elimination of all legal immunities, with exception of diplomatic immunity;
6) Establishment of procedures for the public certification of certain categories officials with the participation of community leaders;
7) Formation of a curtain structure for revision of the property status and sources of income of state officials and employees of governmental organizations and institutions regardless of the form of ownership; as well as the compliance of their expenditures with legal income;
8) Strengthening of the state response and regulation of the economy;
9) Improvement of state social policy, elimination of unemployment, indigence and poverty; restoration of labor resources;
10) Reduction of alcohol and narcotics consumption;
11) Strengthening of the family values;
12) Protection of children from all kinds of exploitation, physical or psychological abuse, corruption and depravation;
13) Maintenance of the state of publicity and scientific character at legislative acts preparation;
14) Introduction of the institute of criminological expertise of normative legal acts;
15) Integrated utilization of all legal means (criminal law, administrative law, civil law, etc.) for the purpose of combating crime;
16) Correction of strains in the human resources policy in federal, regional and municipal authorities, law enforcement and judicial bodies; exclusion of corruptive practices of cronyism and nepotism;
17) Optimization of processes of criminalization and decriminalization;
18) General social responsibilities of business;
19) Further development of criminological legislation;
20) Protection of potential and rehabilitation of real victims of crime;
21) Education in the law;
22) Improvement of criminological management;
23) Decriminalization of regions, branches of economy and fields of activity;
24) International engagement and cooperation in the detection, suppression and prevention of crimes, including those related to trafficking in persons.

The purpose of criminological policy: generation of effective ways to identify the causes and prevent crimes, including those related to trafficking; and to contain it at a socially acceptable level in terms of adequacy to its resource arsenal.

The tasks of criminological policy: generation and provision of updated criminological information on the nature, causes and state of criminality to the concerned recipients; creation of a basis of approaches and methods for criminological estimation of the "cost of crime to society", its causal-relevant complex and personality characteristics of the perpetrator ("portrait of an offender"); definition of crime prevention measures; forms and methods development for managing subjects of crime prevention (governmental bodies, educational and other institutions and establishments) in order to implement their tasks to combat crime.

Criminological legislation: system of international and domestic legal acts of criminological content and orientation, enacted by the Republic of Kazakhstan.

To criminological legislation in the area of combating crime related to trafficking in persons:

International Legislation

- The 1926 Geneva Convention to Suppress the Slave Trade and Slavery
- The 1949 Convention for the Suppression of the Traffic in Persons and of the Exploitation of the Prostitution of Others
- The 1956 Supplementary Convention on the Abolition of Slavery, the Slave Trade, and Institutions and Practices Similar to Slavery
- The 1957 Abolition of Forced Labor Convention
- The 1979 Convention on the Elimination of All Forms of Discrimination Against Women
- The 1980 Hague Convention on the Civil Aspects of International Child Abduction
- The 1999 Convention concerning the Prohibition and Immediate Action for the Elimination of the Worst Forms of Child Labor
- The 2000 United Nations Convention against Transnational Organized Crime
- The Protocol to Prevent, Suppress and Punish Trafficking in Persons Especially Women and Children, supplementing the 2000 United Nations Convention against Transnational Organized Crime
- The Protocol against the Smuggling of Migrants by Land, Sea and Air, supplementing the 2000 United Nations Convention against Transnational Organized Crime
- The 2002 Brussels Declaration on Preventing and Combating Trafficking in Human Beings
- The 2005 Council of Europe Convention on Action against Trafficking in Human Beings
- The 2007 Council of Europe Convention on the Protection of Children against Sexual Exploitation and Sexual
- The 2005 Agreement on Cooperation of Member States of the Commonwealth of Independent States in the fight against trafficking in human beings, human organs and tissues
- "On the Program of Cooperation of the Member States of the Commonwealth of Independent States in Combating Trafficking in Human Beings for 2014-2018" CIS Heads of State Council Decision

International Bilateral Agreements

- The Agreement between the Government of the Republic of Kazakhstan and the Government of the Federal Republic of Germany on cooperation in combating organized crime, terrorism, and other serious criminal offences
- The Agreement between the Government of the Republic of Kazakhstan and the Government of the Islamic Republic of Iran on cooperation in combating organized crime and terrorism
- The Agreement between the Government of the Republic of Kazakhstan and the Government of the Republic of Bulgaria on cooperation in combating terrorism, organized crime, illicit trafficking of narcotic drugs, psychotropic substances, their analogues, precursors, and other types of crime
- The Agreement between the Government of the Republic of Kazakhstan and the Government of Romania on cooperation in combating organized crime, illicit trafficking of narcotic drugs, psychotropic substances and precursors, terrorism and other dangerous crimes
- The Agreement between the Government of the Republic of Kazakhstan and the Government of the

Republic of Poland on cooperation in combating organized crime and other types of crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the Arab Republic of Egypt on cooperation in the field of fight against terrorism, organized crime, illicit trafficking of narcotic drugs and psychotropic substances, and other types of crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the Republic of Croatia on cooperation in combating organized crime, illicit trafficking of narcotic drugs and psychotropic substances, terrorism and other types of crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the Slovak Republic on cooperation in combating organized crime, terrorism, illicit trafficking of narcotic drugs, psychotropic substances, precursors and other types of crime

● The Agreement of the Government of the Member States of the Commonwealth of Independent States on the exchange of information in the field of combating crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the French Republic on cooperation in combating crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the Italian Republic on cooperation in combating organized crime, illicit trafficking of narcotic drugs, psychotropic substances, precursors and chemicals used for their manufacturing, terrorism and other types of crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the Republic of Estonia on cooperation in combating organized crime and other types of crime

● The Agreement between the Government of the Republic of Kazakhstan and the Government of the Kingdom of Spain on cooperation in combating crime

● The Agreement on cooperation between the General Prosecutor's Office of the Republic of Kazakhstan and the General Prosecutor's Office of the Republic of Belarus

Domestic Legislation

● The concept of legal policy of the Republic of Kazakhstan for the forthcoming period

● The Presidents of the Republic of Kazakhstan Plan of the Nation “100 concrete steps on the implementation of the five institutional reforms” (launched on May 20, 2015)

● “On the Prevention of Offenses” Law of the Republic of Kazakhstan

Historically the aforementioned were preceded by following conceptual and strategic documents:

● State program of legal reform

● The concept of legal policy

● On the State program of the first-order measures for combating crime and strengthening the status of law and order in the Republic of Kazakhstan for 1993-1995

● On the State program of the Republic of Kazakhstan for combating crime for 1997-1998; and the reference direction of law enforcement activities up to the year 2000

● On the program of combating crime in the Republic of Kazakhstan for 2000-2002

● On the program of crime prevention and fight against crime in the Republic of Kazakhstan for 2003-2004

● On the program of crime prevention and fight against crime in the Republic of Kazakhstan for 2005-2008

● On the field program of the offenses prevention in the Republic of Kazakhstan for 2011 - 2013

Law-Enforcement Practice

● Statistical data analysis on the state of crime related to trafficking in human beings for 2010-2012; and 11 months of 2013.

● The brief on judicial practice in criminal cases related to trafficking in human beings for 2013 and 2014 (stipulated by articles 125, part 3, paragraph “b”; 126 p. 3 “b”; 128, 132-1, 133, 270, 271 CC).

● The brief on the provision of the rights of victims in cases of human trafficking (based on the criminal cases reviewed in 2014-2015) on the legislation enforcement that establishes responsibility for trafficking in human beings.

Discussion

Traditionally, the fundamental criterion for distinguishing sub-systems of criminal policy is the existence of independent branches of law and legislation. Therefore, it seems logical that, according to L.D. Gaukhman, and S.V. Maksimova: “The subsystems include the criminal law, criminally-remedial and penal enforcement policies. These subsystems correspond to independent branches of legislation - criminal, criminally-remedial and penal, each of which, having its own subject and method, performs its specific tasks in the field of combating crime” [14, p. 57; p. 575].

In this reference, the following statement by V.S. Dzhatiev is truly eloquent: “Criminology is not tied to any particular branch of law; therefore, it is not customary in Russian legal doctrine to speak about the criminological policy of the state. I consider this restraint to be erroneous and even harmful, since it does not stimulate the state to perceive and implement the recommendations of criminologists. Without examining in depth the issues of the criminological policy of the state, I, nevertheless, have long been determined in a principled approach to assessing its essence. At the same time, I cannot name any special scientific publication devoted to this issue” [15, P. 33-34].

I.N. Kondrat expressing the similar position, when he considers as basic the six-element (legal, processual, preventive, penal, investigative and organizational) structure of the criminal policy by A.I. Aleksandrov [16, p. 99]; and emphasizes that “if we turn to the two final elements of the criminal policy - criminal preventive policy and criminal-organizational policy - we have to state that they are perhaps developed surprisingly weaker than others” [17, p.160].

G.R. Rustemova does not share such skepticism arguing that “criminological politics as an integral part of the criminal policy as a whole has found its place in criminological science” [18, p.19].

The idea of Russian and domestic criminologists about preserving the discussion of the issue of criminological legislation and its legal nature in the context of correlation with criminological policy (which is also called preventive or precautionary), has not lost its relevance.

Among domestic researchers B.Zh. Zhunusov is one of the first who turned to this problem at the doctoral dissertation level, and in the context of the relevant monograph noted the following: “It seems theoretically and practically justified to proceed from the fact that there is a single criminal policy - a policy in the field of combating crime with the help of criminal law measures - and its subspecies (subsystems, constituent parts): criminal law, criminal processual, penal and criminological policies” [19, p. 42]. The significance of this monograph is difficult to overestimate, however, from the moment it was published it took almost 12 years, and therefore, a number of provisions require a rethinking in accordance with the changed realities and the implemented and planned political and legal reforms. As known, a number of updated anti-criminal codes were adopted on the platform of the next concept of the country's legal policy. Continuous update of law enforcement reform within the framework of the triune modernization of politics, economy, and public consciousness that began in 2017 is still being implemented. Throughout recent history, it has been essentially important to study the best practices of the states of the near and far abroad. And of particular importance among them is Russia, with which centuries-old ties are established, which is reflected in the formation and evolution of the political and legal system, including some certain continuity. In this reference, a comparative legal method is put forward. A Coryphaeus of domestic criminology - U.S. Dzhekebaev emphasizes: “When developing, adopting and issuing legislative acts, it is desirable to focus on the Model Criminal Code for the CIS countries; it will be inevitable to study the legislative experience of Russia and other foreign states” [20, p. 42]. This idea is also holds truth in the problem of combating crime related to trafficking in persons. As it is known, the CIS Inter-parliamentary Assembly has developed model laws in this area, but not all of them are accepted by post-Soviet countries, including the Republic of Kazakhstan. In this reference, other saying of the aforementioned scientist's warning about the omissions of the 1994 reform is quite relevant: “One of the reasons for the incomplete implementation of the program of judicial and legal reform in the life of society was the insufficient development and application of the experience of social and legal reform conducted by others developed in solving similar problems” [21, p. 4].

Today, in the context of developing an optimal model of crime prevention policy, including in the area of trafficking, it is important first of all to have a clear understanding of its structure.

So, the outstanding criminologist E.F. Pobegailo as components, branches, subsystems of a single policy in the area of combating crime, distinguishes: criminal-law (narrowly defined as criminal), criminal-processual (procedural), criminal-executive (penal) policy, criminological (preventive) and legal-administrative policy [22, P. 9-10]. N.A. Lopashenko writes in his monograph: "Within the framework of the state policy in the field of combating crime, it is possible to allocate a criminal-law (criminal), criminal-procedural, criminal-executive (penitentiary) and criminological policies" [23, p. 22]. E.V. Kobzeva notes that "in criminal law, in the broadest sense of the word, only such constituent elements as (again, in different variations) criminal-law, criminal procedural, criminal-executive (penitentiary), criminological (preventive) versions of policies should be included" [24, p. 82]. Yu.I. Bytko believes that "... a policy called criminal in the broad sense, it is advisable to define as a policy to counteract crime. Within the framework of this policy, it is necessary to distinguish the following types: criminal (policy in the area of criminal law rulemaking), criminal law enforcement (policy in the area of criminal legislation application by courts), criminal executive (policy in the area of court convictions execution), and criminological (in the areas of resocialization of persons who have served criminal penalties; and other measures for the prevention of crimes)" [25, p.147]. According to L.I. Belyaeva the criminal policy "... includes: a) prevention, i.e. preventive policies, sometimes it is called criminological; b) criminal law policy; c) criminal procedural policy; d) operational search policy; e) criminal-executive policy" [26, p. 24]. V.A. Blinnikov proposes a six-element structure of criminal policy, which consists, as he calls, from the following trends: criminal law, criminal executive, criminal procedure, criminalistics, criminological and law enforcement [27, p. 29].

I.V. Shalakhin states that "whereas, the policy of restricting and preventing crime ... includes criminal policy, as a nucleus, a core element that determines the state's line with regard to active offensive influence on crime" [28, p. 87].

Thus, it can be noted that such elements (subsystems) of criminal policy as criminal law, criminal procedure, and criminal executive are most often singled out by scientists. The least frequent in the relevant literature (including challengeable one) are criminalistics, legal-administrative, operational-search, criminal-organizational, judicial and law enforcement policies. In addition, the reason for the discussion is the correlation between criminal-law and criminological, between criminological and victimological; and criminal procedural and operational-search policies.

In this regard, the opinion of I.M. Kleymenov is quite convincing, stating that "criminological policy is included in the content of the criminal policy - insofar as the prevention of crimes is connected with state coercion" [29, p. 96]. In all fairness, it should be said that Kleimenov distinctly declares independence of criminological policy in regard to criminal. Moreover, he is convinced that "criminal policy is part of the criminological one because the latter also relies on social policy" [30, 55]. A similar opinion showed by V.A. Shunyaeva, who, in particular, notes that criminological policy "is rooted in criminal policy", and then transformed "into an independent direction of state policy, which is based on criminological ideas on the implementation of the criminological security concept " [31, p.177]. In Kazakh science, T.K. Akimzhanov also considers: "the very concept of criminological politics appears most general in relation to such categories as criminal, criminal-executive, criminal procedural and other policies, since by semantic meaning it contains an indication of scientifically grounded activity on crime counteraction, development and implementation of measures on crime prevention, which is also covered by the subject area of criminology" [32, 54]. In the foreign criminology, the issues of criminological politics are given attention in correlation with the productivity of criminological research. In this regard, let us cite a number of interesting judgments on this subject by scientists from different countries of the world published by very authoritative scientific journals. Just note that in many respects they have similar views.

So, Alfred Blumstein writes: "There should be a natural symbiosis between the research process and the policy process. Research should be directed at issues that concern policy-makers, and policy-makers should want to seek guidance from research findings in order to attain more effective and efficient policies. This is certainly an appropriate and important ideal relationship. It is widely seen in technological areas, it is the norm in other social sciences such as economics, and one would hope that would be the case in criminology" (Alfred Blumstein. Interaction of Criminological Research and Public Policy//Journal of Quantitative Criminology, 1994 – Springer, December 1994, Volume 12, Issue 4, P. 349–361) p. 349.

Leslie Sebba notes that "The question arises, however, as to whether and to what extent there is any connection between the policy reforms and the research. This question arises, of course, in other areas of criminological policy—as, indeed, in other areas of social policy" (Leslie Sebba. On the relationship between criminological research and policy: the case of crime victims// Criminology and criminal justice. Vol. 1, issue 1, P. 27-58, issue published on February 1, 2001 https://doi.org/10.1177/1466802501001001003) p. 27.

Kevin D. Haggerty emphasizes that "The long-standing relationship between criminal justice policy and the advice of criminologists has been ruptured in the past two decades" (Kevin D. Haggerty. Displaced Expertise Three Constraints on the Policy relevance of Criminological Thought //Theoretical Criminology. Vol. 8, issue 2, P. 211-231, issue published on May 1, 2004, https://doi.org/10.1177/1362480604042244 & Criminal Justice).

David F. Greenberg is concerned that "ever since criminology became a distinct discipline, criminologists have hoped to promote the adoption of what they have considered to be rational, effective methods for dealing with crime" (David F. Greenberg. Criminological research and crime control policy: not a marriage made in heaven//Criminology & public policy. Vol. 5, issue 2, P. 203-212, issue published on May, 2006, DOI: 10.1111/j.1745-9133.2006.00374.x) p. 203.

As will be noted below, in domestic science, as well as in foreign science, there are common problematic issues of optimal interaction between criminological theory and criminological politics.

In any case, behind all this there are challenging questions of localization, purpose and interactions of these versions of policies, their legislative tools and fundamental foundations. The mostly relevant appears the study of the correlation and productive interaction of criminology, criminal law and criminal politology.

In this regard, as noted by I.A. Zinchenko and A.Yu. Trapitsyn, the basis of the concept of criminal policy should be a clear criminological idea, citing the following quote as an argument: "The criminal law policy is criminological, - writes M. M. Babaev, - and criminological policy is a normative. And that contains a pledge and a condition of effectiveness for each of them" [33, P. 87-88]. Over the years, Babaev, as such an idea offers the concept of criminological security. By the way, in Kazakhstan, at the level of a doctoral dissertation V.V. Root developed this idea, making it fundamental.

Generally, as it was rightly noted by A. G. Bezverkhov, today "the methodology and methodic of criminal law, political and criminological research is also different" [34, p. 33], and, therefore, it does not contribute to their rapprochement, not to mention the development of joint products. Whereas, A.I. Boyko writes that "with regard to the current unsatisfactory situation with the crime counteraction, the reproach should be addressed to representatives of criminal law and criminology, who often does not locate the general subject of their research" [35, p. 37]. After all, as Y. V. Golik quite accurately remarked, "in recent years there has been a certain gap between criminology and criminal law. Development (if it can be called development) of criminal law went without any connection with criminological research, and in criminology a whole direction emerged, defending its right to understand what is criminal and what is not. Such positions, being brought to the extreme, cannot help improve the situation in the fight against crime" [36, 53]. Further, he calls for the consolidation of the efforts of specialists. V. A. Nomokonov shares the same opinion, when rightly points out that "the development of the criminal law and criminological science of our country naturally led to the conclusion that it is necessary to provide them with a closer interconnection, even a certain integration, in the framework of a broader theory, concept, paradigm" [37, p. 196]. As such, it is worthy to present the theory of criminology of the law and criminology of criminal law (justice). We are entirely agree on that with S. F. Milyukov, that "we must do everything possible to complete the formation of this branch of scientific knowledge and the legislative implementation of the ideas of Russian and foreign criminologists, tested by life, as soon as possible" [38, 52].

In this regard, there is mention-worthy statement by M. M. Babaev and Yu. E. Pudovochkina that "the first step in this direction can be the development of a roadmap for the integration of criminal law and criminology, the definition of those key points of their contact, which should be paid the closest attention in the organization and conduct of scientific research" [39, p. 41].

According to B.Zh. Zhunusov, "criminological policy can be designated as the direction of the state activities to eliminate causes and develop measures to prevent crime" [40, P. 36-37].

A similar interpretation can be found in works by G. Rustemova, who believes that the criminological policy "is first and foremost activity of the state in eliminating the factors of committing crimes and implementing measures on crime prevention" [41, p. 19].

Criminological or preventive policy is a policy in the area of crime prevention, encompassing norm-setting, defining the direction and ways of implementing criminological prevention of antisocial phenomena, as well as the direction of practical implementation of preventive activities; and management of this practice. Criminological policy is the closest thing to what is called a strategy to combat crime. It is well-known, that prevention is the most effective remedy to counteract criminal manifestations [42, p. 10]

The most profound researcher of this phenomenon M.P.Kleimenov gives the following broad definition: "Criminological policy is scientifically grounded policy, consistent with international standards and legislative requirements, purposeful and systematic activity of state and municipal bodies, political institutions, business entities, public organizations, religious associations and citizens in reducing crime and decriminalizing public relations by social and legal means, provision of vital personal interests, society and the state from internal and external threats" [43, p. 225].

He argues about two models of criminological politics known in history - totalitarian and liberal, each of which is characterized by 16 attributes.

However, as the author believes, none of the models is optimal, since both do not meet the requirements (criteria) he put forward, a number of which, to a certain extent, are similar to those that are characteristic of the liberal one. The latter takes place in transit societies and states.

Criteria of the optimal criminological policy by M.P. Kleimenov [44, P. 229-231] are as follows:

1. Correspondence of national ideology, as a synthesis of traditional national values of the country;
2. Increase of the spiritual and moral potential of society; implementation of cultural and moral policies in the direction of humanistic personal qualities education;
3. Attention priority to the crime prevention;
4. Severance of business and government by excluding the participation of civil servants in entrepreneurial activities, as well as of businessmen "bearing the same representation" in government;
5. Elimination of all legal immunities, with exception of diplomatic immunity;
6. Establishment of procedures for the public certification of certain categories officials with the participation of community leaders;
7. Formation of a curtain structure for revision of the property status and sources of income of state officials and employees of governmental organizations and institutions regardless of the form of ownership; as well as the compliance of their expenditures with legal income;
8. Strengthening of the state response and regulation of the economy;
9. Improvement of state social policy, elimination of unemployment, indigence and poverty; restoration of labor resources;
10. Reduction of alcohol and narcotics consumption;
11. Strengthening of the family values;
12. Protection of children from all kinds of exploitation, physical or psychological abuse, corruption and depravation;
13. Maintenance of the state of publicity and scientific character at legislative acts preparation;
14. Introduction of the institute of criminological expertise of normative legal acts;
15. Integrated utilization of all legal means (criminal law, administrative law, civil law, etc.) for the purpose of combating crime;
16. Correction of strains in the human resources policy in federal, regional and municipal authorities, law enforcement and judicial bodies; exclusion of corruptive practices of cronyism and nepotism;
17. Optimization of processes of criminalization and decriminalization;
18. General social responsibilities of business;
19. Further development of criminological legislation;
20. Protection of potential and rehabilitation of real victims of crime;

21. Education in the law;
22. Improvement of criminological management;
23. Decriminalization of regions, branches of economy and fields of activity;
24) International engagement and cooperation in the detection, suppression and prevention of crimes.

According to V. A. Blinnikov, the goal of the criminological policy is to develop effective ways to identify the causes and prevention of crimes that will allow keeping crime at a level appropriate to the objective capabilities of society to oppose it.

The author believes that the objectives of this policy line are: “to formulate and disseminate ideas about the real nature, causes and state of crime, to develop the foundations, approaches and methods of studying crime, its causes, the identity of the offender, and to determine crime prevention measures, forms of development and methods of management of crime prevention subjects (state authorities and administrations, educational and other institutions and establishments) with a view of a resolution for opposing tasks of counteracting crime” [45, p. 33].

With reference to our topic, the Commission on Human Rights under the President of the Republic of Kazakhstan rightly noted: “One of the key elements in successful prevention of trafficking in persons is effective legislation. In recent years, Kazakhstan has taken a number of steps in this area” [46, p. 86]. This is very relevant in the view of the globalization of crime, especially the organized one, which many scholars are paying attention to. Among other relevant aspects, criminologist Ya. I. Gilinsky refers to “... the globalization of organized crime (drug trafficking, human trafficking, etc.)” [47, p. 93].

Relying on the latest developments of scientists (in particular, by D. A. Shestakov and M. P. Kleimenova) this document definitely can be attributed to criminological legislation. Author is convinced that such an industry exists at the time and is actively developing as a “system of international, federal and regional normative legal acts of criminological content and criminological orientation”, and whoever ignores this fact - does nothing for national security [48, p.183]. In this regard, the following idea by Shestakov gained practical importance: “The definition of the content and the boundaries of the criminological legislation, the formulation of the question of its incorporation, which has already begun, have made it possible to make a preliminary outline of its structure. The author of these notes identified groups of criminological norms established by legal acts on: 1) strategies for combating crime, 2) criminological expertise, 3) countering specific types of crime, and 4) having a victimological orientation” [49, p. 326].

Conclusion

In foreign criminology, as the analysis has shown, the issues of criminological policy are more developed, although there are problems of further modernization and optimization of the interaction between theory and practice.

In the domestic legal system, and first of all in the legal doctrine, it is still necessary to conduct a large-scale and complex activity on the design of the criminological policy model.

In this regard, along with the best foreign experience, as a fundamental theoretical and methodological basis for criminological policy in the field of combating crime, including those related to trafficking, it is necessary to select the following developments:

1) *M. M. Babaev, A. G. Bezverkhov, A. I. Boyko, Yu. V. Golik, I. M. Matskevich, V. A. Nomokonov, Yu. E. Pudovochkin* and other authors of the materials of the 10th Russian Congress of Criminal Law on the theme "Criminological Foundations of Criminal Law" (May 26-27 of 2016, Moscow State University);

2) *M. P. Kleimenov* on the essence (scientific validity, compliance with international standards and national legislation, systematic and purposefulness in reducing crime and decriminalization of the society, ensuring criminological security), criteria for optimality (24 indicators), topical areas (crime prevention, improvement of legislation, optimization of law enforcement activities, criminological management, the international cooperation);

3) *D. A. Shestakov, M.P. Kleimenov, S. F. Milyukov and D.Yu. Goncharova* on criminology of the law, criminology of criminal law (justice), criminological law, the system of legislation on combating crime;

4) *O. N. Vedernikova, A. G. Kibalnik and I. M. Kleimenov* on comparative criminology and international criminal law, legal and criminological systems;

5) *A. B. Bekmagambetov* on criminological and criminal law systematization of acts related to trafficking in persons (the first key aspect) [50, P. 209-218]; and the structure of the policy of counteraction (the second key aspect) [51, P. 34-39; 763-772].

Constitutional reforms in Kazakhstan: real parliamentarism or a means to preserve political stability?

Makartsev A.A.
Novosibirsk State University of Economics and Management,
Novosibirsk State Technical University

Abstract

The purpose of the article is to analyze the content of the constitutional reform carried out in the Republic of Kazakhstan in early 2017. In the author's opinion, the changes introduced into the basic law of the Republic of Kazakhstan reflect the general tendency of the former post-Soviet countries, in which a formal increase in the elements of parliamentarism takes place through the expansion of powers of national legislative bodies. The article illustrates this by the example of amendments made to the basic laws of the post-Soviet countries in the first decade of this century.

The methodological basis of the research is the dialectical approach to the cognition of legal phenomena, allowing to analyze the process of their functioning in the context of the objective aggregate and subjective factors, as well as the postmodern paradigm, which makes it possible to research the legal reality at various levels.

The central place in the constitutional reform was occupied by the redistribution of powers between the supreme bodies of state power in favor of increasing the parliamentarism elements. The competence of the parliament was significantly expanded by reducing the scope of authority of the head of state. The author claims that the uncertainty of the provisions of the basic laws of the post-Soviet countries, adopted in the 1990s, regarding the definition of the type of the republic, was related to the preservation of the maximum possible choice of the way for the further development of young political systems. At the same time, it should be noted that when introducing various models of government in the process of constitutional changes, the main mistake was made, which consisted in fixing only the formal, external properties of the democratic system and did not provide for those substantive and internal opportunities that actually determined the main purpose of the separation of power.

The author concludes that the results of the constitutional reform that took place in Kazakhstan in early 2017 can only be seen after several years. This is confirmed by an analysis of changes introduced in late 2008 to the Constitution of the Russian Federation. Constitutional reform, increasing the role of the government, formed by the parliament and accountable to it, ultimately should increase the role of the political component of parliament, and increase the democracy of the national electoral system. But its effectiveness will be largely determined by the goals that the highest state power wants to achieve: a real democratization of life or another populist reform of the administration system.

Keywords: Constitution, constitutionalmodernization, parliament, executive power, constitutional reform, form of
government

Introduction

Modern parliaments are an integral part of the system of multi-level government, which involves the joint solution of strategic tasks by various public authorities, the expansion of the circle of actors involved in the development and adoption of political and legal decisions. If previously representative institutions were monopoly spokesmen for public interests, nowadays civil society institutions and social networks are successfully competing with them. In this regard, in modern democracies there is a tendency to weaken the position of parliament in the system of higher public authority bodies. The most important political and legal decisions are increasingly taken without its participation, which is due to reasons both objective and subjective. The development of integration processes, the formation of international and supranational centers of lawmaking (the World Trade Organization, the European Union, the Eurasian Economic Community), universal and regional structures that develop norms and standards, etc.) limit the capacity of national parliaments to implement independent lawmaking [5, p. 48].

Against the background of this process in many countries of the post-Soviet space in the 21st century, there is an increase in the elements of parliamentarism through the expansion of the powers of national legislatures. From a formal point of view, the reform of the public administration system in the post-Soviet countries reflects the trend of expanding parliamentary system that has been realized over the past decades and which has been designated as the "renaissance of parliamentarism" [20, p. 4]. It is this that demonstrates the emergence, in connection with the integration with Europe, of a supranational, international parliament - the European Parliament.

The process of expanding the powers of parliament began at the end of the 20th century and is the fourth stage in the development of the world parliamentarism. During the first stage (the 14th-18th centuries), the parliament was formed as a state authority. The second stage (the end of the XIII- early XX centuries) is called the golden age of parliamentarism. In the legal literature of that time it was noted that "electivity creates a close moral connection between the parliament and people and is the source of the political power of representation" [15, p. 182]. The formation of the parliament at that time took place on the basis of censored electoral law, which enshrined the interests of the emerging bourgeoisie.

The third stage (1920s-1960s) Is characterized by the fact that the parliament gives way to the dominant role in the political life of the executive power. The reason for this was the limited social base of existing parliaments, since 10-15% of the country's population participated in their elections. Parliaments either turn into decorative, non-influential bodies in countries with a totalitarian regime, becoming a cover for the dictatorship of the party and its leader, or were suppressed by the executive in democratic states. Among politicians and scientists there is a new view on the role of parliament in the life of the state and society. For example, the English professor Robert Yewdall Jennings wrote that the task of parliament is not in the leadership of the country, but in influencing and controlling the activities of the government. The French sociologist Raymond Aron noted that the parliament should be retained in order to create an average person's conviction that the government does not rule the country uncontrollably and serves as a screen for covering up the work of the national government [27, p. 440-441]. In connection with the emergence of an electoral system based on universal, equal, direct submission of votes, since the 1960s begins a new stage in the development of parliamentarism, which consists in its revival.

Materials. The methodological basis of the research is the dialectical approach to the cognition of legal phenomena, allowing to analyze the process of their functioning in the context of the objective and subjective factors aggregate, as well as the postmodern paradigm, which makes it possible to research the legal reality at various levels. Special attention is paid to a comparative analysis of the provisions of the basic laws of a number of CIS countries.

In 2004, on the initiative of L. Kuchma, the Constitution of Ukraine was amended to weaken the presidential power, which in 2010 President V. Yanukovich unsuccessfully tried to abolish [19]. In December 2016 citizens of Kyrgyzstan voted for amendments to the Constitution, significantly expanding the powers of parliament and government. These amendments should have entered into force in December 2017.

Any reform of public authority, associated with a certain stage in the development of statehood, is aimed at removing the contradictions existing therein. At each stage of the dialectical development of the system, it is required to isolate the basic social contradictions that determine its forward movement, to predict their deployment and the possibility of growing into social conflicts, to develop and implement state measures that promote a certain (for a given stage of the dialectic contradiction) stability of the social system [25, p. 7].

Quite often, the initiative of carrying out constitutional reforms appears during the periods of the change of the head of state. This can be demonstrated by the example of Uzbekistan. President of Uzbekistan Sh.M. Mirziyoyev spoke in his inauguration speech on December 14, 2016 about the need for a dialogue between the authorities and the population and the expansion of the role of the deputy corps of the national parliament. Until September 2, 2016 this post was occupied by Islam Abduganievich Karimov, who from 1989 to 1991 was the first secretary of the Central Committee of the Communist Party of Uzbekistan, and in 1990 headed the government of the country. On August 31, 1991 Uzbekistan declared independence and officially withdrew from the USSR. On December 29, 1991, I.A. Karimov was elected as the president of the country. After his death on September 2, 2016, by joint decision of the Legislative Chamber and the Senate of the Supreme Assembly (Oliy Majlis) of the Republic of Uzbekistan, the duties of the President were temporarily assigned to the Prime Minister of Uzbekistan Shavkat Miromonovich Mirziyoyev, who first headed the government in 2003 on October 19, 2016 at the VIII meeting of the Movement of businessmen and business people - the Liberal Democratic Party of Uzbekistan, Sh.M. Mirziyoyev was nominated as a candidate for the presidency of the Republic of Uzbekistan, and easily won the elections on December, 14. As a result, in Uzbekistan there was a transfer of power to a new head of state.

Results. In the Republic of Kazakhstan, the constitutional reform of 2017 was the next stage in the implementation of the policy of the head of state. On December 15, 2016, at a solemn meeting dedicated to the twenty-fifth anniversary of Kazakhstan's independence, President Nursultan Nazarbayev voiced the idea of the need for a constitutional reform, one of the tasks of which is the redistribution of powers between the branches of power. On January 26, 2017, it was announced about a general discussion prepared by the Constitutional Commission, amendments to the Constitution of Kazakhstan[1].

The practice of discussing draft basic laws is a tradition for post-Soviet states. Its foundation was laid back in the first half of the 20th century, when the Constitution (Basic Law) of the USSR was adopted in 1936. The Stalinist leadership, with the aim of legitimizing it in the eyes of ordinary Soviet citizens, initiated a procedure for general discussion of the draft regulatory legal act, in which, according to official figures, at least 75 million people, or about 80% of the adult population of the country participated [12, p. 125]. At present, these figures are very difficult to verify. S.A. Avakyan notes that the figures quoted in the studies are more arbitrary and cannot be verified "at that time, and later, the official did not spare colors, drawing a picture of approval, general joy and constructive discussion of the draft Constitution" [1, p. 67]. The result of a nationwide discussion of the draft Constitution of the USSR was that most Soviet citizens are sure that the adoption of the Basic Law took place with their participation. But, noting the positive consequences of the constitutional reforms of the 1930s (discussion of the draft Basic Law, direct elections of deputies to the Supreme Soviet of the USSR), it should be emphasized that the Soviet leadership did not set the goal of creating a real opportunity for citizens to participate in the process of making publicly-authoritative decisions. Elements of the discussion were used during the campaign for the Constitution of the Russian Federation in 1993, which began after the publication of its draft[2].

The draft Constitution of the Republic of Kazakhstan was also subjected to a nationwide discussion. It was held from June 30 to July 30, 1995. During the national discussion in more than half, namely, 55 articles, 1100 amendments and additions were made. According to Kazakhstan jurists, when developing and adopting the current Constitution, a new format was applied. Preparation of the project was carried out by a narrow group of legal experts, headed by N.A. Nazarbayev. Then the composition of developers was expanded at cost of new professional lawyers. The main provisions were presented to the participants of the Assembly of People of Kazakhstan and supported by them. Then followed a very intense discussion by the citizens of the country, work on the registration of proposals and direct approval of the document by the people in the course of a direct expression of will in a referendum. Thus, due to the format "President proposed, and the people of Kazakhstan adopted a new Constitution", the document was strictly scientific; including the consolidation of universally recognized values, taking into account Kazakhstan traditions, determining the scope, subject and methods of constitutional regulation of specific groups of relations, exhaustive regulation of the fundamental rights and freedoms of human and citizen; an optimal form of government was elected, in the context of the principle of unity and separation of state power, it is clear for everyone that the provisions and norms are set out. The quality of the document largely became the principal guarantee of the subsequent for the supremacy and direct action of the Basic Law, fulfillment of the

[2]Rossiyskaya Gazeta dated November 10, 1993.

role of the basis for improving the entire legal system of the country, and the conscious constitutionally-lawful behavior of participants in constitutional and legal relations [16, 34, 35].

Discussion of amendments to the Constitution of the Republic of Kazakhstan marked the beginning of a new constitutional reform, promised by the effective head of state as early as 2015, during his election campaign[1]. For three months, during which there was a discussion of amendments to the Constitution of the Republic of Kazakhstan, about six thousand proposals were received. A rather short period of discussion determined a small number of proposed changes. During the discussion of the draft basic law in 1995, almost thirty thousand proposals and comments were made to the draft. At the same time, as experts say, this happened in an era when the main means of communication were paper letters, not Internet services[2]. The relatively small number of changes proposed during the discussion demonstrates it, to some extent, a formal character.

The reform touched a quarter of articles of the Constitution of Kazakhstan. The chairman of the Joint Commission for drafting the draft law "On Amendments and Additions to the Constitution of the Republic of Kazakhstan" for the second reading, the Majilis deputy Nurlan Abdirov noted that initially the draft submitted by the head of state provided for 26 amendments to 19 out of 98 articles of the Constitution. The final version of the Law contained 33 amendments to 25 articles of the Constitution[3]. According to the general rule, fixed art. 90 of the Constitution of the Republic of Kazakhstan, the procedure for amending the Constitution is a republican referendum. In connection with the need to speed up the procedure for amending the Constitution of Kazakhstan, the President, using the powers given to him, proposed to introduce amendments through the adoption of a law on amendments and additions by the parliament. The law adopted by the Majilis was signed by the head of state on March 10, 2017[4].

The main directions of the constitutional reform in Kazakhstan in 2017 were defined back in 2007, when the powers of the Parliament were expanded, which was given the right to agree and finalize the candidacy of the Prime Minister; the role of political parties in forming the legislative body increased; influence of local representative bodies strengthened. The Senate was entitled to issue laws during the temporary absence of the Majilis, caused by the early termination of its powers. In addition to legislative functions, the upper chamber of parliament, in addition to legislative functions, began to participate directly in the personnel policy of the state by giving consent to the appointment by the President of the head of the National Bank, the Prosecutor General, the chairman of the National Security Committee, the election of the chairman and judges of the Supreme Court, participating in the formation of the Constitutional Council, the Commission, the Accounts Committee for Control over the Execution of the Republican Budget. In fact, these changes laid the foundation for possible further democratic construction in the country, in the political system of which the elements of authoritarianism were rather vividly manifested [36, 37].

The central place in the constitutional reform of 2017 was occupied by the redistribution of powers between the supreme bodies of state power in favor of increasing the elements of parliamentarism. The competence of the parliament was significantly expanded by reducing the scope of authority of the head of state. For example, the head of state lost the right to issue decrees having the force of law, his right to legislative initiative was limited, etc. The Constitution of the Republic of Kazakhstan introduced provisions strengthening the positions of local self-government bodies, independence of the judiciary.

[4]Law of the Republic of Kazakhstan dated March 10, 2017 No. 51-VI LRK "On Amendments and Additions to the Constitution of the Republic of Kazakhstan" // Official website of the President of the Republic of Kazakhstan // http://www.akorda.kz/ru/official_documents/constitution

Despite the fact that significant changes were made to the system for realizing the powers of the supreme bodies of state power, the amendments did not affect the provisions of Art. 2 of the Constitution of the Republic of Kazakhstan, which fixes the presidential republic as a form of government. Development of this position finds in Art. 40 of the Constitution of the Republic of Kazakhstan, which determines the place of the President in the system of public authorities, instituting it as the head of state and the highest official.

Kazakhstan scientists note that the common features of the presidential republic, which, with some modification, found reflection in the Constitution of the Republic of Kazakhstan, justified themselves. So, after the self-dissolution of the Supreme Council of the Republic of Kazakhstan of the XII convocation and the temporary delegation of certain powers of the legislature to the President, he quickly and at a high enough quality level adopted hundreds of decrees on important issues of state life that have the force of constitutional laws and laws of the land. This showed the presidential capacity and capabilities in the field of lawmaking and was of great importance in strengthening the presidential system of government [21, p. 98].

It should be noted that the definition in the main law of the type or character of the republic[1] for the countries of the former USSR is the exception (Republic of Kazakhstan, Republic of Tajikistan) rather than the rule. The majority of states are limited to the statement of the republican form of government (Georgia, Kyrgyz Republic, Uzbekistan, etc.). Uncertainty of the provisions of the basic laws of the post-Soviet countries regarding the definition of the type of the republic adopted in the 1990s was associated with the preservation of the maximum possible choice of the way for the further development of young political systems. At the same time, it should be noted that when introducing various models of government in the process of constitutional changes, the main mistake was made: only formal, external properties were introduced and the content and internal opportunities that really determine the main purpose of the separation of power are not stipulated. the hands of one subject and each branch of government must restrain and balance the other. The conclusion reached with regard to Georgia's legal system can be extended to these countries: "The main problem of the Georgian Constitution, created by dozens of changes, is a system malfunction in the power delimitation model, an impractical, superficial deterrence-balancing mechanism that does not really ensure the balance of political power" [7, p. 81].

It is too early to speak about the effectiveness of reforming the system of state power in Kazakhstan. The transformation of the social order, according to Joseph Schumpeter, is a continuous process, but very slow [30, p. 530]. In this regard, not one year will pass, when its results will be revealed, and it will be possible to answer the question about the coincidence of the goals announced at the beginning of the reform and the goals achieved at its completion. Such a conclusion can be made by analyzing the consequences in the political life of Russia, which were achieved following the introduction of changes made in the December 2008 in the Constitution of the Russian Federation.

On December 30, 2008, the President of the Russian Federation signed the Laws of the Russian Federation on amendments to the Constitution of the Russian Federation concerning changes in the terms of the powers of the head of the Russian state and the State Duma[2], and the control powers of the State Duma with respect to the Government of the Russian Federation[3]. The laws on changing the terms of the powers of the highest state bodies bore a general character that specified for Russian legislation. Of particular importance was the Law conferring control over the State Duma of the Federal Assembly of the Russian Federation in relation to the Government of the Russian Federation. In accordance with it, the State Duma

---

[1]The term "system of government" is also used in the literature to characterize the republic's type. N.A. Sakharov notes that "it is more correct from the point of scientific terminology to talk about the presidential, semi-presidential, parliamentary system of government." See: The Presidency Institute in the Modern World. M .: Yurid. lit., 1994. P. 3.

[2]Law of the Russian Federation on the amendment to the Constitution of the Russian Federation dated December 30, 2008 N 6-FCL "On changing the term of office of the President of the Russian Federation and the State Duma" // Rossiyskaya Gazeta. N 267. 2008. 31 Dec.

[3]Law of the Russian Federation on the amendment to the Constitution of the Russian Federation dated December 30, 2008 N 6-FCL "On Ruling Powers of the State Duma in Relation to the Government of the Russian Federation" // Rossiyskaya Gazeta. N 267. 2008. 31 Dec.

has the right to consider the annual reports of the Government of the Russian Federation on the results of its activities.

Due to the fact that unlike the Republic of Kazakhstan, the Constitution of the Russian Federation, while fixing the republican form of government, does not determine the type or character of the republic, there is no single point of view on this issue among scientists. In the late 1990s, Professor M. Ganino of the University of Milan wrote that in the Russian government there are 50% of the elements that belong to the French model, 30% are from the US model, 20% come from the imperial tradition. Voicing his opinion, M. Ganino noted that the Russian form of government "is not connected with Western models, it is an independent and original model, because it assumes new forms of state structure and completely new forms of separation of powers" [6, 110].

A similar position is expressed by the majority of Russian jurists. Professors M.I. Kukushkin and A.N. Kokotov note that an analysis of the provisions of the Russian Constitution allows us to conclude that there is a mixed republic in Russia [13, p. 106]. The combination of the parliamentary and presidential republics is characterized by the Russian government and other authors [3, p.123; 13, p. 152]. The mixed character of the Russian republic is most clearly manifested in the most important sign that determines the form of the republic: the procedure for the formation of a supreme executive body [26, p. 272; 4, p. 332]. In the appointment of the Chairman of the Government of the Russian Federation, according to Art. Art. 111 of the Constitution, the head of state and parliament takes part. Although, as noted in the literature, it is the President of the Russian Federation who has a significant influence on the process of forming the Government of Russia [11, p. 73], and the influence of the State Duma is rather limited [18, p. 136].

Another important feature of the mixed republic is dualism of executive power, which consists in the simultaneous existence of a head of state, endowed with certain powers of the executive, and the chairman of the government. In accordance with Art. 32 of the Federal Constitutional Law dated December 17, 1997, No. 2-FKZ "On the Government of the Russian Federation", the President of Russia directs the activities of federal executive bodies responsible for defense, security, internal affairs, justice, foreign affairs, emergency prevention and disaster management etc.

The consolidation in the Constitution of the Russian Federation of compulsory reporting by the supreme executive body to the State Duma increased the elements of parliamentarism, made them more pronounced in the Russian form of government and, in fact, placed the Government accountable to the President of the Russian Federation in the background.

An analysis of constitutional norms and federal legislation allows us to conclude that there is a mixed republic in Russia, which, after making amendments to the Constitution of the Russian Federation in 2008, began to be inclined toward a parliamentary one. The government was formed by the head of state and the parliament, but formally the supreme executive body is accountable to the State Duma. For the further active development of the parliamentary republic, it was necessary in the future to link the institution of government accountability to the State Duma with the possibility of expressing its distrust.

The consolidation of the mandatory reporting of the supreme executive body to the State Duma in the Constitution of the Russian Federation increased the elements of parliamentarism, made them more pronounced in the Russian form of government and, in fact, placed the Government accountable to the President of the Russian Federation in the background. Securing the elements of a parliamentary republic in the constitutional system of Russia was not a novel in law-making policy. The beginning of approbation of elements of this form of government in Russia at the level of the subjects of the Federation can be considered the adoption of the Federal Law of December 11, 2004 No. 159-FL "On Amendments to the Federal Law" On the General Principles of the Organization of Legislative (Representative) and Executive Bodies of State Power of the Subjects of the Russian Federation "and the Federal Law "On Basic Guarantees of Electoral Rights and the Right to Participate in the Referendum of Citizens of the Russian Federation ", which abolished direct elections of the heads of executive power subjects of the Russian Federation. The Russian citizen was given the powers of the highest official of the subject of the Russian Federation on the proposal of the President of the Russian Federation by the legislative (representative) body of state power of the subject of the Russian Federation. If the constitution (charter) of a constituent entity of the Russian Federation provided for a bicameral legislative (representative) public authority, the decision to confer on the citizen of the Russian Federation the powers of the highest official of the subject (the head of the highest executive body of state power of a constituent entity of the Russian Federation) is adopted at a joint session of the chambers. Despite the fact that the legislator used the notion of "empowerment" in this case, in fact, when the position of the head of executive power of a constituent entity of the Russian Federation was filled, the institute of multi-stage elections was applied: the highest official of the subject of the Russian Federation was elected by deputies of the legislative (representative) body of the constituent entity of the Federation. The nominee in this case was proposed by the President of the Russian Federation.

The waiver of the procedure for empowerment occurred in 2012, with the adoption of Federal Law No. 40-FL dated May 2, 2012 "On Amendments to the Federal Law "On General Principles for the Organization of Legislative (Representative) and Executive Bodies of State Power in the Subjects of the Russian Federation " and the Federal Law "On Basic Guarantees of Electoral Rights and the Right to Participate in the Referendum of Citizens of the Russian Federation", which enshrined direct elections of the heads of constituent entities of the Russian Federation. In accordance with the Federal Law No. 30-FL dated April 2, 2013 “On Amending Certain Legislative Acts of the Russian Federation”, the alternative to direct elections of the head of the Russian regions was the model of multi-stage elections: subjects of the Russian Federation in their constitutions (charters) may provide for the possibility of election the highest official of the subject of the Russian Federation (the head of the highest executive body of state power of the subject of the Russian Federation) deputies of the legislative (representative) body of state authority of the Russian Federation.

In the context of the development of elements of parliamentarism in Russia, the amendment concerning the increase in the term of office of the head of state looked more adequate. In most countries with this form of government, the term of office of the head of state is more than four years. For example, in accordance with art. 60 of the Constitution of Italy, the Chamber of Deputies and the Senate are elected for five years. The extension of the term of office of the head of the Russian state and the discrepancy between the electoral cycles of the State Duma and the President of the Russian Federation would only help the latter to fulfill the functions of a political arbiter in the system of supreme bodies of state power. This can be more in line with the essence of the current Russian Constitution, which was laid by its authors. S. Shakhrai, who is one of them, repeatedly noted that the President of the Russian Federation, according to their plan, had to have "sleeping" powers, to be a political arbiter who had to use his powers only in difficult situations [29, p. 7].

Since the introduction of these amendments to the Constitution of the Russian Federation, which were the first for it, almost ten years have passed. Despite the expansion of the powers of the State Duma of the Russian Federation, there has been no increase in parliamentarism in real political life. In the scientific literature it is recognized that the positions of the Federal Assembly in the system of power, indicated by the norms of the Constitution, are still noticeably weaker than those of the head of state. The most serious restriction of the autonomy of the Russian parliament was the creation of a virtually one-party system, under the control of which there was both the entire "power vertical" and any of the horizontal slices of public power in Russia. While this hierarchically organized political force retains its influence, legal instruments aimed at limiting the executive and "presidential" branches of power will not be needed for the Federal Assembly [23, p. 43].

The control powers of the State Duma, stemming from the annual obligation of the Government of the Russian Federation to report to it, have not developed properly. The reports of the Government have not yet become "a socially and politically significant event in the life of the country" [28, p. 119]. The weakness of this legal institution is due to the lack of legal consequences of the reports. In fact, certain information is brought to the notice of parliamentarians, which does not oblige or induce them to anything [9, p. 25]. The low effectiveness of the institutions of parliamentary responsibility of the Government of the Russian Federation minimizes it in the system of separation of powers, and the model of "strong head of state" remains the basis of the Russian form of government.

In this context, the position of a number of authors who believe that in the content of constitutional reforms in many modern states, in which democratic institutions began to develop in the 1990s, is fair, there is a deep tension between the obligations to democracy and the procedures for amending the constitution.

Often amendments are adopted that follow formal democratic procedures but are aimed at achieving anti-democratic or "offensive" constitutional goals, that is, to help current presidents extend their term of office, remove parliamentary or federal scrutiny from the executive branch and limit or suspend basic human rights. [33, R. 606-607]. The scientific discussion is ongoing, which is still going on about the approach to be followed in constitutional matters, in order to prevent unlimited discretionary judgments [17, p. 14].

Drawing parallels between constitutional reforms in Russia and Kazakhstan, it can be concluded that an analysis of the changes that have been made to the Constitution of the Republic of Kazakhstan shows that, without formally changing the form of government, they laid the foundation for the transition to a mixed republic. As the political practice of Russia shows, it is with the mixed republic, unlike other types of republics, that the model of a strong head of state receives maximum development. In modern legal science, the elements of this form of government in the new democracies have been called "semi-representationalism." It can be considered fair that the constitutional model quickly imported by these new democracies is neither American-style presidential... nor a limited parliamentary model.... Rather semi-representationalism - an underestimated constitutional type, which is most often associated with the French Fifth Republic - is rapidly gaining momentum. This constitutional type unites the popularly elected head of state with the head of government who is responsible to the popularly elected legislature, which makes the theory conceptually and analytically different from the other two basic constitutional types that exist in the modern world. After the collapse of the communist regime, semi-presidential candidates were chosen by many post-Soviet countries. It is reflected in the constitutions of Belarus, Croatia, Poland, Romania, Russia and Ukraine. In the 1990's this constitutional type was perceived in many countries of Africa and Asia and even some Latin American states [31, p. 93-94].

The new version of the Constitution of the Republic of Kazakhstan consolidates the participation of the parliament in the formation of the government, which is one of the defining features of the parliamentary or mixed republics. In accordance with art. 65 of the Constitution, the Prime Minister makes proposals on the structure and composition of the Government only after consultation with the Majilis. The exception are the ministers of defense and foreign affairs, who are appointed by the head of state independently, that is, parliamentary influence does not extend to the sphere of foreign policy and the power block.

The construction of a system of dualism of the executive power is aimed at singling out of the competence of the head of state the powers related to the management of the socio-economic sphere and referring them to the competence of the Government. In accordance with art. 44 of the Constitution, the competence of the President remained the main issues of defense, foreign policy, public administration, the protection of the Constitution and ensuring effective work between the branches of power. The implementation of the constitutional reform has led to the fact that the Government, taking the necessary decisions within the framework of a certain policy of the Head of State, bears full responsibility for the state of affairs in the socio-economic sphere. In fact, it turns out that there are two officials in the state, empowered by the highest executive power: the President and the Prime Minister.

The development of parliamentarism confirms the expansion of the responsibility of the Government and the entire system of the executive branch of power, their accountability to the Parliament, the inclusion of the latter in the process of dismissing ministers from office. So, following the results of hearing the report of a member of the Government by a majority of at least two-thirds of the total number of chamber deputies, each of the chambers has the right to receive an appeal to the President on the release of this official in the event of his failure to comply with the laws. In this case, the President dismisses a member of the Government. The guarantee of the institute of parliamentary responsibility is the exclusion from the Basic Law of the provisions providing for the right of the President to reject the appeal of the deputies of the Chamber to dismiss a member of the Government, that is, the relevant appeal of the Chamber to the Head of State for the release of a particular member of the Government is subject to adoption.

Guaranteeing mechanisms for the implementation of the vote of no confidence in the members of the supreme executive body is a further development of the institution of parliamentary control, which, according to Kazakhstan scientists, has been actively used in recent years. Procedures related to the implementation by the chambers of the control function of the Parliament of the Republics include the consent of the Senate for the appointment by the President of the Republic of the Chairman of the National Bank, the Prosecutor General, the Chairman of the National Security Committee of the Republic, etc. [24, 91].

The constitutional status of the parliament was substantially adjusted. In the old version of the Constitution, the Parliament was formalized as a representative body exercising legislative functions. In the current version, its functions were clarified: the Parliament of the Republic of Kazakhstan is the highest representative body of the Republic exercising legislative power. The absence of a new version of the Constitution of Kazakhstan of the president's right to issue decrees having the force of law, as well as delegating legislative powers to the president, is aimed at guaranteeing the legislative powers of the parliament. Such authority was granted to the Head of State by the Supreme Council of the Republic of Kazakhstan in 1993. During the validity of the relevant law in 1995-1996, the President adopted more than 130 decrees, which had the force of constitutional and customary laws. These decrees formed the legal basis for a new state building, facilitated the launch of market reforms[1].

In this context, the increase in the powers of the legislative branch is a positive moment, excluding the President's right to declare the consideration of the draft law urgent. This right has already been repeatedly criticized by the parliamentarians, as it did not always allow for a comprehensive study and comprehension of the relevant draft laws. The changes introduced increased the responsibility of Parliament for the adoption of qualitative laws. At the same time, the head of state retained the right to determine the priority of passing bills in the Parliament.

Discussion. The emergence of significant powers of the parliament in relation to the government entails the need to reform the party system in Kazakhstan, which has common features with Russia. Electoral legislation and legislation on political parties contributed to the formation in both states of a multi-party system with one dominant party – *Yedinaya Rossiya* in the Russian Federation and *Nur Otan* in the Republic of Kazakhstan. The process of unification of various political parties was conditioned by the exclusion from the electoral legislation of these countries of the legal norms permitting the creation of electoral blocs. In the mid-2000's in both states a proportional electoral system was established as the basis for elections of one of the chambers of national parliaments. In the State Duma of the fifth and sixth convocations, the political party *Yedinaya Rossiya* had the majority of seats - 315 and 238, respectively. In the State Duma of the seventh convocation, which was already formed on the basis of the Federal Law dated February 22, 2014 No. 20-FL "On Elections of Deputies of the State Duma of the Federal Assembly of the Russian Federation", which consolidates the mixed electoral system, *Yedinaya Rossiya*, headed by the Chairman of the Government of the Russian Federation, has 343 seats from 450 places (76.2%) [14, p. 945]. Currently, the party "Nur Otan" occupies 84 of 107 seats in the lower house of parliament (Majilis) (78.5%), its chairman is N.A. Nazarbayev himself.

President of the American Political Science Association Edwin Korvin said in the first half of the 20th century that the constitution "is not the cause, but the consequence of civil and political freedoms; it grants rights to the people, but it is the creation of its power itself"[32, p. 69-70]. Projecting this point of view on the problem under consideration, one can state the opinion that the democratic nature of the constitutional legislation can not always ensure the existence of a democratic regime. Moreover, as noted in the literature, the authority of post-Soviet parliamentarism is gradually falling due to the formalization of representation. The post-Soviet parliamentary system operates by ignoring the very essence of constitutionalism, which is its integral part [2, p. 133].

Conclusion. Constitutional reform that took place in Kazakhstan increasing the role of the government, formed by the parliament and accountable to it, ultimately should increase the role of the political component of the parliament, and increase the democracy of the national electoral system. But its effectiveness will be largely determined by the goals that the highest state power wants to achieve: a real democratization of life or another populist reform of the system of state administration. It is rightly asserted that even repeated national elections conducted in conditions of voluntary participation and providing citizens with unlimited opportunities to receive information can justify specific decisions that the winners

[1]http://www.inform.kz/ru/konstitucionnaya-reforma-potrebuet-ot-politpartiy-modernizacii-kasym-zhomart-tokaev_a2995755

will take in the future[1]. In modern times, there are many examples of how an authoritarian system was replaced by a plebiscite system, associated with democracy, but degenerating into despotism and tyranny of one kind or another[2]. Under conditions of real political competition, the parliament of Kazakhstan can become a full-fledged representative body, supported by broad social strata. The head of state, while formally remaining the head of the executive power, actually gradually goes beyond the separation of powers, implements strategic fictions, transferring most of the powers to the government, acting as the supreme arbiter in relations between the branches of power.

Abstract

This article examines official documents and letters of leaders of various organizations of Russia sent directly to the Russian Imperial Political Agency (Political Agency), which was established on the territory of the Bukhara Emirate. Correspondence between different departments is analyzed, on the basis of those documents that are currently stored in Tashkent, in the Central State Archive of the Republic of Uzbekistan (CSARU).

It is emphasized that all relations between the Bukhara Emirate with the Russian Empire and the Turkestan governor-general went through the correspondence of a diplomatic representative. By the decree of Tsar Alexander III in Bukhara, in the beginning of 1885, a Russian representative office was established - the Russian Imperial Political Agency, headed by a political agent appointed by the Ministry of Foreign Affairs and subordinated to the Turkestan Governor-General and, consequently, the Military Ministry and the Ministry foreign affairs. The Agency was entrusted with the relations with the Bukhara government on all the most important issues in the sphere of politics, economy, science, security, etc. Attention is drawn to the fact that Russian advisers were assigned as the "political agents" to control the ruler of the Bukhara emirate, and in foreign policy Bukhara was completely dependent on Petersburg.

It is noted that the political agency was supposed to exercise control over the emir and his ministers regarding all issues that affected their relations with Russia. Historical sources of that period note that the Russian scientific societies are preliminary. the first stage of their research was carried out on the territory of the Turkestan Governor General, and in the second stage, as archival documents show, Central Asia studies were conducted directly in the territories of the Bukhara Emirate and the Khiva Khanate, rich in natural and material wealth, which at that time were particularly attractive for those gaining weight Russian merchants.

Keywords: Russian imperial political agency,Bukhara emirate,emir, kushbegi, letters.

Introduction

At the beginning of the XIX century. on the territory of Central Asia, there were three independent states in the person of Khiva, Kokand khanates, and also the strongest of them Bukhara emirate. This region, not yet sufficiently studied, attracted the attention not only of neighboring states, but also was in the sphere of geopolitical interests of the world's largest powers, and Russia, which showed interest in the Central Asian region, trying to establish economic relations with it, and, most importantly, to study the possibility of its subsequent conquest and development. Since the second half of the XIX century. the situation began to change dramatically because of the British Empire's desire to get ahead of Russia and penetrate the region through the territory of India and Afghanistan. Rivalry with England has become one of the reasons for the activation of Russian foreign policy towards the countries of Central Asia. The confrontation between the two empires was called the "Great Game". Particularly close interest of the Russian Empire to the region of Central Asia in the X1X century. is explained by a number of important factors, among which is the development of capitalist relations, which encouraged the conquest of new territories that would become a source of raw materials, as well as a market for the sale of industrial products. In addition, by this time, the import of cotton from North America to the Russian Empire was reduced due to the civil war in the United States in 1861-1865, which led to a crisis in the rapidly growing cotton industry in Russia. In addition, the khans of Central Asia imposed customs duties on Russian merchants, which forced them to turn to intermediaries in the face of Kazan and Ufa merchants. For the above reasons, a note was sent to the Ministry of Foreign Affairs, which indicated the need to create favorable conditions for the Russian merchants in the khanates. These ideas were supported by influential publications, a number of newspapers and magazines in Russia.

In the second half of the XIX century. the relationship between the Russian Empire and the Bukhara Emirate is formed on the basis of two treaties of June 23, 1868 and under the agreement of September 24, 1873, concluded in Shakhrisabs. According to the agreement concluded in 1868, the upper reaches of the river. Zarafshan, together with the Samarkand and Kattakurgan lands, retreated to Russia; Emir was charged with paying the Russian Empire an indemnity, and now Russian subjects were given the opportunity to have a caravan-saray in the emirate, acquire real estate and conduct unimpeded trade. The Treaty of 1873 consisted of 18 articles, in which much echoed with the treaty of 1868, but nevertheless in the new treaty there were a number of major innovations. So, according to the 15th article, the Bukhara Emirate was allowed to have its permanent representative in Tashkent, who was supposed to live there at the expense of the emir and in the Emir's house. According to Article 16 of the treaty, the tsarist government was to have its political representative in Bukhara.

In a word, the imperial Russian center has an ever-growing interest in the region and, along with the strengthening of the activities of the tsarist diplomats, an extensive study of the state of Central Asia began, including involving representatives of the scientific community. So, with the establishment of vassal dependence on the Russian Empire, the process of comprehensive study of the Bukhara emirate was activated. Scientists had to solve specific tasks for the development of the territory and natural resources of the emirate, exploring geology, geography, soil, flora and fauna, etc.

In the XIX century. Bukhara Emirate was the largest centralized state and occupied quite a large territory, the emirate's border ran along the territory of Iran, Khiva Khanate and Kazakh zhuzes with a total area of more than 200 thousand square meters. km. The center of the Bukhara emirate was the Zarafshan valley with such large cities as Samarkand, Bukhara, Penjikent, Ura-Tube, Karshi, etc. People of different nationality lived in Bukhara: Uzbeks, Tajiks, Kazakhs, Kyrgyz, Turkmens, Karakalpaks, Jews, Persians, Arabs, Gypsies. The national majority of Uzbeks-1.5 million people.[1]

From 1800 to 1836, three Russian embassies arrived in Bukhara. Bukhara Emirate, in turn, only from 1836 to 1843 equipped three embassies in Russia for talks with the tsarist government on expanding Russian-Bukhara trade ties. Both sides - both Russia and Bukhara were interested in maintaining and expanding embassy and trade relations. From Bukhara, cotton, silk, paints, dried fruit, dressing gowns were exported to Russia, and ready-made factory products were imported in large quantities from Russia to Bukhara. Armenia Vamberi wrote that in Bukhara there is not a single house, not a single tent, where there would be no Russian product[2].

Thus, for the above reasons, the Bukhara emirate, which is not part of the Turkestan governor general, is one of the most important priorities of the policy pursued toward the eastern states by the Russian Empire at the end of the 19th and beginning of the 20th century. The Central Asian region is at the center of attention of scientific societies and individual Russian scientists with the task of mastering information about minerals and natural resources of the territory, as well as finding opportunities to use them in the interests of the Russian state. The imperial government used not only the military, but also scientific societies and their members who carried out all-round active activities within the Emirate of Bukhara to carry out the tasks set.

Methodology

The methodological basis of the research was made up of dialectical methods of scientific cognition. During the writing of the article, special methods of scientific cognition were used: the study and analysis of documents, synthesis, analogy and comparison, the unity of theory and practice, the need to take into account the general and special in the classification of archival documents. Historical and comparative legal methods are widely used. In the course of the study, the historical process of expanding the Russian Empire was considered, including the states of Central Asia, in particular the Bukhara Emirate, the interaction of

[1] Tukhtametov T.G. Russian-Bukharian relations in the late XIX-early XX centuries. Tashkent. 1966. P.14
[2]Vamberi A. Journey through Central Asia. M., 1865. C.213.

institutions of power on both sides, ensuring its normal functioning. In order to identify the most effective and effective provisions of the topic studied, a large number of individual scientific publications and other works were studied and analyzed. Investigation of the most important sources revealing the activities of various expeditions aimed at comprehensively studying the Bukhara emirate at the end of the 19th and beginning of the 20th century, in particular the official diplomatic correspondence of that time, is the purpose of this article.

Among the many sources, a special place is occupied by the correspondence of representatives of the Russian Imperial Political Agency in Bukhara with the government of the emirate.

As evidence of this, the following arguments can be cited:

1.In the correspondence, the attitude of the leaders of the government of the Bukhara Emirate and the Russian Imperial Political Agency;

2.This correspondence collected primary information about the purposes for which the Russian scientific societies and individual researchers conducted a study of the territory of the Bukhara Emirate;

3. Correspondence provides an opportunity for in-depth research and understanding of those aspects of events that are not registered in other sources of that period.

Results

The study of the documents of the Russian Imperial Political Agency in the Bukhara Emirate in detail demonstrates that the activities of representatives of the Russian scientific community in the territory of the emirate are mainly connected with the collection of information in such areas as ethnography, study of archaeological and historical monuments, local studies, research in zoology, and geodetic observations.

As a result of studying the archival documents of the Turkestan Governor General, the Russian Imperial Political Agency and the kushbegi emirate, kept in the Central State Archives of the Republic of Uzbekistan, it became known that for each expedition held in the territory of the emirate, correspondence was conducted between the official agencies of the administration of the Russian Empire and the government of Bukhara the emirate.

Along with this, it was found out that the official letters selected in the process of research, according to the significance of the issues discussed in them, can be divided into two groups. The first group can include letters addressed to official representatives (Turkestan Governor General and Russian Imperial Political Agency) for conducting activities in the territory of the Bukhara Emirate, and the second group consists of correspondence between representatives of the Russian Imperial Political Agency and the government of the Bukhara Emirate.

The letters of the first group on content consist mainly of letters about the organization of expeditions of scientists, sending them to the corresponding region and assisting them in this. But the main task related to the performance of expeditions is reflected in the correspondence between the kushbegs of the Bukhara Emirate and the Political Agency of the Russian Empire. Because this correspondence is important, in the sense that it includes the peculiar approaches of the expedition, the attitude of the government of the emirate to this event and contains detailed information on obtaining an official permit.

Among the documents of the Russian political agency and the office of the emirate's kushbegi, there is no complete collection of letters on the planned and some conducted studies on the territory of the emirate. There is no correspondence, all institutions related to any expedition. It mainly includes letters from organizations that sent expeditions, letters sent to the Turkestan Governor-General or the Political Agency.

But even in this case, letters are of exceptional importance. Because they contain brief, but very valuable information about societies and scientists who have explored this territory. This information will help us to make a base (chronicle) of historical information about the date and purpose of expeditions. During the research, both types of letters were studied in detail.

Studying the historical informative value of letters gave us the opportunity to find out that as a result of correspondence between the Russian political agency and the government of the emirate, under the auspices of the Imperial Russian Geographical Society, the Russian Imperial Archaeological Society, the Russian Imperial Academy of Arts, the Russian Entomological Society, the Russian Committee for the Study of the Middle and Eastern Asia in historical, archaeological, linguistic and ethnographic respects, based on St. Their activities were conducted by societies organized in scientific and educational centers.

At the same time, the branches of these societies and organizations, for example, such territorial branches as the Turkestan branch of the Imperial Russian Geographical Society[1], Turkestan circle of lovers of archeology[2], Bukhara branch of the Society of Oriental Studies[3], Military-topographical department of the Turkestan Military District[4], Turkestan Public Library and Museum[5] took an active part in the implementation of this activity.

Secondly, based on the study of correspondence, we were able to identify the names of researchers and scientists who were pioneers, and as representatives of the above organizations conducted research in various scientific directions in the territory of the emirate.

Discussion

Letters between the Russian political agency and the government of Bukhara on the activities in the territory of the Bukhara emirate.

In preparing the correspondence in the Russian Imperial Political Agency, a general order was introduced, in particular: first, on the organization of the expedition and the permission of the scientific community to conduct it, the chairman of the society informed the government officials about all this in advance. In many cases, the management of the company put similar questions in official letters sent to the first department at the Ministry of Foreign Affairs and to the Turkestan Governor-General;[6] Secondly, after the reception by the Chancellery of the Turkestan Governor-General letters about the assistance of the expedition of the scientific society, officials proceeded to resolve this issue. If the objectives of the expedition affected the territory of the emirate, the administration of the office appealed to the Russian political agency in Bukhara through letters; Thirdly, the most important aspects of the organization of the expedition's activity on the territory of the emirate were reflected in the correspondence between the kushbegs of the Bukhara Emirate and the Russian political agency. Since the tasks of organizing the expedition in the above cases were usually solved at the internal level. The decision on issues related to the implementation of the activities of the expedition, usually found its solution in the third group of letters of correspondence. It was thanks to the letters of this group that it was possible to make changes and additions to the plan of the expedition. Correspondence of this kind is of great importance in covering the history of scientific research carried out in the territory of the emirate.

The analysis made during the study of the correspondence that was conducted between the Russian Imperial Political Agency and the government of the emirate shows that visits to the territory of the Bukhara Emirate by representatives of the Russian scientific community were conducted in accordance with a certain order.

The event was carried out on the basis of bilateral correspondence. The instructions sent to the Political Agency by the lower officials and societies of the Russian Empire served as the basis for a written appeal of the political agent to the government of the emirate. Such a document is recorded as a prior written request in mutual correspondence. The same method of writing such letters is observed in almost all letters. With regard to the content of letters, they can see the appeal of the Political Agency to the emirate with a request to issue permission for conducting scientific activities to a representative of a society or members of an expedition in the territory of the emirate, granting permission (an open sheet) in their name, and issuing instructions to local officials. As an example, letter No. 3684 of June 7, 1912, sent by political

[5] CSA RU. Form I-3, op.1, d.374, sh.67.

[6] In the process of analyzing archival documents of the Political Agency, in addition to this type of appeals, letters of heads of organizations sent directly to the political agency were preserved.

agent A. Somov to the name of kushbegi Mirza Nasrullabiya: "Dear kushbegi Mirza Nasrullabiy. The Russian entomological society informed me that at the end of June this year Kirichenko Alexander Nikolayevich, representative of this society, will be sent to Babatag and Termez for the purpose of entomological research, near the eastern territories of Bukhara[1]. Notifying you of the above, Mr kushbegi ask you to instruct him on the provision of comprehensive care and let me know about it. I wish you the health and mercy of His Holiness Emir, I await your response. Political agent: signature (A. Somov)[2] ."

From the letters sent back to the political agent sent to the emirate's kushbegi, the government of the Bukhara Emirate assisted the expedition members in the following areas. First, issuing permission (open sheet) to conduct research on the territory of the emirate, secondly, fixing special people behind them, thirdly, distributing instructions about the expedition to the corresponding behemoths of the emir, fourthly, proceeding from the goals and objectives of the scientists or expedition, material encouragement of their activities.

Among the documents of correspondence, the resolutions approved by the seal of the Bukhara emirate's kushbeg for the conduct of research in the territory of the emirate are of particular importance. When studying the history of the relationship between Russia and Bukhara, a correspondence of this kind, dating back to the end of the 19th century. beginning of the XX century., insufficiently investigated. Proceeding from this, we considered it necessary, within the scope of our topic, to consider, in essence, the content of the permits of the kushbegi. This type of document is the primary source in covering the history of research in the territory of the Bukhara Emirate. The open sheet contained, as the permission of the government of the emirate, the provision for carrying out the activities of the expedition, was an accompanying document ensuring the safety of the members of the expedition, and also assigned a special official to the members of the expedition. Here is an example: "Beks and officials of the Bukhara khanate (emirate), know that on the orders of his Holiness the Emir and at the request of the Russian political agency in Bukhara, and also on the orders of the Turkestan governor-general, the Russian official Popov on January 5, 1899, e. On the 5th day of the month Ramadan through Karshi will arrive in Kerki. By order of His Holiness the Emir to provide during the journey to Captain Popov help, Nasriddin the woman has been assigned to him. All the beks in the territory of the Bukhara Khanate must provide all-round assistance to Captain Popov. (On the 29th day of the month Shaban 1316 (December 30, 1898), Bukhara kushbegi, Zhon Mirzaby Divanbegi)"[3]. This document was written in the office of the kushbegi in Persian and was written in Arabic script, and was also approved by the seal of the kushbegi. The document was delivered to the Political Agency through an official assigned to scientists or an expedition that visited the territory of the emirate for research purposes. He was sent as an attachment to the letter kushbegi addressed to the political agent. Through this exchange of documents, representatives of the Political Agency received information about the attitude of the government of the emirate to the implementation of an expedition, permission to conduct it, and also about the official assigned to it. Thus, scientific societies and local officials received information about the response letter of the kushbeg and its application[4].

During its subsequent activities, the Political Agency provided its document in the form of a permit addressed to an official of the emirate assigned to members of the expedition[5]. To start the expedition, the permit (open sheet) issued by the government of the emirate and the certificates provided by the agency were delivered to members of the expedition through an emirate official. Thus, according to the analysis of archival documents, the practical significance of the agency's permits was not higher than an open letter of instruction given out by the emirate's kushbegi and providing permission to conduct activities in its governing region, as well as giving the opportunity to receive appropriate

[1] This means letter No. 75 of June 7, 1912, sent to the name of political agent A. Somov, the head of the society. See: CSA RU. Form I-3, op.1, d. 74, sh.10.

[2] CSA RU. Form I-126, op.2, d.850, sh.10.

[3] CSA RU. Form I-3, op.1, d.9, sh.240.

[4]CSA RU. Form I-3, op.1, d.52, sh.62-,94.

[5] CSA RU. Form I-3, op.2, d.96, sh.421.

assistance on this issue from the beks of this region . Because the certificate provided by the Political Agency consisted of written notes about the attitude of the government of the emirate to their studies and about who the official assigned to persons visiting the territory of the emirate is. The certificate was intended for passage through the Russian settlement and for representatives of institutions in the territory of the emirate and was used only as a reference. Usually the document in the agency was not issued in the form of a certificate, but in the form of a certificate.

One of the agency's certificates was provided by B.A. Fedchenko, said: "This certificate under No. 4198 was provided by the Russian Imperial Political Agency in Bukhara to Fedchenko Boris Alexeevich, the chief botanist of the Imperial St. Petersburg Botanical Gardens, to carry out the task assigned to him on the territory of the Bukhara Emirate. (Signature-stamp)"[1].

On this issue, in the correspondence that was conducted between the Kushbegi and the Russian political agency in May-June 1913, one can learn about the issuance by the government of the emirate of a permit (open sheet) for the activities of the scientist and that Yusufbek was attached to him to conduct this activity world of zabazi. After that, the Political Agency also provided its identity card to the official. Certificate №4199. It was granted to the Bukharan official Yusufbek Mirzabashi, who was appointed to help and accompany the chief botanist of the Imperial St. Petersburg Botanical Garden Fedchenko Boris Alekseevich to carry out the task entrusted to him. (Signature-stamp)"[2].

Usually documents of this kind were signed by a political agent or an agency manager and confirmed by the agency's seal. In the Political Agency, serial numbers were put in the certificates, after which they were given to the appropriate persons. This can be traced to the certificate No. 1785[3], registered in the name of Yodgorbek Mirzabashi - a local official directly assigned to Ya.S. Edelstein and his companion D.I. Mushketov, who arrived in the territory of the emirate for conducting geological observations. Certificate №5691[4], issued in the name of Khongeldibek Mirzabashi, assigned to help the artist PP. Fetisov, who in 1913 arrived to collect information about ancient monuments of art, architecture and ethnography.

Based on the letters of the kushbegi of the Bukhara Emirate sent to the name of the Political Agency, it can be concluded that the government of the emirate almost always assigned its people to scientists or expeditions exploring its territory. The majority of such responsible persons are officials who work in the office of the kushbegi, who work in positions of Mirzabash, jubilee, caravulbeg and mirahura.[5]

The question of fixing the expedition or scientists officials was reflected in a letter kushbegi emirate, sent to the name of a political agent. "You asked me for the appointment of an official to help you for a scientific trip to the regions of Darvaz, Roshan and Shugnan, for a member of the Imperial Geographic Society, and geologist Ivanov. I appointed Astana Mirzabashi. I inform you that I gave him an open letter to the officials of the emirate, which indicated the provision of all-round assistance and unhindered passage of him and the scientist in the specified territories. The 9th day of the month of Muharram, 1313 AH (May 28, 1897), the attitude to the letter No. 2067 - (*it must be understood as a response letter.*)"[6].

[5]Mirzabashi is a person holding a position in the emirate's management system. Performed the duties of the manager of the affairs of the office. He was considered an official equal to the rank of sergeant-major in the Russian Empire. The dwellers are both a palace and military official. He was considered an official equal to the rank of second lieutenant in the Russian Empire. Karavulbegi - the chief of the guards and guards. He was a responsible person for peace and tranquility in the state. He was considered an official equal to the rank of lieutenant in the Russian Empire. Mirakhur - a person in this position, at first was responsible for delivering food (straw, hay, grain) to Emir horses. He was considered an official equal to the rank of captain in the Russian Empire. See: Khanykov N. Description of the Bukhara Khanate.Saint Petersburg, type. The Imperial Academy of Sciences, 1843-P.185.

[6]CSA RU. Form I-3, op.1, d.9, sh.26.

In the process of studying the correspondence, it was found out that the government of the emirate at various times worked and participated in activities related to the work of scientists in the study of the territory of the emirate of Mirzabashi Khongeldibek, Kurbonbek, Yadgarbek and Jurabek, Astan, Yusufbek and Abdulhamid, Mirza Nasriddin Haji, Abdukadir and Saidbek zhivachi, the caravulbags Mirza Said, Umarkul, Khoja Jurabek and Muhammadkul, as well as the mirahurs Muhammadbek, Juma Mirza, Bobobek[1].

Proceeding from the above, it can be stated that the kushbegi, when choosing officials for these positions, adhered to the established, certain requirements, for example, most of the above officials were persons with military ranks and were in the service in the emirate management system. This circumstance, on the one hand, ensured the safety and success of the expeditions carried out in the emirate's backyard, on the other hand, when it became known that scientists in their studies were beyond the scope of the tasks and goals, it enabled the assigned officials to take any measures in this direction or urgently report this kushbegi emirate. It is worth noting that the person involved in the affairs of Mirzabashi's office was a very educated man. This person was engaged in gathering information about who the members of the expedition met and what they were talking about, what are their true goals and objectives. The main objective of the people belonging to these two groups was that issues of national importance were excluded from the process of communication between the local population and members of the expedition. To ensure this, they used various means to be permanent witnesses during conversations with representatives of the local population, using certain circumstances, making changes to the expedition route and not accompanying the researchers to regions that were not recommended for visiting.

As a result of a study of written sources of that time it was found out that in the Kushbegi office, 15 specially selected people were on duty to carry out activities to meet representatives of Russian scientific societies, accompany them and carry out the activities necessary for them[2]. On the subject of the meeting of high-ranking personalities visiting the country, carried out selection among officials. Such an event was organized in the office of the Kushbegi, proceeding from the goals and scope of the scientist-researcher. Proceeding from the directions of the expedition, in letters addressed to the Kushbegi by the Political Agency, it was noted that the researchers assigned to A.P. Mikhailov and Ya.S. Edelstein Mirzabashi Kurbonbek and Honlegeldi began to carry out their tasks in the regions of Garm[3] и Karatog[4].

Summing up, it can be noted that a complex of researched letters shows that the government of the Bukhara Emirate not only fixed scientists for the scientists, but also gave appropriate instructions to the beks in the regions. Letters sent to kushbeg beks can be divided into two groups. The archival documents of the agency revealed the existence of letters related to these two groups. The first group of them includes letters for beks with instructions on expeditions with certain areas of research and their purposes, the second group of letters consists of instructions for assisting the expedition during the passage of certain directions of the territory of the emirate[5]. If the first group includes the letters almost all expeditions have been made at the emirate, the second group includes the letters on expeditions whose main aim was to study the Central Asian and neighboring countries with it.

In written appeals sent by the emirate's kushbegi to the name of the beks, it was revealed that there were indications containing instructions for rendering assistance to representatives of the Russian Empire

planning a passage through the territory of the Bukhara emirate. After sending such instructions, he informed the Political Agency about this. This can be seen in the example of the next letter. "His Highness the Governor of the Russian Imperial Political Agency in Bukhara. We, according to your letter No. 3019 of May 17, 1913, sent a written order to all the kazis in Karshi, Chardjou, Kulyab, Balzhuvan, Darvoz, Karateghin, Gissar, Dehna, Baysun, Sherabad, Kalif, Kerky, Burdalik, Chirakchi, Guzar, Yakkabagh and Kitab, on providing comprehensive assistance to Lepou Roma Lambertovich during his stay in the territory of the emirate. " (The 13th day of the month of Shawwal, 1331 AH (August 31, 1913))[1].

The practical significance of these instructions can be traced to the example of the activities of persons involved in the research of BA. Fedchenko, N.V. Bogoyavlevsky, A.A. Bobrinsky, L.A. Zimin. They are Khizh-Nazar and Mulla Nozim brothers living in the village of Shigil, not far from Garm, or the representative of the Varkut-Amanbek kishlak, as well as local government officials Eshmuhammad Mirzo, Muhammad and Yusuf Alishah.

Correspondence of representatives of the Political Agency and the Government of Bukhara on material support of scientific expeditions.

Another of the most important issues noted in the correspondence of the Political Agency is the issue of material support for the activities of the expedition by high-ranking officials of the government of the emirate. For example, the Bukhara Emir supported materially the group of expeditions and scientific events of the Turkestan branch of the Imperial Geographical Society, as well as the State Administration of Property and Agriculture in the Turkestan Territory, which conducted research in the territory of the emirate.

In the series of significant expeditions, which received material assistance from the Emir of Bukhara, one can also make expeditions to AP. Mikhailov (1897) and B.A. Fedchenko (1916) In order to support the activities of these scientists, the issue of allocating funds was mainly reflected in the correspondence of the emirate's kushbeg with the Political Agency. For example, the question of allocating the means of the expedition to A.P. Mikhailova, was previously decided in the regional institutions of the Russian Empire. This can be seen from a letter of April 25, 1897, sent by the Vice-President of the Imperial Geographical Society, P.P. Semyonov to him Baron A.B. Vrevsky[2] in which the engineer of the Turkestan mountain district asks him to assist him in organizing the expedition.

Baron A. Vrevsky[3] in his reply of May 20, 1897, sent to the vice-president of the Imperial Geographic Society, P.P. Semenov on this issue sets out the following: "Due to lack of funds in the Turkestan branch of the geographical society for the organization of the expedition, AP. Mikhailova, I turned to Emir of Bukhara. Mr. Emir for the organization of the expedition and during the work on the hiring of labor allocated funds of 1500 rubles. I think that, given the generosity of the Emir and taking into account the rendering of great assistance to the expeditions of the Imperial Geographical Society, sent to the territory of the Bukhara Emirate, you will find it worthy to receive honorary members of the society of Mr. Emir"[4].

Expedition of the engineer of the Turkestan mountain district A.P. Mikhailova, in 1895, studied the content of gold particles in the sand in the territory of Balzhuvan and Darvaz. In 1897, the Bukhara Emir for the organization of a second expedition aimed at studying minerals on the territory of Shugnan and Roshan, allocated to the Turkestan branch of the Imperial Geographical Society through the State Bank of Bukhara region money of 1500 rubles[5]. On this issue in May-August 1897, extensive correspondence was conducted

[5]CSA RU. Form I-3, op.1, d.9, sh.29.

between the emirate's kushbags and the Russian political agency. In the Emir Abdul Ahadhan was elected an honorary member of the society[1].

At the final stage of the expedition on October 27, 1897, A.P. Mikhailov, sent a letter to V.I. Ignatyev. He was informed that he had met with the Turkestan governor-general and asked the latter to deliver the precious stones found to Emir as a result of the research. But the Governor-General answered him that it would be better if he personally met Emir Bukhara and himself presented him with these stones[2].

The tradition of supporting the Bukhara emir of studies that are of great importance for the economic and social life of the emirate can also be traced in the work of B.A. Fedchenko - the chief botanist of the Botanical Garden named after Emperor Peter the Great, who studied flora in the whole of the Bukharan Emirate. This can be found from letter No. 382 of the State Administration of Property and Agriculture in the Turkestan Territory, sent on January 11, 1916 to the Russian political agency in Bukhara. It contains information about the request of B.A. Fedchenko allocated the government of the emirate in the prescribed manner funds in the amount of 8,000 rubles, to assist and conduct scientific research in the territory of the emirate[3].

Such an event was carried out on the instructions and on the basis of the permission of the Turkestan Governor-General. In order to enforce this instruction, the Agriculture Department sent a copy of B.A. Fedchenko's application to the Russian political agency for representation to the emir. Turning to the range of works planned for the scientist in 1916, we found the following information: the scientist studied all areas and counties of Turkestan in a periodic sequence on the basis of the approved plan for 7 years, that is, until 1915. And, choosing as an object of investigation the plant world of the emirate. Having finished his activities, he announced that his goal was to compile a "Consolidated description of plants" in the flora of territories belonging to the Turkestan tsarist government. The scientist noted that he organized his activities only on the lands where he was sent by the Department for Resettlement, that the territory of the Bukhara Emirate has not been studied: "I am sure that the existing flora of the Bukhara region in studying the flora of the Turkestan Territory is of great importance. Botanical observations in the Bukhara region have not only scientific but also practical significance”[4]. Continuing his thought, the researcher writes about the need to study the forest regions of the emirate. B.A Fedchenko in his application, noting that prior to these four times, albeit in the shortest possible time, conducted a study of the plant world in the emirate's bekstva, makes it clear that in the future this can serve to increase the amount of income from the lands and requests to allocate for expenditures Expedition 8000 rubles. But representatives of the tsarist government chose to solve this problem through discussions and negotiations of the Russian political agency in Bukhara with the emir himself.

To accomplish this goal, the political agent in Bukhara, A. Belyaev, on March 3, 1916, sends a letter No. 1681 to the name of Bukhara's kushbegi Mirza Nasrullah[5]. In order for B.A. Fedchenko's petition sent to the above-mentioned institutions and the allocation of funds in the amount of 8,000 rubles to assist the expedition, the Bukhara Emir did not remain dissatisfied, he noted that the Turkestan governor-general personally asked the emir about it.

---

[1]The Turkestan branch of the Imperial Geographical Society was established on the orders of the government on May 20, 1896. Its activity began on November 28, 1896 in the city of Tashkent. Honorary members of this society were different high-ranking people who made a great contribution to the study of the Turkestan region from a scientific point of view. The first political agent of the Russian Empire in the Bukhara emirate, N. V. Charykov, was also a member of the Imperial Geographical Society. Individuals who are members of the society had to pay a membership fee of 10,000 silver rubles each year. See: Lunin B.V. [5]CSA RU. Form I-126, op.2, d.875, sh.3.

A reply letter expressing the attitude of the Bukhara emir on this issue was sent to the Kushbegi on March 21, 1916, in the Political Agency[1]. It noted that the emir, given the important practical significance of B.A. Fedchenko's research, gave an indication of allocating 8,000 rubles for the expedition. Kushbegi noted that it is necessary to notify the administration of the emirate of the allocation of funds on the basis of check No. 215503 by the Bukhara branch of the State Bank and on the receipt of these funds by the agency[2].

The second direction of measures to encourage the Bukhara Emir of the activities of representatives of Russian scientific societies and the public was to assist in the publication of scientific works related to the history of the emirate.

In the correspondence between the government of the Bukhara Emirate and the Political Agency of 1917, there is a notice of the government of the emirate to assist in the publication of the publication of the Imperial Geographical Society, connected with the history of Bukhara, ie. finished work "Information on the history of the Sheibanids dynasty: Abdullakhan and Abdulmuminkhan". On this issue, the political agent told the Emir personally at a meeting on January 29[3]. The attitude of the emir to this measure is expressed in the response letter kushbegi Mirza Nasrullabiya of August 31, 1917, sent to the name of a political agent. It noted that the emir gave permission to allocate funds in the amount of 5000 rubles for the publication of the book "Information on the history of the Sheibanid dynasty: Abdullakhan and Abdulmuminkhan", as well as the results of the study of the expedition of medical places in Bukhara[4]. Such information clearly demonstrates the provision of material assistance by the government of the emirate for the development of scientific branches.

The last stage of the correspondence of the Russian Imperial Political Agency was reflected in a letter of thanks sent to the name of the kushbegi of the Bukhara Emirate on behalf of the Russian political agency.

In correspondence, the presence of S.A Lidsky's letters[5], N.V. Veselovskogo[6], T. Ivanova[7], V.I. Lipskogo[8], S.I. Korzhinskogo[9], A.P. Mikhailova[10], Ardakani, M. P. et al[9], Srivastava, D. B.[10], Issaliyeva, A., et al[11], Vajravelu, K.[12], as well as letters of thanks from the leadership of the societies of which they were members. An example of this is the letter of the Russian political agency No. 3295 of August 22, 1897, sent to the name of the Janmirza-biy Divanbegi kushbags: "You, on the basis of my attitude in letter No. 2067, sent

[1]CSA RU. Form I-3, op.1, d.870, sh.5.

[2]Funds allocated by the scholars of the Bukhara Emirate for the study of the territory, through a special check, were delivered to the Political Agency. At the end of the letter it was noted that it is necessary to deliver the kushbegi information on the acceptance by the political agency of these funds. In fulfilling this requirement, the Russian political agency in Bukhara did not always apply to the kushbegi with a new letter, but at the top of the middle part of the reply letter sent to the kushbegi, informed that in accordance with the established procedure, these funds were accepted on the basis of the State Bank's check.

on the 9th day of the month of Muharram, 1315 (AH) informed that in order to be escorted to the Shugnansky region by the Russian scientist Ivanov (T. Ivanov conducted botanical observations in May-August 1897), he was appointed a companion of Oston Mirzabashi. Oston Mirzabashi, who recently returned, gave me information that Mr. Ivanov expresses his gratitude to the fact that the above-named official in many cases facilitated the journey, thanks to his enterprising, agility and good knowledge of local conditions. I have considered this circumstance above to be brought to you personally. Dear Diwanbegi, for your friendship, I ask you to express to him (Astana Mirzabashi) my sincere gratitude for the fulfillment of the task entrusted to him. I wish you the health and mercy of His Holiness the Emir"[1]. Следует заметить, что такие благодарственные письма обычно посылались после окончания экспедиций учёных и представителей соответствующих обществ, изучавших Бухарский эмират.

Conclusion

Thus, it can be stated that the Russian Imperial Political Agency, established in Bukhara in 1885, had a huge influence on the Bukharian authorities as an official representation of the Russian Empire, whose main functions were to control the government of the Bukharian emirate and the situation on the Afghan border, to protect the interests of Russian trade and industry, as well as the implementation of judicial and administrative-legal activities against the Russians who lived in the territories of the Bukhara Emirate . As a result, the Emirate of Bukhara was included in the system of international cultural and trade and economic relations.

Based on the analysis of archival documents, the following conclusions can be drawn:

In the late 19th and early 20th centuries, the territory of the emirate was studied by scientific societies of the Russian Empire in two directions. First. In the northeastern regions of Bukhara and the western regions of the Pamirs, botanical, geobotanical, geological, geophysical and geological surveys were conducted in the regions of Gissar, Baysun, Karshi, Kitob, Yakkabag, Shakhrisabz, Karategin, Kalaya Khum, Karatag, Kobodiyon, Darvoz, Balzhuvan, Shugnan and Roshan geodesic research;

The second. The territory of the central region of the Bukhara Emirate was studied mainly in archaeological, ethnographic, topographic and local history purposes.

Third. Despite the fact that during this period the Russian Scientific Society studied the territory of the emirate as part of colonial policy, approval and clearance of the emirate's government to carry out this research, the development of science officers, played a positive role, becoming a starting point for further development of the territory of the Emirate of Bukhara. Contribution to the formation of local archeology of the region by such researchers as B. Petrov, N.F. Sitnyakovsky, N.I. Veselovsky, L.A. Zimin, I.A. Kastene, N.N. Shcherbin-Kramarenko, E.E. Pirlik, as well as merit in the study of material culture, economy of the population of the emirate and the spiritual heritage of such scientists as P.P. Fetisov, S.G. Rybakov, A.A. Bobrinsky, N.V. Bogoyavlevsky, S.M. Dudin, N.F. Burdukov confirm the above.

[1] CSA RU. Form I-3, op.1, d.9, sh.90.

Fourth. Scientists engaged in research on the territory of the Emirate wide range of geo, eco and biobogatstv of strategic importance, carried out his research in the interests of the empire, as a result of their activities were discovered new species of plants made discoveries in the field of botany, Geobotany, geology, geophysics and geodesy, maps of locations of such minerals as gold, oil, nephrite, and coal were drawn up, new methods of their extraction were improved.

Fifth. The activities of such companies and expeditions were interested not only the tsarist government, but the government of the Emirate, as the Emir of Bukhara financially supported data expedition and allowed them the freedom to operate in the entire emirate, and are assigned to them Bukharan officials.

The sixth. To conduct research on the territory of the emirate, both parties observed the established procedure, fixed in the instructions related to issues affected in the correspondence and their implementation.

Seventh. There were appeals of Russian scientists to the Bukhara emir and kushbegi with suggestions on how to improve the use of natural resources. And also with the growth of active economic ties with Russia, the development of industry and the emergence of the local bourgeoisie, the need for literate people is growing, there is a need to study secular sciences in the Bukhara emirate itself. Although the main type of school in Bukhara remained maktabs - primary religious schools. In 1894, the first Russian-native school appeared here. By the end of the XIX century. new school methods are being created, and the first Russian settlements began to emerge here through Bukhara railway (1887).

Thus, it can be stated that by covering the history of the studies of the Bukhara Emirate by representatives of the scientific community, diplomatic correspondence conducted by the Russian Imperial Political Agency is a valuable source and requires further close attention on the part of scientists from various scientific fields.

Concept of Research Training of Students in Context of Competence-Oriented Technical Education

Oksana O. Gorshkova
Doctor of Pedagogy, professor, Tyumen Industrial University, Russia

Abstract

The relevance of the problem under study is conditioned by the incongruence between professional competences, acquired by graduates of technical institutes during the training process, increased demands of high-technology enterprises, scientific institutes, design organisations, employers. The purpose of the paper consists in solution of the problem of development and realisation of the concept of research training of students in the context of competence-oriented technical education. Based on the analysis, systematization and development of existing scientific and pedagogical approaches to solution of the problem of research training of students of technical institutes, the basic approaches and principles, being the methodological foundations when designing the concept of research training of students of technical institutes, were distinguished. The concept of research training of students in the context of the competence-oriented engineering education was created as a system of provisions in the field of professional training, including a programme-based system of education quality management; taking into account requirements of employers for research training of a graduate, specifics of research training as a basis of building a new didactics of an engineering higher school allowing realisation of requirements of educational standards on formation of a set of competences. The role of the process of research training of students as an obligatory part of realisation of educational standards in the context of formation of common cultural, professional, special competences and development of professional activity of an engineer was defined. The concept determines the necessity of monitoring the education quality, including the monitoring of the degree of students' research competence formation. Empirical methods (observation, questionnaire, conversations, testings, self-assessment, analysis of documentation, studying products of activity, pedagogical designing) allowed determining the level of research competence formation of students of technical institutes at all stages of experimental work on realisation of the concept of research training. To interpret the results of the experiment, the methods of mathematical statistics having allowed proving their authenticity and effectiveness of realising the concept of research training in the educational process of technical institutes were used, which contributes to the formation of students' research competence, development of their creativity, motivation, value attitude to research, formation of the orientation basis of activity. The materials of the paper are of practical relevance for teaching staff of technical institutes, for experts of the supplementary education system in the framework of organising refresher courses for managers and teachers of technical institutes; for experts in the field of methods, theory and practice of professional training.

Keywords: research activity; research competence, concept of research training, competence approach.

Introduction

Technological demands of global economy place challenges before Russia related to integration of the country into the world economic space, formation of favourable investment climate, competitive recovery of domestic industry. This determines the change of the nature of technical education, demanding from the graduate the mastery of a wider spectrum of key competences, ability to develop and introduce competitive technical equipment and technologies, orientation to research activity in the profession. Incongruence between professional competences, acquired by graduates of technical institutes during training, increased demands of hi-tech enterprises, scientific institutes, designing organisations, employers is one of the basic contradictions of the Russian higher technical education. There is a shortage of experts majoring in engineering, who are able to develop and introduce new, competitive technologies, technical equipment and are oriented towards research activity.

One of the key conditions of development of the higher technical education system, mentioned in "Concepts of long-term socio-economic development of the Russian Federation for the period up to 2020", is involvement of students into research and scientific work, which will allow preserving schools of thought, nurturing a new generation of researchers.

The change of the nature of engineering activity, conditioned by tendencies of modern production, transformation of industrial society into post-industrial, determines the image of the graduate of the technical institute, making demands for technical education, the strategic goal of which is establishment of an adaptive system providing training of the graduate in the context of professional mobility and competitiveness, as well as one's formation as a socially and humanism-oriented personality, being ready for research activity. Thus, the necessity and timeliness of creation and introduction of the holistic concept of research training of students in the context of competence-oriented technical education are obvious.

Research methods

There are theoretical (study, analysis and synthesis of pedagogical, social, engineering, economic literature on the problem under consideration; analysis of the research subject; modelling the education process; generalization of research results); empirical (study of normative documents, observation, conversations, testing, self-assessment, analysis of documentation, study of products of activity, pedagogical designing); experimental (a pedagogical experiment, methods of mathematical treatment of results) methods.

Results and discussion of research results

Methodological foundations of training students of technical institutes for research activity

Engineering activity, the specifics of which is determined by peculiarities of modern production, contributes to a fundamental change of an expert's image, and, accordingly, to the techniques of one's training as well; therefore, the necessity to create the concept of research training of students of technical institutes in the context of the competence approach, which will be adequate to modern realia, is evident.

When solving the problem of research training of students of technical institutes, the main reference point at the methodological level for the authors was the competence approach as a new understanding of the meaning of modern technical education in the framework of the Bologna Process. "Many ideas of the competence approach appeared as a result of studying the situation on the labour market, determining those demands for an employee that are formed on it" [16]. Such kind of education evolves owing to the need for such training of experts that would satisfy the society, production and higher school graduates themselves.

Having analysed works concerning the issues of competence-oriented education ([4], [7], [23], [24], [25], [29], [32], [33], etc.), the authors determined that the established theoretical and methodological base of the competence approach allows decomposing the structure of higher technical education, re-orienting its purposeful and effective attitudes. The competence approach is a "set of innovative theoretical and methodological ways and techniques of designing goals, content, technologies and results of education in the framework of philosophy of pragmatism and constructivism" [14].

The competence approach reflects a transition of education to a new attitude towards ability and readiness of the subject for effective activity in different scopes provided that there is a high degree of freedom, autonomy, development of personalized meanings, as compared to then existing subject-knowledge informative orientation.

The competence approach is oriented to transformation of goals of professional training, shift of emphasis to the student's personality. The main idea consists "not in the attempt to refuse "knowledge" orientation of education for the sake of competences, but in the fact that it is necessary to possess certain personal characteristics and be able to find and select necessary knowledge in information repositories, created by humankind, rather than to have knowledge" [3]. The competence approach reinforces the practical orientation of professional education, its subject-professional and pragmatic aspects. Besides, it provides for reevaluation of training results (formation of competences contributing to training of a competitive graduate) and, on this basis, implies a specific organisation of the educational process: reinforcement of problem-research, practice-oriented directedness; the emphasise is put on active, interactive technologies, use of information resources, a rating system, organisation of different forms of monitoring [30, 31].

The following aspects of the competence approach to the renovation of education are identified: making education pragmatic, which is aimed at development of students' ability to apply knowledge and skills in practical situations; increasing attention to generalised subject abilities; mastery of key competences providing interaction of a human being with other people in real social and professional situations [14].

Renovation of the content, forms of study is promoted by the fact that it is organised in the context of the future professional activity of the graduate. This implies inclusion of all kinds of learning activity associated with that of professional one in curricula and syllabi, organisation of practices including research tasks, projects completion, taking into account the needs of backbone enterprises; implementation of research and scientific work at the curricular and extracurricular time.

To realise the competence approach in technical education, it is necessary to implement the following principles:

- humanitarization of education, which will provide personality-developing nature of professional training, will contribute to effective self-development and self-realisation;
- integrity and interdisciplinarity, which is oriented to integration of disciplines at the level of content, technologies, and will provide their relevance to professional activity of an engineer as well;
- continuity of training from the viewpoint of content and technologies in the educational process will provide consistency of pedagogical requirements, oriented to development of readiness for research activity, formation of creative, productive thinking, as well as personal qualities that determine the competences under formation;
- diagnosticity provides for a stage-by-stage process of determining the level of formation of competences when using a criterion-evaluative set.

The competence approach was initially oriented to achieving specific results in the form of acquisition by the student of a complex of competences, characterising efficiency of professional education. They serve for presenting and designing educational results adequate to the rapidly changing world. Engineers-experts "form not only certain knowledge and skills, but also specific competences, focused on ability to apply them in practice when creating new competitive products" [9]. Consequently, designing the volume, the level, the content of theoretical and empirical knowledge, practical skills, work experience is in direct relationship with education results, expressed in the form of competences.

Approval and introduction of FSES of HE (Federal State Educational Standard of Higher Education) contributed to consolidation of legislative and regulatory frameworks of the competence approach at the government level (possibilities of FSES of HPE on formation of students' readiness for research activity were considered in the previous paragraph).

The competence approach in the methodological aspect bases on traditional approaches (axiological, value-motivational, synergetic, integrative, activity-based, context-dependent) to organisation of the educational process in the engineering higher school and can be optimally organised if the requirements of traditional approaches are met. The competence approach provides application of the mentioned approaches at a qualitatively new level, acting as an area of their interaction. Its meaning can be supplemented with the system of principles of traditional approaches. Therefore, the competence approach is considered by the authors in connection with traditional approaches as some "correlate" (A.G. Bermous). It acts as a link between practice and theory and is able to realise the connections among higher schools and employers, having practical and effective-purposeful orientation.

Let us consider traditional approaches from the viewpoint of research training of students of engineering institutes.

The systemic approach is realised during theoretical understanding, substantiation of holistic systems and methods of cognition allowing consideration of research training of a student as an integral system. It discloses the unity of its value, functional, activity-based aspects. The concept of the "pedagogical system", which (having analysed a multitude of definitions [6], [15], [20], etc.) is understood as an integrity in which interacting components contribute to the fact that the system performs the function of education, achieving the set results, namely training the student for research activity, is of great importance for solving the tasks of this research. Let us consider the following as components of the pedagogical system: a training goal, tasks, content, an educational process, students, teachers, training aids, pedagogical technologies, forms and methods of training. Interaction of the components of the pedagogical system generates a pedagogical process.

The study of provisions of the axiological approach allows regarding technical education as a socio-pedagogical phenomenon, which performs the following functions: cultural-creative, humanitarian and socialization functions. The axiological approach implies transmission, storage, reproduction and development of the culture of research using educational means. They contribute to acquisition and reproduction by a human being of certain social experience necessary for adaptation in society, realisation in professional activity.

The value-motivational approach [22] provides for activity aimed at organising interaction among students and teachers as subjects of the education process, contributing to formation of the value system when adopting an overall purpose, formation of motivation, contributing to "conscious acceptance and realisation of these values, establishing a correspondence between results of labour and a status attitude of participants of the educational process, facilitating a continuous growth of education quality" [22]. The value-motivational approach during research training contributes to harmonization of goals of students and teachers, formation of collective subjects of activity, motivated participation of subjects in research activity.

The synergetic approach as a theory of self-organisation orientates to formation of a new result of engineering education. The provisions of this approach allow considering formation of students' ability for self-organisation of inner resources and their orientating to research training during the educational process at higher schools as one of the main principles of engineering education. The synergetic approach contributes to consideration of objects and subjects of engineering education as complex self-organising systems, the main property of which is ability for self-development. Use of the synergetic approach when designing the concept of training students for research activity contributes to enrichment of the educational process with dialogue methods and techniques of pedagogical interaction, which intensifies the process of students' development.

The integrative approach provides for elimination of disconnectedness of higher school disciplines owing to cross-curriculum connections, deepening and consolidation of students' knowledge, formation of ability to compare, analyse and classify the obtained information; after all, phenomena of the objective world do not exist in isolation in separate sciences, they are closely connected, united with each other, and they must be studied in this unity. The authors share the opinion of A.N. Sergeev that all academic disciplines must be interrelated and interdependent despite the fact that each of them is a separate branch of science with its methodology, terminology system, methods [21].

The personality-oriented approach allows developing a student's personality as a subject of research activity. A technological potential of this approach consists of methods "corresponding to such requirements as: dialogic nature; activity-creative nature; orientation to support of student's individual development; providing a learner with a necessary space, freedom for making independent decisions, creativity, choosing the content and ways of learning and behaviour" [8]. Realisation of the personality-oriented approach during training for research activity contributes to formation of partnership interrelations between teachers and students.

According to the government strategy of education renovation, designing of all components of the training system is implemented based on the activity approach, in particular on the basis of formulation of competences in the activity format. In the studies on the activity approach ([2], [10], [17], [19]), the personality is accepted as a subject of activity, forming in it, as well as in communication, which determines the nature of the activity itself. The essence of the activity approach consists in training students based on productive activity, which forms them. According to the research of A. Diesterweg "knowledge and skills … cannot be given or communicated" [13]. It is possible to be drawn to knowledge and skills and to achieve certain results only through activity. From the position of training for research activity, the provision about organisation of activity, in which the student acquires models of professional activity, assesses their possibilities and prospects of application, is important.

The context approach, created in the development of the activity approach – "in the language of science and by means of the entire system of forms, methods and means of training, models sequentially the subject and social content of the future professional activity of students" [9]. During research training, the content of professional activity of an engineer will be modelled in the forms of students' activity. Students must assess the training process using comprehensible criteria; then there is personal activity of the student, ones' interested participation in forming oneself as an expert" [9].

The competence approach starts with cardinal reconsideration of the training results; it implies a new approach to designing expected results, and only then, on this basis, the content of training and the training process change in a varying degree. Thus, "a context approach can be considered as an effective means for achieving goals, set in connection with realisation of the competence approach" [7].

The competence approach to building the concept of research training of students of technical institutes is concretized in principles regulating this process: succession, integration, unity of educational space, training intensification, creativeness and activity-based orientation, reflexivity; let us consider them.

The succession principle allows building the concept having preserved consistency and continuity of research training of students in the course of general professional training. Succession provides an optimal connection between the stages of student's formation as a subject of research activity. Succession implies preservation at each stage of an accumulated system of knowledge, formed abilities, skills and determines possibilities of subsequent development.

The integration principle is aimed at holistic perception of knowledge in conditions of integrating materials in different scientific fields, presence of inter-disciplinary dependences and connections. "Integration implies combining parts into something whole" [18]. Pedagogical integration during research training implies unity of the following constituents: teaching-learning-research, which contributes to integration of theoretical and practical training; interdisciplinary integration of disciplines; integration of efforts of all participants of the educational process oriented to research training of students of a technical institute; integration of independent work of students and different forms of classroom work. The integration principle discloses the cross-curriculum integrative nature of research training, manifests itself in connections of disciplines realised by means of active, interactive, informational and communicative technologies.

The principle of unity of educational space determines formation of developing educational environment of a technical institute containing personnel, management and information resources, oriented to research training. Research space, formed in the developing educational environment, combining research and learning activity of subjects of the educational process, is practice-oriented.

The practice-orientedness principle implies consideration of requirements of employers and provisions of professional standards during research training, formation of the system of partnership with backbone enterprises.

The principle of training intensification is considered as an increase in development of student personality owing to one's maximum allowed involvement in implementation of different types of scientific, learning, research activity. The main factors of intensification during research training are: enhancement of training purposefulness; strengthening of motivation and positive personality orientation to formation of readiness; an increase of informative capacity of education content; application of active, interactive methods and forms of training; development of skills of research activity; use of information technologies, network educational resources.

The principle of creativity and activity-based directedness implies creation of conditions for creative development of both students and teachers in the atmosphere of collaboration and co-creation. The indicators of creativity are: "originality and irregularity; nature of reaction, emphasizing its rapidity; emotionality, imagination, flexibility; analysis and reflection; independence and activity" [26]. Activity-based directedness determines the fact that the basis of the process of research training is ways of student's work, approximated to real research activity of an engineer in the framework of each course, co-creation of students and teachers during activity.

The reflexivity principle implies involvement of reflexivity in learning and research activity for the purpose of development of students' self-control, their involvement in the process of co-management of education quality during their self-organisation in the course of research training, which is aimed at changing of relation to training results, development of aspiration for self-perfection and self-realisation.

The analysis conducted showed that the considered approaches supplement each other and realise different plans when considering the issue of research training. The competence approach, interacting with traditional approaches (axiological, value-motivational, synergetic, integrative, activity-based, context), is backbone and introduces principle changes in the process of education, expressed in the strengthening of practical orientation and instrumental directedness of engineering education, creates optimal opportunities for research training of students. Methodological principles concretize provisions of the competence approach and, along with it, are methodological bases when creating the concept. Realisation of the competence approach and methodological principles of technical institutes implies the possibility of changing the management system of the higher school, in particular education quality management, oriented to research training of students.

Content of the concept of research training of students of technical institutes

The concept of research training of students of engineering institutes (hereinafter concept) is a complex of attitudes and concepts in the field of professional training of students built on the basis of the theory of the competence approach and principles of designing the process of formation of research competence, generalizing progressive educational experience in this field, formed as of today, considering the fundamental needs of modern society and production. The concept of research preparation of students in the context of competence-oriented engineering education determines research training as a basis of building innovation didactics of an engineering higher school in the framework of the developing national system of qualifications, allows realising requirements of FSES of HE for formation of a set of professional, special, common cultural competences.

The concept describes a process of research training of students, means and methods of its realisation and includes (Figure 1): common provisions (purpose, tasks, prerequisites of development, methodological support, a normative base, a terminology system); methodological support (a competence approach, methodological principles); content – a functional model of training a student of an engineering higher school for research activity; verification.

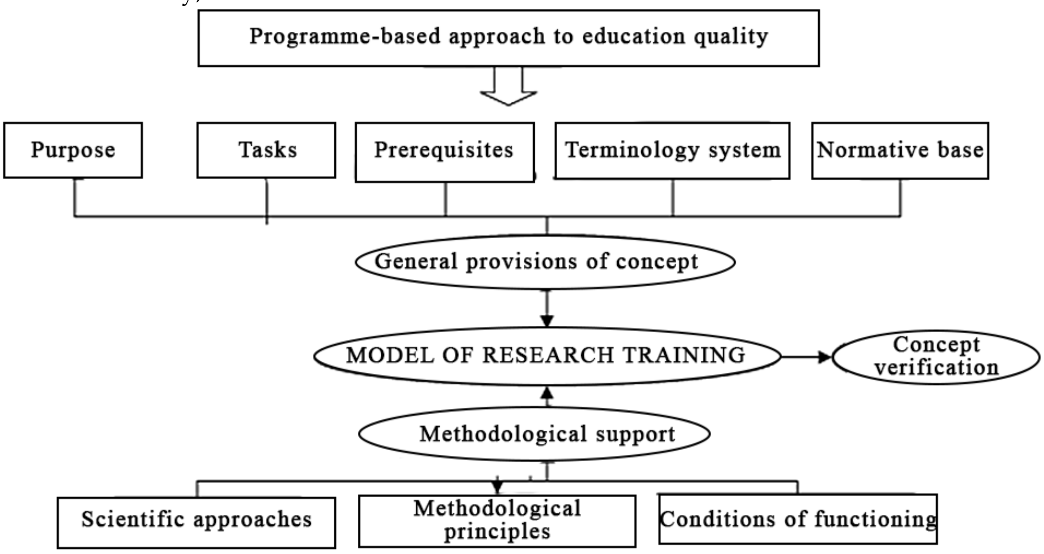

Figure 1 Concept structure of research training of students

The purpose of the concept is substantiation of the process of formation of a creative subject of engineering activity with a developed research attitude and reflection, ready for active participation in innovation engineering processes, capable to develop new ideas, solve research production tasks and make non-standard decisions.

The following tasks were solved in the concept:

- methodological foundations of preparing students of engineering higher schools for research activity were defined;

- principles constituting the basis of effective selection of content and technologies of preparation for research activity were formulated;
- components were structured and integrated into the holistic functional model, necessary changes were introduced into the process of professional preparation;
- criteria and indicators of readiness for research activity of a student of an engineering higher school were determined.

When building the concept, it was determined that *prerequisites* of its development are:

- peculiarities of modern engineering education (change of the educational paradigm, introduction of the competence approach in engineering education, introduction of FSES of HE, which consider research activity as an integral part of engineering activity; search for innovation pedagogical solutions, providing enhancement of effectiveness of engineering education);
- changing structure, content and nature of engineering activity, which is underlain by research aspects;
- changing requirements for a graduate of an engineering higher school according to professional standards, demanding preparation of specialists, capable of providing high production results and being ready to realise exploratory search;
- age-related and socio-pedagogical peculiarities of students of engineering higher schools, contributing to professional training for research activity;
- experience of pedagogical science on professional training of engineers capable of adapting to changing production conditions; historical prerequisites taking into account the experience of preparation for research activity; results and experience of pedagogical studies in the field of improving content, forms and methods of engineering education.

The mentioned prerequisites were the motives of formation of the concept; besides, it is necessary to note that the more the higher school is capable of progress, the higher the level of research activity of students and teachers. In engineer's activity, the research nature reveals itself as key; it allows realising creative self-development contributing to successful professional activity. Therefore, research preparation of students is a condition of competitiveness of Russian engineering education and is considered by the authors as a strategic guideline, in which direction the professional training of students of technical institutes will be realised.

The normative basis of the concept consists of: the Russian Federation Laws "On education in the Russian Federation", "The concept of long-term socio-economic development of the Russian Federation for the period up to 2020"; "The Law on higher and post-graduate professional education", "National doctrine of engineering education in the Russian Federation", "The concept of development of research and innovative activity in Russian higher schools", FSESs of HPE, professional standards.

The terminological system of the concept is represented by notions reflecting specifics of the process under study: "research activity", "research learning", "research competence", "developing educational environment of a higher school", "research training", competence-oriented engineering education".

The problem of preparation of a technical institute student for research activity is solved by the authors from the position of the competence approach, which, interacting with traditional approaches, introduces fundamental changes in the training process, manifested in the strengthening of practical orientation and instrumental directedness of engineering education, creates optimal opportunities for research preparation of a student.

Methodological principles, allowing one to select the content of preparation for research activity and to organise the competence-oriented training process, were taken into consideration in the concept: the succession principle, the practice-orientation principle, the integration principle, the principle of unity of educational space, the creativity and activity-based principle, the reflexivity principle.

Realisation of the competence approach and methodological principles implies reconsideration of purposes, content, techniques of professional training of students of an engineering higher school, which is possible when changing the system of education quality management aimed at a result, namely the preparation of students for research activity, inextricably connected with the level of formation of common cultural and professional competences.

Comprehension of scientific, pedagogical, methodological foundations of the system of education quality management in a higher school, which provides motivation of participants of the educational process to enhance the education activity quality, contributed to a transition to a programme-based system of education quality management in a higher school, which is characterised by the following features: “focus on the end result; system understanding of the object; a planned quality level; complex analysis of problems; a complex approach to the choice of purposes and means of their achievement; linking together purposes and resources (creation of a goal-oriented programme); aspiration for maximal effectiveness of achieving purposes when using resources rationally; integration of efforts of a higher school and enterprises” [12].

The program-based system of education quality management allowed:

1. establishing attainable goals, namely formation of students’ readiness for research activity;
2. establishing a developing educational environment in a higher school;
3. building a united team (representatives of a higher school, backbone enterprises);
4. developing a training programme for research activity (a functional model);
5. guaranteeing necessary support: personnel, material and technical, informational, methodological, etc.

The research training of students of a technical institute was determined as a programme of ideology of the higher school functioning; hence, a systematic monitoring of the quality of research competence formation is an integral part of the management system.

Having analysed a number of works on organisation of educational environment of a higher school ([5], [27], [7], etc.), the authors concluded that formation of developing educational environment in a higher school is an obligatory condition for solution of the task of establishing innovative didactics of an engineering higher school, aimed at research training of a student; at that, employers’ requirements for training students for research activity, characterized by an individual and productive style of engineering activity and professional standards provisions, are taken into account. The developing educational environment of an engineering higher school can be considered as a competence-oriented space, in which a set of conditions, aimed at provision of optimal parameters of educational activity of a higher school, is created, namely provision of purposeful, informative, operational, effective, resource aspects.

The technology of organisation of developing educational environment of a technical institute consists of several stages:

1. motivation for research training of students of an engineering higher school;
2. interactions and joint activity of all subjects united by the environment space;
3. students’ self-regulation and self-generation during research training.

The developing educational environment of a modern technical institute includes the following structural components, which are provided with personnel, management and informational resources.

A spatial-subject component: architectural and esthetic organisation of the educational process (architecture of buildings; classrooms, equipment, etc.); a symbolic space (symbolism and traditions of a higher school).

An informative component: a functional model of research training as an informative content of the concept.

An organisational component: a personnel resource, a management resource, a communication field (partnership interrelations between a teacher and students on the basis of accepting common goals; harmonization of interests of all participants of the educational process (higher school management, work group, teachers, students, representatives of enterprises); creation of an atmosphere of productive activity, organisational conditions. The personnel resource provides for creation of a team of like-minded people, united by a single goal owing to coordinating the work of structural subdivisions of a higher school (sub-faculties, an internship department, an academic office), as well as separate teachers; enhancement of professional competence of higher school employees (refresher courses, seminars, consultations, round-table discussions, etc.).

An information component provides for network interaction with representatives of backbone enterprises, use of network educational resources, introduction of the electronic system of support of the educational process aimed at solution of relevant tasks of education informatization, including development of infrastructure of a united educational informational space, development of electronic educational resources.

Educational environment (Figure 2) is characterised by a structure, in which elements are interconnected and are in the indissoluble unity.

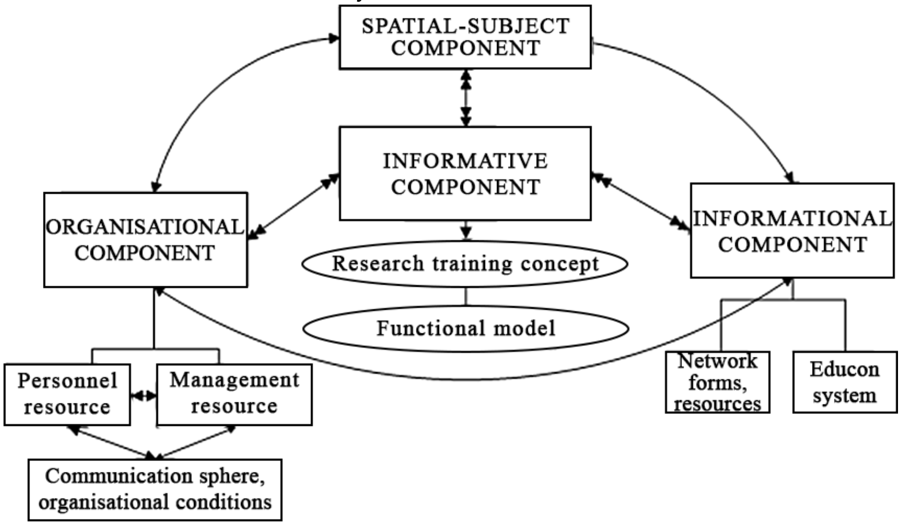

Figure 2 Structure of developing educational environment of technical institute

The authors of the paper proved that establishment of developing educational environment requires: 1. organisation of interaction and joint activity of all subjects united by the space of environment during training; 2. integration of training and research at all stages of the educational process; 3. transformation of the content of education, development of new and improvement of existing methodological support; change of organisational-technological foundations of the educational process;

- formation of the system of partnership with higher schools, scientific organisations, enterprises; realisation of the network form of interaction (agreements on complex collaboration were concluded with backbone enterprises). This allows conducting purposeful distribution of graduates, attracting representatives of enterprises to the process of research training (development and correction of main educational programmes; internship programmes, a fund of evaluating means, research tasks (connected with real problems of production), participation in control events (presentation of research papers, term projects (papers), graduation theses); conducting internships, field laboratory and practical works; organising probations for teachers; monitoring of current and prospect demands for graduates, consideration and analysis of successful activity of higher school graduates, etc.);
- extension of the set of competences of FSES of HE owing to special competences;
- providing personal and professional development of students, involvement in the process of co-management of education quality with their self-organisation during research training (increasing the share of independent work, rejection of reproductive methods). Students master their role in the educational process, as well as culture of self-organisation in learning activity, self-regulation of the process of research training, which contributes to change of the attitude to training results and more competent evaluation of one's own preparation quality.

Thus, the following principles are core for realisation of the concept: the programme-based approach to management – systematic monitoring of readiness of students for research activity; organisation of developing educational environment in a higher school providing for motivation, interaction and joint activity of all subjects, united by the environment space; integration of training and research at all stages of the educational process; transformation of the content of engineering education, development of practice-oriented methods, special forms and means of students' activity; taking into account requirements of employers and provisions of professional standards based on formation of the system of partnership with backbone enterprises; involvement of students in the process of co-management of education quality with their self-organisation in the course of research training; criterion nature and diagnosability of results.

The content of the concept is realised in the functional model of students' preparation for research activity being a basis of innovative didactics of an engineering higher school. The concept is of interdisciplinary nature, being a part of the holistic content of professional training, is represented as a basis of organising the process of students preparation for research activity. The represented structure of preparing students of engineering higher schools for research activity is invariant and can be used in the educational process of other higher schools.

The assessment of effectiveness of realising the research training concept, expressed in the assessment of formation of research competence of students of technical institutes, was made by means of criteria, indicators. Cognitive, personality, activity-based components, which are also used as criteria, were identified as components of research competence. The cognitive one determines the degree of mastery of the conceptual framework, ability to use the formed theoretical basis during research activity. The personality one is motives and value attitudes of the personality, student's reflection during research activity. The activity-based one determines the degree of mastery of ways of performing research acts, possibility of applying mastered ways of action and accumulated knowledge in practice [28].

Experimental work on realisation and verification of the concept has confirmed the effectiveness of its basic provisions. The total number of people, involved in the experimental work, was 1520; among them, there were 1390 students and 130 teachers.

The experiment on realisation of the concept underwent 3 stages. At the ascertaining stage, it was defined that at the beginning of the experiment, research competence of the first-year students had not been formed; among the graduates (before the beginning of the experiment), the students with a low level of research competence prevail, which reflects the results of the process of traditional professional training in the technical institute. At the forming stage, pedagogical expediency of introducing the concept of research training of students of technical institutes was proved experimentally. The generalizing stage was aimed at assessment of the concept effectiveness, by means of revealing the resulting dynamics of research competence formation of students of technical institutes. Results of control assessment are presented in Table 1 [11].

Table 1

Dynamics of readiness formation for research activity, %

Personality component	2012-2013 academic year		2013-2014 academic year		2014-2015 academic year		2015-2016 academic year	
Motivational	Exp.	Cont.	Exp.	Cont.	Exp.	Cont.	Exp.	Cont.
Highest	0	0	3	0	3	1	3	1
High	0	0	27	2	37	3	45	9

Comparison of the data of initial and final assessments showed a stable growth of indicators by all components of research competence of students of experimental groups versus the compared results of control groups and results of graduates before the beginning of the experiment. The credibility of the results was confirmed by the verification on the basis of statistical analysis using criteria of mathematical statistics. The results of the experimental work show effectiveness of the developed concept realised through the functional model of research training of students of technical institutes.

Conclusion

The concept of the research training of students in the context of the competence-oriented technical education determines research training as a basis of building innovative didactics of an engineering higher school, which allows realising requirements of FSES of HE on formation of the complex of professional, special, common cultural competences. The following principles are basic for realisation of the concept: the programme-based approach to management – systematic monitoring of formation of research competence of students; organisation of developing educational environment in a higher school, providing for motivation, interaction and joint activity of all subjects, united by the environment space; integration of training and research at all stages of the educational process; transformation of education content, development of practice-oriented methods, special forms and means of students' activity; taking into account requirements of employers and professional standards based on formation of the system of partnership with backbone enterprises; involvement of students in the process of co-management of education quality along with their self-organisation during research training; criterion character and diagnosability of the results.

The results, obtained during the experimental work on approbation of the main provisions of the concept, showed that its introduction contributes to development of student's creativity, motivation, value attitude to research, readiness for active participation in innovative engineering processes, ability to develop new ideas, solution of research production tasks and making unusual decisions.

Theory and Practice Development of Technical Universities Students' Research Training

Oksana O. Gorshkova
Doctor of Pedagogy, professor, Tyumen Industrial University, Russia

Abstract

The relevance of the problem under study is caused by the non-compliance of the level of technical universities students' research training with the modern requirements of the society and production development. The educational system in technical universities does not create the conditions sufficient for the formation of students' research competence, their creative potential fulfillment, personal and professional development, comprehensive solutions for research problems. The objective of this article is to solve the problems of the theory and practice of the students' research training development in the context of competence-oriented technical education. Based on the analysis, systematization and development of the existing research and pedagogical approaches to the problem of the technical universities students' research training, the main approaches and principles have been identified. These approaches and principles are the methodological basis when designing the concept of students' research training that determines the research training as a framework for innovative didactics of the technical universities building, allowing implementing the requirements of the educational and professional standards on the formation of competencies complex. The main stages of solving the problem of technical universities students' research training in the process of studying this problem historiography were highlighted. Theoretical methods made it possible to determine the research nature of engineering allowing the university graduate as a subject to interact through it with the world and acquire the ability to change it. Based on the analysis of educational, professional standards and employers ' requirements, the research tasks that the university graduate should be able to solve, and the research skills complex were determined. The empirical methods (observation, questionnaires, interviews, testing, self-evaluation, documentation analysis, products of activity study, pedagogical design) allowed us to determine the level of research competence of technical universities students' formedness at all stages of the experimental work on the implementation of the functional model being the main part of the research training concept. To interpret the results of the experiment, the methods of mathematical statistics were used that made it possible to prove their authenticity and the model implementation effectiveness in educational process of technical universities. The materials of the article are of practical importance for the academic teaching staff of the technical universities, for specialists of the additional education system in the framework of the upgrade training courses for technical universities managers and teachers, for specialists in the field of methodology, theory and practice of vocational education.

Keywords: research activity; research competence, concept of research training, functional model of research training.

Introduction

The international community seeks to create a global strategy for human education that promotes the development of international educational space. The study of innovative changes in modern society presented in the researches of the Canadian Centre for Innovation Studies Professor Fred Gault shows that 'the key components of innovation development are grouped around six main global components: markets, people, innovation activities, public interests, international cooperation and the global changes' [32]. High-tech product that is one of the determining factors of the countries development becomes the main result of engineers' creative activity.

The global requirements to the engineering university graduate, the characteristics of the modern production in Russia, the industry modernization and high technology development needs the training upgrade of the competitive specialists with modern knowledge and skills, the production and personal potential required for working at high-tech enterprises. This explains the fact that in modern conditions of the society and production development, the main strategy for moving forward is the development of creative and research capacities of employees within their professional activity and the increased requirements in this respect to the graduates of technical universities. A new class of information technologies – Computer Aided Invention that help to generate innovative ideas, gets a widespread use. 'E-learning is developing dynamically, transforming into the direction of 'smart' educational systems' [33, 34].

Methods of research

Theoretical (study, analysis and synthesis of pedagogical, social, engineering, economic literature on the problem under study; analysis of the research subject; modeling the educational process; generalization of the research results); empirical (study of the reference documents, observation, interviews, testing, self-evaluation, documentation analysis, study of products of activities, pedagogical design); experimental (pedagogical experiment, methods of the results mathematical processing).

Results and discussion of the research results

Features of modern engineering education in Russia

In modern conditions, Russia is facing the global challenges related to the country's integration into the world economic area, formation of congenial investment climate, increase of competitiveness of the domestic industry, 'formation of the Russian world brands' [1]. The importance for national security and economy competitiveness of the country is the equipment innovations and technologies that demands new priorities for engineering activities that are determined by the features of modern production, among which we can highlight:

- the accelerating dynamic change of social processes, generational change of equipment, technology upgrades in the shortest possible time, and, consequently, the change in the functional and value orientation of labour;

- integration strengthening in the modern science and production. 'The close interaction and interpenetration of fundamental and applied research, highly inter - and multidisciplinary nature of new technologies, and the impact of cyber infrastructure allowing you to solve complex problems in new areas requires new paradigms for engineering' [1].

- intellectualization of the production basic factors.

- processes of informatization penetration into all spheres of human activity.

The changing nature of engineering activity, its consideration as a form of approval of occupational and personal identity, its self-fulfillment promote the priority development of creative and research aspects demanding the formation of creative engineers capable to solve the production research problems effectively. 'The Russian higher educational institutions are at the intersection of innovation processes and the need for training to research, development and application of high technologies in all branches of knowledge' [10]. The characteristic trend of changing requirements to technical university graduate is a convergence of practical and scientific spheres of its activities: from the processes of devices operation to fundamentally new systems and technologies creation.

The qualitative improvement issues for research training of technical universities students acquire the particular relevance since one of the main tasks of higher education is to involve students in research activity that will make possible 'not only to save the Russian scientific schools that are well-known in the world but also to train a new generation of researchers focused on the needs of innovative economy of knowledge' [16 ,36]. Certain requirements are put forward for technical education, namely: to correspond with the constantly accelerating rates of intellectual changes; to apply and develop modern achievements of science, develop, complexate (aggregate) and apply the advanced science-intensive technologies and processing chains at different levels of the problem description: to apply the complex approach to meeting the social needs 'integrating the social, economic, environmental, and legal conditions into technologies, developments and innovations' [19, 35].

This implies a significant revision of educational traditions, changes in tasks and objectives, and technologies of the technical education. Research training allows you to implement the educational standards requirements in full scope, form the complex of competences and it promotes the development of students' creativity, their research capabilities, the formation of functional skills of research as universal ways of contact with the outside world.

Training practice analysis of technical universities graduates shows that the level of their research training does not correspond to current requirements. The educational system in technical universities does not create the conditions sufficient for the formation of students' research competence, their creative potential fulfillment, personal and professional development, comprehensive solutions for research problems.

The strategic aim of the technical education development in Russia is the adaptive system creation that provides graduate training in the framework of professional mobility and competitiveness, as well as his becoming as a socially and humanistically oriented person ready for research activity. With this, the unique experience, traditions and enduring values of the Russian technical school should form the basis.

Historiography of the problem of research training of the technical universities students

According to the analysis of historiography of research training problem, 4 stages were highlighted:

- Stage I (from 1918 until the late 40-ies of XX century) - formation of the engineering education system, the problem was not yet the subject of the scientific study but there were real preconditions for its conscious setting;
- Stage II (50-ies - the late 80-ies of XX century) - improvement of the scientific organization of students' work is considered as a condition for enhancing the quality of the university-level education;
- Stage III (90-ies of XX century to early of XXI century) – slowdown in the development of research training in technical universities;
- Stage IV (beginning of the XXI century to the present day) - comprehensive study of the problem, preparation for research activities is focused on the engineer's future professional activity [4].

The problem analysis of the historical formation of the students ' research training also confirmed that the remained in technical universities 'knowledge' approach focused on the development of technologies used to date and the achieved level of sciences development that is implemented in subject-centered traditional forms does not meet the requirements of postindustrial society. Technical education in Russia is at the stage when the research training issues require the substantiated modernization of the learning process at the university.

Age peculiarities analysis of students of technical universities showed that changes in various spheres of personality at the given age stage 'when the authorship in the development of capabilities, the conscious and purposeful self-development begins' [17] are the prerequisites for the development of their research competence.

Thus, the analysis of the characteristics of modern engineering education in Russia allows us to state:

- the basic contradiction of engineering education in Russia is the discrepancy between professional competencies of the technical universities graduates that they obtained in the process of training, the increased requirements of high-tech industries, enterprises, employers, scientific institutes and organizations. There is a shortage of technical specialists capable to develop and implement new, competitive technologies and equipment oriented on the engineer's research activity;
- trends of modern production caused by the industrial society transformation in post-industrial one determine the image of the technical university graduate capable to personal and professional self-fulfillment specifying certain requirements to technical education;
- the paradigm change of the Russian technical education system is conditioned by the processes of integration into the world educational space;
- the unique experience, traditions and enduring values of the Russian technical school should form the basis of engineering training.

Analysis of the existing approaches to solving the problem of technical universities students' research training

Status analysis of the scientific support for technical universities students' research training showed the presence of a number of previously developed concepts, models, and technologies submitted in the thesis researches. We highlighted, systematized and developed the existing approaches to the solution of this problem promoting the development of the methodological basis of this training. It was revealed that the authors focused on the separate sides of the phenomena under consideration, namely:

Issues of the research activities motivation were considered in the researches of S. A. Nenasheva [12] and A. L. Mazaletskaya [11] where the effectiveness of interdisciplinary integration of scientific knowledge in the project research activities was proven; provision of emotional and value component; formation of the student's stable orientation to scientific cognition. I. Yu. Danilova [6] determined that the research activities motivation promotes creating the atmosphere defining an independent search for tasks solving; comfortable psychological environment, encouragement of the aiming for research.

A number of researchers (A. A. Gubaidullin [5], A. A. Ermakova [7], M. A. Osintseva [14], et al.) studied the possibilities of preparing students for research activities through the use of research tasks and giving them a problematic character; encouragement of innovative approaches and methods of solution; the computer technologies applications. N.I. Naumkin [13] considered the preparation for research activities through immersion in engineering creativity (training in Olympiad environment), the application of knowledge in solving research tasks, experimental vocational-oriented tasks, course design.

I. A. Yanyuk [24] determined that the effective formation of research competence of technical universities students was possible provided that in the university there is a favorable environment for the student's perception of the professional activity model and the implementation of early professional self-determination. D. R. Salyamova [18], studying the issues of improving the efficiency of research activities came to the conclusion the development of partnerships between government, scientific structures and universities, the creation of conditions for highly qualified university personnel attraction and retention requires special attention.

In studies on the formation of research skills, the authors [9], [20] identified the conditions necessary for this: the educational process saturation with creative situations, its creative organization; the introduction of elements of research activities; the transition from reproductive to productive activities.

A number of researchers [13], [21], [23] studied the possibilities of the competence-based approach in the process of preparation to research activity and they found that the formation of students willingness for educational and research activities was possible with: the introduction of special courses, stimulating motives of the research activities, use of active methods, information technologies, modular training.

The works analysis showed that the researchers focused on the important aspects of research training, much attention was paid to the content of technical education, technological component of training. But in the works, the conceptual idea of students training for research activities, that requires specially organized measures and has a significant potential in improving the quality of technical education is reflected inadequately. The research activity was not considered as a basis for the formation of common cultural, professional and special competences with the purpose of the educational and professional standards requirements implementation, and consequently the process of the research training is not studied from the position of the creation basis of the engineering university innovation didactics. The issues regarding quality management system of education change left unattended. The issue of creation of the university developing educational environment also was not addressed. The connection between the university and employers, their participation in the process of students training for research activities is not observed. Therefore, the need and timeliness of creating and implementing the holistic concept of engineering university students' preparation for research activities in the context of competence-oriented engineering education is obvious.

Study of foreign experience [2], [3], [25], [26], [27], [30], [31], [37] made it possible to highlight a number of provisions that should be taken into account when preparing the students of engineering university to research activities, namely: the inclusion in the curriculum of special courses, special practicums focused on research training; gradual familiarization with the methods of solving the research problems, use of heuristic methods, methods of generating ideas; development of industrial design skills, aesthetic development of students; implementation of group and individual research projects in order to attract students to scientific-research activities; close cooperation with basic enterprises; replacement of competition with cooperation; ethic education (in research activities.

Close interaction with employers during the study allowed determining the basic requirements to research training of technical universities graduates:

- capacity to conduct research of technical devices, technologies, and processes with the purpose of modernization and improvement of the enterprise operational efficiency;
- capacity to work with information for the purpose of analyzing, evaluating operation conditions, diagnosing, monitoring of processes, taking corrective measures in cases of deviation from the parameters specified;
- capability to take optimal decisions in emergency situations and analyze them;
- capability to solve research problems in standard and nonstandard situations; to assess risks, make decisions by taking into account complex of production factors;
- capability to use the mathematical tools, application software products, technical resources, network resources;
- active work in team when developing projects aimed at performance gains;
- adequate analysis of the activities; self-control, activity in self-development, self-enhancement and self-affirmation in the profession.

The content and structure of modern engineer's research activities

Analysis of professional standards, structures of engineering activities, complex of all-cultural and professional competences showed that the research nature manifests itself as a leading component in all activities of the engineer. The highlighted job functions coupled with the necessary skills have a research component (orientation) and determine the need for the research training of students of technical universities.

Relying upon the provisions existing in science on the activities structure [8], [15], [22], we have identified the following components of engineer's research activities: object (production processes, technologies, technical elements, etc.), subject (the technical objects properties under study and the process of new knowledge acquiring), motives (need for self-fulfillment and self-enhancement, striving to acquire knowledge, responsibility for results, the need for recognition and self-affirmation, pursuance of material goods), objective (improvement of technical and economic indicators of production, ensuring its continued operation), actions (organizational, operational, controlling and evaluation), result (elimination of technical malfunctions, failures, improving technical and economic indicators of production, implementation of new technologies, innovation proposal, invention).

Determination of the engineer's research activities structure permits to pay particular attention to the didactics of the research tasks solution that were highlighted according to the results of educational and professional standards analysis taking into account the requirements of employers, namely: 1) analysis of the technical devices operation and organizational processes; 2) experimental studies of the objects by selecting optimal methods; 3) statistical processing of experiment results, preparation of reporting documentation; 4) collection of original data and their submission with the purpose of objects modeling; provision of project documentation for improvement of production processes, technologies, equipment; works on definition of methods to eliminate (prevent) negative impacts; 5) computation of the processes design and assessment of various factors effect on production processes; efficiency assessment of the solutions; 6) results provision in the form of design, technological, and process control documents.

The competencies specified in the educational standard are insufficient to provide the students' research training, so we offered to increase their set at the account of special competencies, namely: capability to realize the nature and significance of research activities in the general structure of engineering activity, its importance in self-fulfillment in profession taking into account aesthetic and ethical standards; to have a system of value orientation of research activities, its motivated implementation (SC-1); the willingness to apply the formed generalized recommended sequence of the research activities effectively when conducting multi-disciplinary research (SC-2); willingness to work in the engineering profession based on self-reflection (SC-3) [4].

In the process of study, we identified a number of provisions that were not included in the standards but necessary for the formation of a competitive graduate: FSES (Federal State Education Standards) mandatory compliance with professional standards, accounting of integrative processes, inclusion in elective course the special courses focused on the projects implementation, crosscutting research tasks, work with basic enterprises, conclusion of contracts on goal-oriented preparation of students, introduction in educational process of the virtual laboratory works providing access to the unique and closed processes, technologies, equipment.

The engineering specifics, implementation of competence-based approach in engineering education, Federal State Educational Standards of Higher Education, adoption of professional standards fundamentally change the outlook on the ways of students training determining the need in searching a model of the educational process in engineering university focused on graduates' preparation to research activities. It should serve as a basis for building an innovative didactics of engineering university that allows you to implement the educational standards requirements, form the complex of competences and it promotes the development of students' creativity, their research capabilities, formation of functional skills of research as universal ways of contact with the outside world.

Research training concept of the technical universities students

We have developed the concept of students' research training. This concept includes the program and goal-oriented system of education quality management that takes into account the employers requirements to research training of graduates, the specifics of the research-based learning as the basis of building an innovative didactics of the engineering university in the context of the developing national qualifications system.

The novelty of this concept is that it provides the setting of new objectives, tasks, organization of the new developing environment in higher education institution focused on research training technical universities students.

The concept objective: development of the creative subject of engineer's activities with the advanced research position and reflection with formed competencies, providing the ability to perform research functions in the process of professional activities in accordance with the requirements of the modern society and production.

The concept solved the following tasks: methodological backgrounds of the research training of technical universities students were defined; the basis principles of the content and research training technology effective selection were formulated; the components were structured and integrated into a holistic functional model, the necessary changes to engineering training were made; the criteria and indicators of research competence of students of technical universitiess were defined.

The problem of technical university students research training is solved from the point of view of competence approach, that promotes the strengthening of the practical orientation and the instrumental orientation of technical education, creates optimal opportunities for research training of students.

Part of this concept was the program and goal-oriented system of education quality management. We proved that the development of students' research abilities correlates clearly with the quality of higher education. There is a level of education quality when talking about the research skills of students is not possible.

Program and goal-oriented system of education quality management made it possible to determine really achievable objectives, namely the formation of students' research competence, to organize the developing educational environment in the university, to build a consolidated team (representatives of the university and basic enterprises); to develop a program of research training (functional model), to ensure the necessary provision: personnel, material and technical, informational, methodological, etc.

The structure of the research training of technical universities students presented in Figure 1 is invariant and can be used in the educational process of other universities.

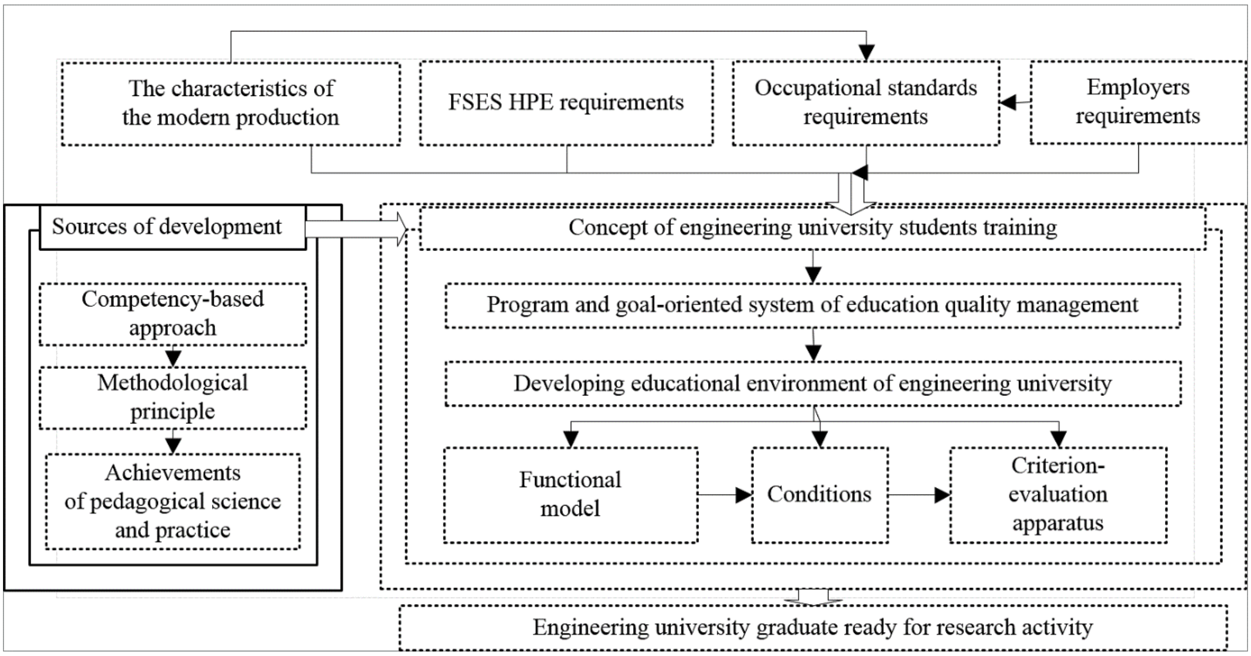

Figure 1. Structure of the students' research training

The concept content is implemented in the functional model of the students' research training being the basis for innovative didactics of engineering university and includes the following components: goal-oriented, motivational, informative, operational-activity, controlling-effective.

The implementation of functional models have contributed to the fact that:

- students motivation to research activities was formed, their subjectivity as active participants in the educational process on the basis of the general objectives acceptance and harmonization of interests of all subjects was developed, the atmosphere of productive activities was created;
- the education content was structured: integrative processes were implemented; special courses and practicums were included in professional training; special forms and means of extracurricular activities (field lab sessions and practical works, research tasks and projects performance, action groups work) were created;
- information technology, online learning resources were used, electronic system of the educational process Educon support was implemented;
- system of tasks (placed in Edukon) was developed and used, the students were focused on the ways of their solving during the teaching process and practice; integrated crosscutting research projects were used during course works and graduate qualifying works performance;
- conditions for development of reflection and self-control of students were created [29].

Efficiency assessment of the research training of technical universities students

Efficiency of the functional model is confirmed by the improving the technical education quality, namely: the formation of the graduates complex of competencies, research capabilities, functional skills of research as universal way of contact with the outside world, as evidenced by the results of experimental work (in the experiment 1520 people were involved, from them 1390 were students and 130 - teachers).

Effectiveness evaluation of the functional model required selecting criteria and indicators adequate to the task preset. As the components of research competence, we highlight as follows: cognitive, personality, and activity-related that we use as a criteria. In course of work, we determined that the level of the criteria of research competence formedness may be different and we made a scale of the combined assessment that took into account the mixed gradation combining two adjacent levels. Table 1 shows the scale of the combined assessment of research competence of technical universities students [28].

Table 1

The scale of the combined assessment of the willingness level for research activity (RA)

Level	Level characteristics	Correlation with the level of formedness
0	At least one component of willingness for RA is not formed	zero
1	All components of willingness for RA are at low	level
2	Three components of willingness for RA are at low level, one at higher level	
3	Two components of willingness for RA are at low level, two others at higher level	
4	One components of willingness for RA is at low level, three others at higher level	medium
5	All components of willingness for RA were formed at medium level	
6	At high level - one component of willingness for RA, at medium level - three other components	
7	At high level - two components of willingness for RA, at medium level - two other components	
8	At high level - three components of willingness for RA, at medium level - one component	high (advanced)
9	All components of willingness for RA were formed at high level	

At each stage of the experiment, the results analysis was carried out, analytical tables and histograms were filled allowing tracing the dynamics of changes. Table 2 shows the dynamics of the combined assessment of the students' research competence formedness in experimental and control groups at the beginning and end of the experiment.

Table 2

Combined assessment of research competence formedness, %

Combined level of willingness	Experimental groups		Control groups	
	input	output	input	output
Not formed (level 0)	95	1	94	6
Low (0 - 1 levels)	4	4	5	20
Below medium (2 - 3 levels)	1	4	1	26
Medium (4-5 levels)	0	40	0	32
Above medium (6-7 levels)	0	31	0	10
High (8-9 levels)	0	20	0	6
χ^2	172.8		79	

The results of experimental work show the effectiveness of the developed concept and implemented by means of functional model of the students research training. Data comparison of original and final assessments showed a stable growth of all components indicators among the students of experimental groups in comparison with the results the control groups. The results validity was confirmed using the methods of mathematical statistics.

Conclusion

The current stage of technical education development is characterized by highlighting the problem of students' research training that requires the technical education objectives and tasks rethinking, the formation of the conceptual foundations of the technical university educational activities. The research competence of the technical university graduate is defined as the research training objective.

The study of historiography of the technical universities students' research training problem made it possible to identify 4 stages; modern approaches are systematized, foreign and domestic experience is analyzed, the basic approaches to solving the problem of research training technical HEIs students are identified and developed. It was found that the existing approaches do not allow solving the problem of the research competence of technical HEI graduate formation in full scope.

It is revealed that engineering activity has an expressed research nature. Engineer interacts with the world through it as a subject and acquires the capability to change the world. The research nature of engineer's activities is manifested as leading one promoting its effective occurrence, being the basis of self-development and identifying the need for goal-oriented research training of students.

The concept of the students' research training in the context of competence-oriented technical education was created. This concept defines the research training as a basis for building innovative didactics of engineering university allowing implementing the requirements of the Federal State Educational Standards of Higher Education for the complex of professional, special, general cultural competencies formation.

The functional model of the technical university students' research training being the part of the concept and the basis for innovative technical didactics of the technical university was developed and implemented. The model is represented by a set of components: goal-oriented, motivational, informative, operational-activity, controlling-regulating.

The results obtained during experiment on evaluating the concept principles implementing by means of a functional model have confirmed its effectiveness on the development of students' creativity, motivation and value-based attitude to research, willingness to participate actively in innovative engineering processes, capability to develop new ideas, solving research production problems, and making innovative solutions.

Multicriteria Business Performance Evaluation

Abuzyarova M.I.
Ph.D. in Economics, Associate Professor, Samara State Economic University, Department of Management

Abstract

The effectiveness of entrepreneurial activity determines the relevance of the topic under investigation, since its methodological development neither meets the requirements of systemically reflective objective processes nor fully reveals their essence. An analysis of conceptual views on this issue highlights a divergence of topic-related theoretical positions. The purpose of the article is to develop the effectiveness of business development in the modern economy.
In recent years, this process has significantly accelerated, which is associated with the growing importance of entrepreneurship as the most important factor in increasing efficiency in the new business environment. Increased attention to the problem being investigated is due to the comprehension of the dominant role of entrepreneurship and the manifestation of specific features in market conditions. The main approach to the study of this problem was to assess the development of innovative entrepreneurship resulting from its unique properties. The research novelty of the study consists in the further development of the outlined directions and in a major contribution to research in the related field. The main results of the article will facilitate the development of a toolkit for approbation of the most progressive innovations aimed at increasing the efficiency of entrepreneurial activity and expanding their market positions in the domestic and international markets. Public authorities and management may make use of the main trends, patterns and mechanisms for the development of innovative entrepreneurship that were identified during the research project in order to enhance the sustainable development of the economic system in the context of increasing global competition and that of regional socio-economic development programs. The results of the research will foster the innovation activity of entrepreneurial structures, the development of practical mechanisms for the implementation of entrepreneurial functions and of ways and directions for their innovative use as well as the definition of a strategy for the innovative entrepreneurship development.

Introduction

Currently, the pace of economic growth depends on the extent to which the capital, an important element of which are the capital assets, is reproduced.

It should be noted that the accelerated renewal of fixed capital imposes stricted requirements on the technical level and qualitative transformation of all elements of the productive forces, whose implementation ensures an increase in economic efficiency and, basically, is accompanied by an expanding and updated range of products.

The study of the quantitative and qualitative characteristics of the increased production makes it possible to encourage the development of activities, proposals and recommendations.

To this end, a system of indicators needs to be implemented, which would determine the level, state and development of production intensification and detect the essence of its category [1].

Using this system allows a quantitative and qualitative disclosure of essential interrelationships of the various aspects of this process. Furthermore, it is necessary to assess the level, identify the reserves of growth in production intensification, determine factors affecting the production results and improve the incentive system.

In practice, however, the system of indicators has not yet been fully developed, which makes it difficult to tackle issues related to measuring the extent and the influence of factors on the economic efficiency of production.

The main reason for that is that the theory on production intesification is yet to be formulated and that the methodological issues concerning the formation of a system of indicators have not yet been solved.

An analysis of approaches adopted to deal with the above problems showed that different indicators are used to characterize production intesification. They mainly reflect the production process, the achievement of the economic efficiency of production, the comparison of results with the costs of production, the amount of expenditures of living and materialized labor per unit of time.

The study also stressed the lack of consensus among economists on production intensification and its outcomes. In addition, many of these studies are of theoretical nature and do not take into account information flows existing in economic entities.

Thus, the diversity of indicators and the inaccurate disclosure of the content point to an insufficiently developed theory, on the basis of which a system of indicators can be set up.

2. Review of Research Literature

The formation of a new quality in economy is a complex and multifaceted socio-economic process, which is reflected in the increased economic efficiency of entrepreneurship and determines economic development. Many Russian and international research studies deal with the economic efficiency of entrepreneurship. Increased economic efficiency was considered in the works by researchers such as V.I. Vybornov, N.V. Igoshin, T.V. Ryabushkin, V.G. Lebedev, V.A. Afanasiev, V.I. Maevsky and others [2].

Researchers such as A. Busygin, V. Kovalev, O. Efimova, J. Richard, and A. Gryaznova conducted research into the progressive economic development.

The stages, steps and cycles of economic development were examined by the following scholars: A. Shpitgof, G. Kassel, T.Veblen, U. Mitchell, J. M. Klark, J. M. Keyns, J. Hicks, K. Vicksell, E. Khansen, J. Schumpeter, N. D. Kondratiev, P. Samuelson, Zh. Shaekina, among others [3].

Despite the existing extensive research literature on economic efficiency, no study has focused on the economic performance indicators assessing the entrepreneurship complexity, the dialectical unity of the rates of change in levels (quality) and volumes (quantities) of economic efficiency indicators, types and systems of regulation with a view to ensure its rational development, the rate of their change (trends) in the stages and stages of the business cycle.

Developing the theory of economic efficiency is of great importance for the substantiation of managerial decisions to ensure the rational development of entrepreneurship.

2. Methods

The indicators pointing to the quality of joint commercial enterprise can be divided into basic, defining and binding ones.

As an example, the leverage of capital, capital productivity and labor inputs per 1 ruble of total capital are representative of the binding indicator.

The defining and basic indicators include the profitability of equity, the profitability of total capital as well as the profitability of sales.

Defining indicators characterize the adaptation of the development of joint commercial entrepreneurship to a changing external environment and the linking indicators are means for achieving goals.

Indicators of economic efficiency reflect the diversification of entrepreneurship in an economic entity [4].

Eeconomists developed various models to establish the qualitative aspect of the regulation system, which basically reflects reflects the system's qualitative aspect or its connection with the qualitative aspect of other systems [5].

Thus, K.A. Raitsky proposed the formulas □1□, which reflect the economic efficiency of both the intensity and rationalization of the movement in the reproduction of capital, and the use and consumption of production resources at the enterprise.

These include:

1. $Э^{1}_{п} = \frac{П}{К} = \frac{П}{Рп} * \frac{Рп}{Рп} =$ profitability ratio realized

products * return on assets.

2. $$Э_{n}^{1} = \frac{П}{Ип} * \frac{Ип}{Рп} * \frac{Рп}{Ч} : \frac{К}{Ч},$$

where $Э_{n}^{1}$ – generalizing measure of economic efficiency;

П – profit;

$И_п$ – amount of costs of production and circulation;

$Р_п$ – volume of products sold;

Ч – average number of employees;

К – capital (average annual value of fixed and current assets).

Here "the cost-effectiveness (profitability) is equal to the cost per 1 ruble of sold products multiplied by the productivity of labor of workers and divided by the labor-fund rate of labor of workers" [1].

Note that the formula (I) reflects the economic efficiency of production from the standpoint of the intensity and rationality of movement in the reproduction of capital.

The formula (2) indicates the economic efficiency of production in terms of of the use and consumption of production resources at the enterprise.

These formulas, however, do not reflect the interests of owners and entrepreneurs, which are important and fundamental.

These interests foster the production's establishment, functioning and development. Therefore, it seems necessary to investigate the economic efficiency of production from the perspective of changes in the return on equity.

Formulas (1, 2) take into account the volume of products sold resulting from the sale of products (services rendered, works performed).

It does not, however, reflect the totality of the workers' performance, which implies that the volume of sold products does not include the result of the realization of fixed assets used at the enterprise.

In other words, this volume is part of the total income [6].

The total income takes into account all forms and types of realization of the results of labor of workers and fully characterizes the final result of the movement in the reproduction of capital.

Other models belonging to this system also characterize its independent qualitative aspect. All of these studies show how to increase the volume of the system of indicators and to arrange the connections of some indicators with others as to determine the role and place of each of them in the system change. They were also used in the formation of the system being investigated.

To evaluate the economic effectiveness of joint (collective, group, etc.) commercial entrepreneurship, this study proposes the following formula:

$$J^{C} = J_{K}^{л} * J_{O}^{л} * J_{K}^{п} * J_{O}^{п} * J_{K}^{ч} * J_{O}^{ч} * J_{K}^{р} * J_{O}^{р} = J_{K}^{с} * J_{O}^{л} * J_{O}^{п} * J_{O}^{ч} * J_{O}^{р}, \quad (1)$$

where J^c - integral index of the change in the economic efficiency of joint (collective, group, etc.) commercial entrepreneurship;

$J_{K}^{л}$, $J_{O}^{л}$ - respectively, indicators of change in the level and volume of capital leverage;

$J_{K}^{п}$, $J_{O}^{п}$ - respectively, indicators of change in the level and volume of labor productivity;

$J_{K}^{ч}$, $J_{O}^{ч}$ - respectively, indicators of change in the level and volume of labor costs per 1 ruble of the total capital;

$J_{K}^{р}$, $J_{O}^{р}$ - indicators of change in the level and volume of profitability of sales;

J^{c}_{K} - index of changes in the level of return on equity.

The economic efficiency of joint (collective, group, etc.) commercial entrepreneurship in economic entities was estimated according to the formula (1).

For single-value estimates of the economic efficiency of joint business this study proposes to use the following formula:

$$I_C = \sqrt[5]{I_K^{\lambda} \cdot I_O^{\lambda} \cdot I_K^{П} \cdot I_O^{П} \cdot I_K^{Ч} \cdot I_O^{Ч} \cdot I_K^{P} \cdot I_O^{P}} = \sqrt[5]{I_K^{C} \cdot I_O^{\lambda} \cdot I_O^{П} \cdot I_O^{Ч} \cdot I_O^{P}} \qquad (2)$$

where I_C - the rate of change (index) of the integral index of economic efficiency of joint commercial enterprise;

$I_K^{\lambda}, I_O^{\lambda}$ - rate of change (index) of level and volume of capital leverage;

$I_K^{П}, I_O^{П}$ - respectively, the rate of change (indices) of the level and volume of labor productivity;

$I_K^{Ч}, I_O^{Ч}$ - respectively, the rate of change (indices) of level and volume of labor costs per 1 ruble of total capital (the ratio of consumption and accumulation);

I_K^{P}, I_O^{P} - accordingly rates of change (indices) of level and volume of margin on sales;

I_K^{C} - rate of change (index) of profitability level of owned capital.

In order to ensure the rational development of joint business, it is necessary to determine the following:

- which indicators that are included in the system grow;
- which ones decrease;
- the extent to which each increment increases;
- the extent to which each decreasing indicator decreases.

The solution of these problems requires an optimization of the parameters of the multiplicative effect of investment in the development of joint commercial entrepreneurship.

The model of this multiplier effect results from the following model of the development of joint commercial entrepreneurship:

y = b/c*(c+b)*d/b*(b+d)*E/d*(d+E)*a/E*(E+a)=a/c*(c+b)*
(b+d)(d+E)*(E+a), (3)

Where:

- a is the value of growth (decrease) in profit (net income) through investment, in thousands of rubles;
- b is the value of increase (decrease) in total capital through investment, in thousands of rubles;
- c is the value of increase (decrease) in owned capital, in thousands of rubles;
- d is the value of increase (decrease) in the cost of labor costs (number of employees, people), in thousands of rubles;
- E is the value of increase (decrease) in the total income, in thousands of rubles.

The stationary points of this multi-extremal objective function are of wavy-damped nature.

In practice, there are three types of stable changes in joint commercial enterprise:

- sustainable development,
- economic growth,
- decline.

Thus, a stable development is characterized by wavy-damped changes in the indicators that are part of the system, while the economic growth and recession are of wave-like increasing and decreasing nature respectively [7].

Each of them has an initial and final stage of stable development of joint commercial entrepreneurship. To ensure a stable change (increase, decrease) in the indicators included in the system, their parameters are to be used (Table 1).

These parameters were drawn from the stationary points of the multi-extremal objective function, which had been substantiated by the optimal nature of the change (increase, decrease) in the indicators included in the system. They can also be used in forecasting and planning the development of joint commercial entrepreneurship, as well as in substantiating activities undertaken for the development of the business entity.

In our view, the parameters of the multiplier effect on investing in the development of joint commercial entrepreneurship can be used to determine the profitability of an investment (external, internal).

Based on justified parameters of the multiplier effect, it is now possible to calculate the return on investment.

With the stable development of joint commercial entrepreneurship, the return on investment is 20% ($\frac{1}{5}c$:c*100=20%), but with the economic growth it growth to 60% (1 $\frac{1}{5}c$:2c*100=60%). The levels of this profitability correspond to the degree of complexity of the new quality and characterize the level of development of the country's economy. It is possible to use them to establish the directions and stages of the development of joint commercial entrepreneurship.

Table 1

Parameters of the multiplicative effect of investment in the development of joint commercial entrepreneurship.

Name of the model of a stable change in joint commercial entrepreneurship	Name of stage	The amount of change (increase +, decrease -)				
		Owned capital	Total capital	Total income	Number of employees (labor costs)	Profits (net profit)
Sustainable development	Final stage	c	$-\frac{4}{5}c$	$\frac{3}{5}c$	$-\frac{2}{5}c$	$\frac{1}{5}c$
Sustainable development	Initial stage	-c	$\frac{4}{5}c$	$-\frac{3}{5}c$	$\frac{2}{5}c$	$-\frac{1}{5}c$
Economical growth	Final stage	2c	$\frac{1}{5}c$	$1\frac{3}{5}c$	$\frac{3}{5}c$	$1\frac{1}{5}c$
Economical growth	Initial stage	0	$1\frac{4}{5}c$	$\frac{2}{5}c$	$1\frac{2}{5}c$	$\frac{4}{5}c$
Recession	Final stage	0	$-1\frac{4}{5}c$	$-\frac{2}{5}c$	$-1\frac{2}{5}c$	$-\frac{4}{5}c$
Recession	Initial stage	-2c	$-\frac{1}{5}c$	$-1\frac{3}{5}c$	$-\frac{3}{5}c$	$-1\frac{1}{5}c$
Note - The table has been compiled by the author						

The structure (interrelation) of the effects that are included in the system plays an important role in a regulatory system.

An increment (decrease) in equity leads to an increment (decrease) in the total capital, the total income, labor costs (number of employees) and profits [8].

These increments act as a multiplier effect resulting from the use of additional capital (investment) in the development of joint commercial entrepreneurship in enterprises.

The following formulas illustrate these relationships:

$K_1 = a/c$; (4.)

$K_2 = b/c$; (5)

$K_3 = d/c$; (6)
$K_4 = E/c$; (7)
$a = k_1 * c$; (8)
$b = k_2 * c$ (9)
$d = k_3 * c$;(4.65) $E = k_4 * c$, (10)

where^

- a is the increment value (decrease) in profit through investment, in thousands of rubles;
- в is the increment value (decrease) in the total capital through investment, in thousands of rubles;
- d is the increment value (decrease) in the total income through investment, in thousands of rubles;
- E is the increment value (decrease) in the cost of labor costs (number of employees, people) through investment, in thousands of rubles;
- c is the increment value (decrease) in owned capital through investment, in thousands of rubles.

These increments (declines) are closely related to the specific development of an economic entity that directly affects the change (increment, decrease) of the total capital, the total income, along with profit and cost of labor costs in economic entities [9].

These features can be taken into account using the coefficients, which are calculated according to the following formulas:

$K_п = П/C_{соб}$; (11)
$K_{сов} = C_{сов}/C_{соб}$; (12)
$K_д = =СД/C_{соб}$; (13)
$K_ч = C_р/C_{соб}$, (14)

where $K_п$ - coefficient of return on owned capital;
$K_{сов}$ - coefficient of capital leverage;
$K_д$ - return on equity ratio;
$K_ч$ - coefficient of labor force formation;
П – profit (net profit), in thousands of rubles;
$C_{сов}$ – total capital, in thousands of rubles;
$K_{соб}$ – owned capital, in thousands of rubles;
$C_д$ – total income, in thousands of rubles;
$C_р$ – labor costs, in thousands of rubles.

The following formulas determine the increment value (decrease) in the total capital, total income, labor costs, profits:

$Δп = a * K_п = K_1 * K_п * C$; (15)
$Δк = в * K_{сов} = K_2 * K_{сов} * C$; (16)
$Δд = d * K_д = K_3 * K_д * C$; (17)
$Δч = E * K_ч = K_4 * Kч * C$, (18)

where Δп is the increment value (decrease) in profit, in thousands of rubles;
Δк is the increment value (decrease) in total capital, in thousands of rubles;
Δд is the increment value (decrease) in total income, in thousands of rubles;
Δч is the increment value (decrease) in the cost of labor costs, in thousands of rubles.

These increments illustrate the multiplicative effect of making an investment into the development of an economic entity. It also corresponds to the degree of complexity of the quality of joint commercial entrepreneurship and takes into account the development of the business entity.

Based on our methodology aimed at optimizing the parameters of the investment's multiplier effect, we calculated the indicators characterizing the quality of joint commercial entrepreneurship

According to the optimal indicators, it is possible to regulate the development of joint commercial entrepreneurship, control, form and use a new quality in the economic entity [10, 11].

The actual values of the multiplier effect, however, do not correspond to the optimal ones, as shown by the reserves regulating the development of joint commercial entrepreneurship.

Importantly, the rate of change (trend) in levels and volumes of economic efficiency indicators should correspond to each other in steps and stages of the economic cycle and occur in a coordinated and synchronous manner.

An analysis of the optimization of indicators of economic efficiency of joint commercial entrepreneurship shows that it has significant reserves.

Consequently, the system of indicators, substantiated in this study and illustrating the complexity of quality, can be used in regulating and planning the development of joint commercial entrepreneurship in an organization.

Discussion

The essence and role of entrepreneurship in the economic development have have been the subject of research for over a century.

In different periods of the human civilization, social attitudes to entrepreneurship have changed.

An analysis of the essence and role of the entrepreneur showed that, throughout its history, entrepreneurship existed in various forms. In this connection, different definitions have been proposed of types of entrepreneurial structures.

An analysis of these approaches makes it possible to formulate their typology on the basis of signs: the historical form of occurrence; strategic and functional orientation; attitude to innovation; motivational consistency and the scope of activities [12].

Innovation is an inherent component of the entrepreneurial activity, which reflects its essence. At the same time, organizational innovations are no less important than industrial innovations. Obviously, five basic blocks of requirements are to be set down for the successful development of entrepreneurship: private property, economic freedom, economic incentives, competitive markets and limited government intervention.

As a rule, two models of entrepreneurship, the classical and the innovative ones, are distinguished.

In the first model, the entrepreneur seeks to organize work expecting to obtain a maximum return on resources.The second model is innovative entrepreneurship, which involves the search for new ways of enterprise development.

Nevertheless, any form of entrepreneurial activity should be of innovative nature.

Innovative enterprises, in addition to bringing the outcomes of research and technological activities to the state, make their use in the industrial sector possible and look for commercial partners [13].

In addition to small forms of innovative business structures, there exist medium and large organizational forms of innovative entrepreneurship. Small innovative enterprises have, in comparison with similar large entities, high chances of obtaining entrepreneurial profit.

Our analysis of the innovation activities of large organizations led to a number of general provisions representative of modern features of innovative entrepreneurship organization.

In terms of the organization of the innovation process in the firm, models of innovative entrepreneurship are singled out on the basis of the following:

- internal organization;
- external organization through contracts;
- external organization with the help of crowns [14,15].

One of the required conditions for the development of innovative entrepreneurship is the integration of small businesses into production complexes of large firms.

Partnerships in business can be grouped into four main areas of activity: cooperation in the sphere of production; cooperation in the sphere of commodity exchange; trade; and cooperation in the sphere of financial relations.

Another form of cooperation between small and large business is production cooperation.

The use of leasing (classical, financial, refundable, operational, leasing with full payment, leasing with partial payment, leverage leasing, leasing with additional obligations and net leasing) has considerable advantages. In addition, franchising can also be used as a form of partnership.

Entrepreneurial partnerships in financial relations can be reduced to factoring and commercial transfer. Thus, the development of small business directly depends on the opportunities for developing real production and the formation of close cooperation ties between small and large enterprises.

Conclusion

Entrepreneurship plays an important role in the economic development. It is economic efficiency that determines the direction of formation and development of an economic entity.

Despite this, research lacks on the economic efficiency of entrepreneurship, as confirmed by a significant divergence of opinions both on the essence of economic efficiency and on the formation of its criteria and indicators.

Progressive development of entrepreneurship in the economy can not be ensured without developing a theory of development, evaluation and optimization of its economic efficiency, without using specific criteria and indicators [16, 17].

At present, further research is needed to investigate burning issues in the economic efficiency of modern entrepreneurship.

The system approach plays a constructive role in the formation of systems of indicators in accordance with the degree of complexity of the quality of entrepreneurship. It makes it possible to reveal and examine in a more in-depth and comprehensive manner the interrelated changes in the complexity of the used quality of entrepreneurship as well as to determine the transitions from simple to more advanced quality.

Adopting this approach allows researchers to substantiate the types and forms of entrepreneurship, to adequately formulate the systems of indicators and development tasks, and to stimulate its development [18-21].

Continuous improvements are being made to indicator systems. On the one hand, they must be in line with the dynamic tasks of development, and on the other hand, to the methods for their solution. In an attempt to make indicators characterizing the development of entrepreneurship correspond to rapidly changing and more complicated solutions, methodologies and methods for their calculation need to be constantly updated.

To achieve the objectives of entrepreneurship and to adapt its development to the changing external environment, its economic efficiency indicators are defined as basic, linking and defining.

The basic indicators of economic efficiency facilitate assessment of means used to achieve the goal by determining indicators - the level of adaptation of their development to a changing external environment, and by linking indicators - the level of improvement of their organization [22-24, 29].

On the basis of ensuring that the rates of change (trends) of levels and volumes of economic efficiency indicators correspond to each other, types and systems for regulating the development of entrepreneurship.

Regulation methods include attracting investment, the intensity of capital flows, the use of resources, incentives for employees to work, consumption of productive resources and the implementation of labor outcomes. Being interrelated and based on an consistent expansion of these species, regulatory systems are formed in accordance with the types and forms of business development [25-28].

The long-term development of industrial entrepreneurship will contribute to the following. The development of industries can establish the production of competitive science-intensive products and the creation of new innovative productions. Specialized structures can be set up in order to ensure the development, implementation and dissemination of innovations. Sources and channels of long-term investments can be formed. Competitive and high-quality processing products can be manufactured using innovative technologies. Domestic products can be sold in the international market. Perspective systems of management of enterprise structures in the sphere of material production can be developed and implemented, as well as the information support systems for innovative developments and production. Finally, new branches of economy can be devised.

Abstract

The article aims at resolving controversial issues relating to the Adyghe and Circassian semasiology and word formation, namely, the structural and semantic content of the main root morphemes.

A comparative method and a method of internal historical-semantic and word-building reconstruction on the basis of language correlations were used.

The main result of the study, illustrated with the data obtained from the analysis of the Kabardino-Circassian and Adyghe languages, was to clarify the structure and semantics of root morphemes belonging to the period of the Circassian language community, which influenced the further development of the semantics and structure of the languages. The considered root morphemes are the basic structural-semantic units on the basis of which wide lexical nests of words are formed. Derived words are formed according to the law of regularity of semantic transitions of words connected by the unity of the root.

The main conclusion of the study is that the given root morpheme participates in the processes of compositional, not word-formation derivation, i.e. its formal and content aspects do not constitute an affixing formant.

Keywords: etymology, word history, internal reconstruction, derived stem, stem composition.

Introduction

It is a generally accepted fact that a significant part of Adyghe root morphemes are of the monosyllabic type “consonant + vowel”. The article presents different points of view of such scientists as M.A. Kumakhov, Kh.Sh. Urusov, A.K. Shagirov, N.R. Ivanokov, N.F. Yakovlev and others. The root morphemes considered in this article, according to some scientists, turn into affixes in the course of historical development, and serve as word-formation affixes. The article introduces new approaches to this problem and a new original solution. The purpose of the article is to: 1) conduct an analysis of the historical-semasiological development of lexemes, which go back to a single root morpheme, 2) study its semantic volume and its main vectors of semantic development on the basis of numerous linguistic data, presented in the form of tables in the article.

The etymology and semantics of root morphemes is an important issue; those relating to the derivation of the Adyghe languages are still open for investigation. A rather controversial issue concerns the original composition of the Adyghe linguistic units. Word-stemming process lies within the field of word formation and is related to another question, namely, whether the so-called complex affixes belong to the group word-formation units in the Adyghe languages. The solution of the questions is of great importance both in terms of theoretical comprehension of the problem and in practical application, since the results of this study can be applied in further studies on the etymology of the Circassian (Adyghe) words, Adyghe word-formation, practical grammar and morphology. The data obtained during the linguistic analysis will also contribute to

the development of historical-semasiological and comparative studies and Adyghe semantics in general. We believe that the topicality of the issue raised point to the timeliness and relevance of this scientific phenomenon for both general linguistics and the Adyghe language studies (Parvizian et al, 2015; Al-Qayoudhi et al, 2017; Nuriyev et al, 2018; Sears, 2018).
Such well-approved methods as comparative-historical and internal reconstruction were used for solving the issues. P.J. Hopper writes: "Methods of internal reconstruction and comparative-historical are used to restore the hypothetical stage of the relatively diffuse group of related languages (Hopper, 1988).
"The reconstruction of the semantic changes allows us to reveal the deep cognitive processes reflecting human thinking, as a human perceives and regulates the surrounding reality through his consciousness", L. Kh. Kharaeva writes in her study (Kharaeva, 2007).

Literature review

This issue raised is not new and has its own history, since many prominent scientists have covered it in their works. Nevertheless, it has not yet been unified. There exist absolutely opposite opinions concerning the issue. Some scientists believe that the structure of the ancient root "consonant + vowel" is characteristic of the so-called amorphous stage of language development (Yakovlev & Ashkhamaf, 1941).
N.F. Yakovlev's point of view is shared by the Dutch scientist A. Kuipers, who claims the following: "There are at least 600 two-segment units that do not split into single-segment morphemes, although there is good reason to believe that these cases date back to the compounds of such morphemes" (Kuipers, 1963).
A more complex structure of the ancient Adyghe root appears in the works by G.V. Rogava, who describes the Adyghe root as a complicated form due to the presence of prefixes and suffixes. For example, such words as –ne "eye", –pe "nose", –ie "hand" are secondary derived forms with affixes (Rogava, 1956).
M.A. Kumakhov presents a more reasoned point of view according to which the monosyllabic roots "consonant + vowel" refer to different periods of development of the West Caucasian languages, that is, the appearance of words such as –ne "eye", –k'ue "son", is chronologically heterogeneous (Kumakhov, 1981).
M.A. Kumakhov also differentiates some consonant groups –pse, pl'e, bgy, pliy (*псэ, плъэ, бгы, плIы*). This means that the monosyllabic roots of the morpheme can be represented by two-, three-letter morphemes, while 33 consonants –r, gu, gy, gyu, d, dzh, dz, g, zh, zhy, z, ku , kiy, ky, kyi, l, li, kh, khu, khy, ts, tsu, shyu, shi, schi, schiy, tsi (*г, гу, гъ, гъу, д, дж,дз,ж, жъ, жъу, з,к, ку, кIу, къ, къу, къI, къIу, л, лI, х, ху, хъ, ц, цу, шъу, шI, шIу, чI, чIъ, цI*) are not marked at the beginning of the root morpheme of the type "consonant + vowel" (Kumakhov, 1981).
Kh.Sh. Urusov believes that in the period of the Adyghe language community, only two vowels functioned in the language –y, e (ы, э), and roots consisted of a consonant and a vowel. Of the 1,300 such simple roots, according to the scientist's estimates, 270 end in e (э) (Urusov, 31).

Results

In our opinion, the abovementioned examples, where paired consonants are observed, can be decomposed into separate elements, which confirm the generally accepted fact that word-formation in the common Adyghe vocabulary was based on the "consonant + vowel" model. According to this, for example, the word "bgy (mountain)" (DKCL, 37) is divided into two components –by and gy. The element –gy means an object above the flat area/line. Monosyllabic consonant groups are characterized by the loss of vowels y or e. A special feature of the Adyghe word-formation is the presence of a semantic meaning for each syllable "consonant + vowel".
The "Grammar of the Kabardino-Circassian Literary Language" admits the fact that "The overwhelming majority of affixes in the phonetic aspect are not different from words ... they go back to independent words in the past". We consider it controversial that the majority of root morphemes belonging to the "consonant + vowel" type have turned into affixes in the course of development. It is worth mentioning, that in the Grammar the root mentioned is once considered to be a root "consisting of three or more sounds, which is a combination of the primary root and the dead affixes", for example, badze "fly" and the lexical unit bzhen "goat" are assigned to monosyllabic words with a suffix that has lost its meaning (Grammar, 1970). The first word, from the point of view of modern word-formation in the Kabardino-Circassian language, cannot

really be decomposed into parts, which does not negate the fact of the etymological fusion of the two roots be/y + dze, where the first component means "something above the flat area/line, i.e. to fly", and the second one means "army", which eventually gives the "flying army" semantic meaning, where both roots are from the general Adyghe. In the second example, G.V. Rogava identifies a class indicator –b, the root part –zhe and the determinative suffix – n. (the quote from Urusov, 32-33) We consider it logically justified to see two roots in the meaning "something higher than the flat area" and zhe/y "to run", which in total gives the meaning "running in the mountains". The element zhe can be compared with the root of the azhe "he-goat" (DKCL, 1999).
The authors of the article agree with the opinion of some Caucasian scholars, including N.T. Gishev, who writes: "In the modern Adyghe language there are lexemes, which include related roots, once existing as independent words. Some of them still retain their semantics transparently, while others completely lost their original meanings" [Gishev, 2008). In contrast to the opinion of the above-quoted author, we do not consider his statement about the loss of meaning to be correct. In our opinion, it is the chronological periodization which points to the appearance of certain root-sounds. As M.A. Kumakhov writes, "the most significant achievement of comparative-historical linguistics, in our view, is the introduction of the principles of chronological hierarchy of the studied reconstructed phenomena". A comparative analysis of Adyghe and Kabardino-Circassian lexemes is not sufficient to restore the meanings of the common-Ubykh, and especially the common-Abkhaz roots. In the same work, the author decomposes the lexeme Iebzhane (*Iэбжъанэ*) "fingernail" into Ie (*Iэ)* "hand", bzh'e "horns" and ne "place" (Kumakhov, 1984). Without describing the other components of the word, one cannot be sure that bzhe is an indivisible unit that consists of a –by "higher than the flat area", since the shape of the nail is not flat, but anyway it fits into in the meaning "something above the flat place" as well as zhye "mouth" as the shape that is created between the pads of the finger and the tips of the fingernails is associated with the mouth. The fact that the element –by has a meaning of height was noted by N.T. Gishev himself in the same work (Gishev, 2008).
The solution of the problem should be found in the analysis of the sound composition of the Adyghe languages. The Kabardino-Circassian alphabet is represented by 59 signs. Almost all sounds in conjunction with the vowels y and e have their own lexical meaning, with the exception of the vowels (a, e, y), two signs that do not have a sound (*ъ, ь*), diphthongs yo, iy, eu (*ё-йо, й-йы, о-эу*), back-lingual k (к), occurring only in the borrowed words, the sonorous r (р). Even the vowels e/ye0 (*йэ*), and iy (*иы*) have lexical meanings, respectively, "bad", "to coat with clay". Thus, in the Kabardino-Circassian language there are 49 letters, with the help of which the words represented by structurally root morphemes "consonant + vowel" are constructed. We are not talking about the archaic nature of a given number of letters in their modern sounding, this is just a fact confirming the existing opinion that the Kabardino-Circassian word formation has not lost the form of word production inherent in the Abkhaz-Adyghe languages. It is believed that such syllable sounds, i.e. 98 units in the Kabardian-Circassian language, became the basis of the lexical composition of the language, which can be divided into aboriginal Abkhaz-Adyghe, Adyghe, and Kabardino-Circassian. These sound-syllables have received a further semantic development in derivative words as a result of word-formation processes. For example, k'uy (*къуы)* 1. Something dry, solid; kudame (*къудамэ)* "tree branch" (DKCL, 474); 2. The angle of something is kuape (*къуапэ)* (DKCL, 471); 3. Beat somebody - kyu (n) (*къуы(н))* (DKCL, 476). The root k'ue (*къуэ)* was developed in the following meanings: a channel, a ravine, a son (DKCL, 471; 1999).
Several dozens of simple roots form the basis for the formation of complex words consisting of two or more elements and followed by units that have categorical meanings of direction, location, capacity, etc., which have received the status of prefixes and suffixes in modern grammar. The transformation of a compound word component into an affix occurs only if the given element, an independent word, ceases to function outside the composite. The transformation of an independent word into a prefix occurs when a word, joining a number of notional words, begins to express signs or relations of a categorical, that is, a very abstract character (Shteinberg, 1976).
The analysis shows that the Adyghe root words are divided into two types initially - monosyllabic words with a vowel -y and monosyllabic words with a vowel -e. All derived words form large etymological nests,

in turn, consisting of numerous word-forming nests. Root morphemes have different primary meanings that are manifested in derived words.

Our study is devoted to the analysis of the root morpheme, which belongs to the category of monosyllabic roots under consideration. It should be noted that the root morpheme is used as an independent unit in the Kabardino-Circassian language, whereas in the Adyghe variant it has its own lexical meaning –by "hole, lair". However, the root –by is present in the derived Kabardian-Circassian words, from which it is freely isolated as a structural and semantic element. For example: kumb (*кумб) meaning* "pit" (DKCL, 329) is decomposed into ku and by (ku - center, middle + m (phonetic accretion) + b (y) pit = in the center of the pit); l'emb (*лъэмб)* (DKCL, 495) meaning "footprint" (lie - leg + m (phonetic accretion) + b (y) pit) = feet of the pit); l'embyatI (*лъэмбытI)* meaning "two footprints" (DKCL, 496) (l'e leg + m (phonetic accretion) + b (y) pit + mI (y) two = two legs of the pit); g'uemb (*гъуэмб)* meaning "hole" (DKCL, 102) (g'ue – hole, nest + m (phonetic accretion) + b (y) pit); byrk'ueshyrk'ue (*быркъуэшыркъуэ)* meaning "uneven, bumpy" (DKCL, 54) (by - pit + p (phonetic accretion) + k'ue "the lowland between the two heights" + shy "carry" + r (phonetic accretion) + k'ue "the lowland between the two heights"), l'ebyshe (*лъэбышэ)* meaning "clumsy"(DKCL, 493) (l'e - leg, foot + by "pit"+ "take away", compare Iush (yn) (*Iуш(ын)*) "take sb away" (DKCL, 851), and the etymologized word literally sounds as a "footprint, diverted to the side", i.e. not the way it should be); byrtiym (*быртIым*) meaning the "full, fat, overweight" (DKCL, 54) (by "swollen"+ r (phonetic accretion) + tiy "something soft", compare bykh'utie (*быхъутIэ) "*short fat man" (DKCL, 55), where by "swollen" + kh'u "round" + tie "something soft" + m here is associated with the same element as in the Iesthtym (*IэштIым)* "fist"" (DKCL, 834), tiamy *(тIамы) "*orange"" (DKCL, 642)), byrybyn *(бырыбын)* meaning "become fluffy" (by "become swollen" + r (phonetic accretion) + reduplication of the root by + n (the index of infinitive in the modern Kabardian-Circassian language)); bykh'u (*быхъу) "*wide" (DKCL, 55) (bykh'u "short fat man", where by means "swollen" + kh'u "round"); byiuebyshe (*быIуэбышэ) meaning "*ugly" (DKCL, 55) (by "going away from the straight line, regardless of the decrease or increase" + Iye / Iuy "the beginning, the original line or point" + by "going away from the straight line, regardless of the decrease or increase"+ she "to carry", literal meaning: away from the original line); schiembrye (n) (*щIэмбрыуэ(н)) "*dive" (DKCL, 803) (schie "bottom, under" + m (phonetic accretion) + b (y) "deepening formed on the water in the performance of this action" + r (phonetic accretion) + ye "striking", literal meaning: lead down / under, forming a deepening by striking).

In separate words such as byrgu-syrgu (*быргу-сыргу)* "bang bang" (DKCL, 54), birkshyrk (*быркъшыркъ)* "noise" (DKCL, 54), the element under investigation can act as a part of the onomatopoeic unit. It should be noted that all the above mentioned complex words are motivated with a transparent internal form. Even onomatopoeic words are partially motivated.

The etymological meaning of the word, which determines the initial semantics of the root in the Adyghe language, allows us to represent the complete or partial image of an object, its specificity, if it is a noun or an adjective, and also an action, if it is a verb.

The abovementioned approach helps to clarify the semantics of the root, the representation of the images of objects, which can be demonstrated in the following example: kumb "pit": ku "middle" + by "hole", container - a deepening on a flat surface. We also find the same root in the derived word bybyn (*быбын)* meaning "to fly" (Tharkakho, 663), preserved in the Adyghe variant, whereas in the Kabardian-Circassian there is a verb l'eaten (*лъэтэн)* (DKCL, 499) in the same meaning. The last verb is decomposed into l'e "leg" and you ty "to lift", in other words, the literal meaning of the verb is "to raise one's legs". At the same time, the common Adyghe root would be a part of the Kabardino-Circassian lexical units such as: byrybyn "become fluffy", sheryb (*шэрыб)* "bubble" (DKCL, 759), beten (*бэтэн) "*grow stout, fatten" (DKCL, 36). The image of a swollen object can be represented as an "inverted pit". Thus, single-root words denote opposites. In our opinion, there is no doubt that the formant b(y) in the composite nybe (*ныбэ)* "belly" (DKCL, 542) is inseparably connected with the meaning of the root morpheme -by "bubble". This conclusion is confirmed by the fact that the intestines of the slaughtered cattle are called *nybe*, which correlates with the sheryb "bubble", as well as b(y) in the bagyn (*бэгын)* "become swollen" (DKCL, 34). Let us also compare the Kabardino-Circassian verb tebyben (*тебыбэн)* (DKCL, 615) meaning "to fly over something". Our reasoning can be supported by the etymological analysis of the Adyghe words, conducted by N.R. Ivanov, who

believes that such ethnonyms as abaza, Abkhaz, Abadzekh have an element -by meaning "higher place, mountain" (Ivanokov, 2015), which is confirmed by the data of the conducted research.
The word abg'ue (*абгъуэ)* "nest" A.K. Shagirov divides into two parts: the composite ne "eye, hole" and b'gue "wide", comparing it with the Adyghe nabg'ue (*набгъуэ)* (Shagirov, 55). As in other examples with the element -by, one of two basic meanings is present: "something above the flat area" or "something below the flat area". If one draws a line and presents the gyoumb (*гъуэмб*) "the hole; something that is below the flat area", once can also get its opposite meaning - abg'ue "nest; something that is above the flat area". With the decomposition of the word schabe (*щабэ)* "soft", A.K. Shagirov associates –be/y with the same element as in the ubyn (*убын*) "to pound", and with –scha as a part of the word scheschen (*щэщэн)* "become small pieces" (Shagirov, 1977), which seems unlikely to the authors of the article. This word (schabe) is decomposed into a sche, which goes back to schy and is found in the word schyn "to rot" (DKCL, 789), logically based on the fact that all that is rotting becomes soft, and its full semantic meaning is translated as "to rot a lot".
Such a semantic development of the root can also be observed in other languages. If one looks at the comparative dictionary by M.M. Makovsky, one will see that the meaning of a pit, a den, corresponds to numerous images. Any hole (abyss, pit, hole, door, window, vessel, skull) has a double symbolism: this is the point from where everything happens, and the place where everything comes back. In particular, words with the meaning of the "hole" correspond to the meanings: breathe and dig, soul and intestines, outer and inner, abyss and stars, top and bottom, beginning and end, good and evil, birth and death, emptiness and way, etc. All these meanings and connotations are based on the oldest anthropomorphic model of the universe (Makovsky, 1996).
Other language examples show that the root –by can develop opposite values, which can also be reduced to the meaning "something not flat". For example: 1. l'emb (*лъэмб)* A footprint imprinted on the surface of something. 2. Deepening (drawing of a foot); l'embyti (*лъэмбытI*) step, literally "two footprints" from the l'emb *лъэмб* and the tiu (*тIу*) two. In the word k'uebaebzhabe (*къуэбэбжьабэ)* "with an uneven surface" (DKCL, 471) there is a reduplicated root of -be with an entirely different semantics. The root -be historically goes back to the sound complex -by. Having decomposed the actualized word into elements, we get the following: k'ue (*къуэ)* ravine + be "many" + bzhe "sheer drop" + be "many". The etymological and structural analysis of this word makes the following assumption possible. One part of the composite, namely bzhe sounds like bzhap "hill" in the Adyghe language (TSAYA 59), which splits into two minimal components - by+ zhe where -by means "rising part of something", and zhe "narrow part". For comparison, let us introduce the Kabardino-Circassian variant bgyzhye *(бгыжьэ)*, which means the narrow mountain area (DKCL, 37). Such lexemes as byrkueshyrkue (*быркъуэшыркъуэ)* "uneven, bumpy" in Kabardino-Circassian and byrg-tiyrg (*бырг-тIырг)* "uneven, bumpy" (Tkharkakho, 2004) in the Adyghe variant contain the root morpheme meaning "going down" like in the words kumb "pit" and, g'uemb "hole". Here are some more examples with the given root: be "many", bakiy (*бэкIы)* "of many years" (TSAYA, 84) (be "many" + kiy "grow"); batse (*бацэ)* "shaggy, furry" (DKCL, 34) (be "many"+ tse "fur, hair"), bedzh (*бэдж)* "spider" (DKCL, 34) (be "many" + dzh (y) "weave"), beg'uen (*бэгъуэн)* "multiply" (DKCL, 34) (be "many" + g'ue "dry", i.e. "revival of what was not alive, what was dry"), bev (*бэв)* "rich" (mainly about the crop) "(DKCL, 34) (be "many"+ vy "to plow"), the bashie (*бащIэ*) "workaholic" (TSAYA, 43) (be "many"+shie "do"), the baio (*баIо*) "talkative" (TSAYA, 49) (be "many" + iue to speak"), beby (*бэбы*) (TSAYA, 82) "a thick pole serving as a lever for lifting weights" (be "many" + by "above the flat area", literally meaning "many times over the flat area", which fully corresponds to the subject), g'able *(гъаблэ)* "infertile, hunger" (DKCL, 83) (g'e "year"+ be "below of what should have been"+ le "layer, volume", comp., zale (*залэ)* "the width of an index finger", (DKCL, 185), tiuale *(тIуалэ)* "the top, width of two fingers" (DKCL, 644), etc.), in the following three examples, we isolate the root -be in the opposite meaning, namely, "decrease, lessening" – ibe (*ибэ)* "orphan" (DKCL, 308), fyzabe (*фызабэ*) "widow" (DKCL, 668), liyg'uabe (*лIыгъуабэ*) "widower" (DKCL, 505). All three meanings have the connotation of the absence of integrity - an orphan without parents, a widow without a husband, a widower without a wife.
As for the stem chiybe "to drown in the water". Bersirov writes that "-be is an intransitive verb with a bound stem. It is manifested with the help of the preverb of the place Chie (Bersirov, 26). The author also notes that this lexeme is not marked in Kabardian (Bersirov, 26). Indeed, Chiybe (*чIэбы)* or (Schiybe) *щIэбы* do not

function in Kabardinian, but this stem –be can be found in the word Schiembryuen (*щIэмбрыуэн)* "to dive" [DKCL, 803], which is decomposed to Schiye (*щIэ)* "bottom, under" + m (phonetic accretion) to + -by "something below the flat area (i.e. , which is formed on the surface of the water after a person dives there) + ue "to hit", which literally translates "to go under the water hitting, creating something below the flat area". The author singles out the second stem root -be in the examples jebedshy (*йэбэджы)* "falling", the tyreuyiube (*тыреуыIубэ) "covering"*, but does not offer a variant of its meaning (Bersirov, 2001). In both examples, the suggested values of this root are preserved in this study: je-be-dzhy *(йэ-бэ-джы)*, whose meaning can be referred to as "something deviated from the line", i.e. if something or someone falls down, then it / it bounces off the trajectory that was considered given.

Thus, analyzing the root morpheme as part of numerous derivatives on Adyghe linguistic material, we come across a linguistic phenomenon, such as enantiosemy. Enantiosemy is characteristic, according to scientists, for all levels of language. The formation of a particular dictionary unit of different and even opposite meanings is widely known and observed in all languages.

In this study, we will talk about the manifestation of enantiosemy at the lexical level. The reasons for the emergence of lexical units that contain opposite meanings in their semantic structure are the following: the dualism of human thinking and the asymmetry of the linguistic sign. In the language, these laws are manifested at the level of etymology, the semantics of the primary meaning of the root, which is characterized by diffusivity or polysemy. The causes of enantiosemy lie in the weakening of the original meaning of the word in favor of its polarization in the form of opposite meanings, confined in the same linguistic form. This process consists of two phases - desemantization and enantiosemy. In the process of formation of opposing meanings, various factors are involved in one language form - objective ones, reflecting the surrounding reality and subjective, conditioned by individual cognition, which can enter contradictive relations (Kharaeva, 2007). In the process of enantiosemy, the language tries to find a solution to these discrepancies. Proceeding from the general principles of the formation and functioning of linguistic signs, we can derive certain regularities in the evolution of the linguistic unit, but at the same time, we should give an account of the fact that language as a sign system is inherently poorer than the surrounding world, which cannot be subjected to overall analysis. As a result, any linguistic sign existing in a discrete form is more "narrow" than "the signified". Thus, enantiosemy is a manifestation of the asymmetry of a linguistic sign or in other words a discrepancy between form and content, therefore it can be said that it is an element of a "single compensatory mechanism regulating the growth of the semantic and formal diversity of a language" (Patinioti, 2004).

Enantiosemy is the linguistic expression of the duality of human cognition, a general law, according to which a single can be divided into mutually exclusive opposites, between which relations are established. The category of opposition exists in the opposition of statement-negation. The primary meaning of a language unit can be either positive or negative. The paired existence of two opposites in the linguistic system is logical and is due to the significance of the linguistic unit, which is determined, firstly, by what it represents itself, and secondly, by what it is opposed to. Therefore two sides of the opposite become independent. Enantiosemy associated with the categories of negation, modality, expressiveness and emotionality, becoming a means of expressing the speaker's attitude to the environment, appears at the pragmatic and communicative level (Kravtsova, 2006).

The main reason for the development of opposing meanings in one linguistic form (semantic antonymy) is laid in the undifferentiated character of the root basis of the word, its etymon, which leads to the appearance of opposing meanings. The generalized syncretic nature of etymological meaning, which is the result of reflecting generalized ideas about the world, provides an opportunity for the opposite semantic development (Markova, 2010).

As we see from the illustrative material, the various meanings of the root morpheme of an independent word that has become part of the derived composite word often leads to an antonymy of the actual element that has become a formant of various words during derivation or development of other meanings.

Thus, the development of the root morpheme could be schematically shown as follows:

Table 1

By			
Something above the flat area	Something below the flat area	Something compact	Onomatopoeia
БыIуэбышэ «ugly»	*Ебышэ* «to slope»	*Быдэ* «strong»	*Быргуэ* «the sound of a falling object»
Быркъуэшыркъуэ «uneven, stumpy»	*Гъуэмб* «hole»	*Убэн* I «to make something compact»	*Быргъын* «to make a sudden sound»
Быбын «to fly away»	*Кумб* «pit»	*Убын* II «to gossip»	*Быркъ* «the sound of a metal or solid object on something solid»
Бырыбын «to become fluffy»	*Лъэмб* «footprint»	*Убэрэжьын* «to beat»	*Бым-сым* «boom»
Быдз «woman's breast»	*Абгъуэ* «nest»		*Быргу-сыргу* «bang bang»
БыхъутIэ «short fat man»	*ЩIэмбрыуэ* «to dive»		
Ныбэ «belly»			
Шэрыб «bubble»			

All these words differ in one feature, namely the location of the root stem -be. Its meanings "below/above the flat area" are present in the initial, middle and final positions of the derived words. Structurally, the root morpheme can stand in the middle of the derived word and in the final position.
As for the semantics of derived words, all their meanings go back to the original initial meanings of the root, which are the starting point of the semantic evolution, in other words, there is a certain dependence of the derived meanings on the meanings of the etymons (Kharaeva, 2007). The semantic development of the root consonant groups is systemic. Systemic relations arising between words derived from a certain root morpheme affect the qualitative certainty of the derived units and, accordingly, their derived meanings.
In our opinion, the root morpheme -be is a derivative of –by, since it correlates to it in its meaning. One of the initial meaning of –by is "to expand, increase or decrease in quantity" and this meaning served as the basis for the main meaning of -be. Further development of the root morpheme –be is schematically represented as follows:

Table 2

Be	
To multiply, which goes back to the meaning of –by (over the flat area)	To decrease, which goes back to the meaning of –by (below the flat area)
Бэ/бэ «many»	*Ибэ* «orphan»
БэкIын «of many years»	*Фызабэ* «widow»
Бацэ «furry»	*ЛIыгъуабэ* «widower»
Бэдж «spider»	*Бгъэ* «infertile»
Бэгъуэн «to multiply»	*Гъаблэ* «hunger»
Бэв «rich (meaning abundant)»	
БащIэ «workaholic»	
БаIуэ «talkative»	
Бэбы «bar, lever»	

All scientists who dealt with Kabardino-Circassian and general Adyghe languages agree that -be means "abundance, many things", but in the Grammar the element -be is referred to as a suffix -be forming words from the noun stems (Grammar, 84), which cannot be accepted because of both high usage of this unit and opposite meanings, as well as its separate use in speech in the same sense, i.e. "many"". In the same

Grammar, the -tse element is considered to be an unproductive word-building suffix with the meaning "having a lot of something" (Grammar, 97). The meanings of the batse (*бацэ)* "shaggy, furry" and tsybe (*цыбэ)* "hairy" (DKCL, 34, 747), where –be means "many" + tsy means " hair and fur", and variety of permutation of components show that the element -tse can be regarded as a suffix.
Our study correlates with the theory of morphological categories in synchronism and diachrony of J. Bainby, who denies the "arbitrary" nature of linguistic elements (even in morphology, which was traditionally considered to be the bunch of arbitrary and idiosyncratic). The scientist destroys the structuralist morphological theory, according to which the morphological facts, along with the phonological facts, represent an autonomous system of significant oppositions, where the regular (grammatical) goes along with the irregular (lexical). J. Bainby considers the main task of the study to be the search for cognitive-psychological explanations for the general properties of morphological systems observed in different languages. The most revolutionary thesis of the researcher proclaims the fundamental interconnection between the expression plan and the content plan. In the morphological structure of the word forms, the semantic properties of the morphemes entering it, which are related to the relevance scale, are directly iconic. By relevance, the scientist understands the degree of change in the meaning of one morpheme (primarily, the root) under the influence of the meaning of another morpheme (first of all, the affix) (Kharaeva, 2007), but according to our theory affixes or "dead" affixes are ancient roots that have lost their productivity.

Discussion

In conclusion it can be suggested that the word-formation processes, procedural moments of semantic evolution and nomination in the Adyghe linguistic space have their own peculiarities, determined by the worldview of the ethnos, its linguophilosophy. This feature is that some elements of the root morphemes erroneously refer to affixes, since they represent independent parts of the compound word with their own semantic meaning. Although there is a firm belief that many prefixes in different languages are independent words, prefix formation is sometimes referred to as word-building. In the course of our research, based on the analysis of all the lexemes mentioned, we found that the root morpheme be / by is in two main positions - preposition and postposition. It can be concluded that the same element cannot be both an affix and a suffix. Consequently, it should be recognized that derived words of a given type with an element of be/by are the result of compositional, not prefixal word-formation.
The semantic development of the stem root or the ancient root is closely related to word formation. When it comes to word-formation enantiosemy, they mean the multi-task and even the polarity of the values of root morphemes and affix formants.
The questions of semantic and word-formation enantiosemy on the material of the Kabardino-Circassian language have not yet been systematically analyzed, since they represent a certain complexity and ambiguity of the solutions. The analysis of the linguistic material allows us to make some generalizations and conclusions, namely, that the nature of the primary basis of the word includes the possibility of an opposite development of meaning, and on the basis of opposite meanings, different vectors of semantic evolution are born. Some features of objects, different actions and their results can be polarized in meanings.
All this variety of semantic evolution, its multi-tasking is the result of the cognitive activity of a person who, in the process of cognition of reality, names its segments, giving them different characteristics and evaluation.

The conclusion

Our conclusions are based on general theoretical and particular laws of Circassian linguistics, namely the systematic character of the semantic development of the Adyghe lexemes, which go back to a single root basis, and the regularities of the Adyghe word formation and word-compounding. Several stems gave rise to the formation of numerous lexeme derivatives with various meanings, the semantic reconstruction of which leads them to the root consonant monosyllabic types like "consonant + vowel".
Our study was confined to only one monosyllabic root group -by/be. As we have already noted, such consonant root groups, consisting of a consonant and a vowel, are widely represented in the Adyghe

linguistic space. The suggested assumption that these root groups are involved in the processes of compositional, rather than derivational derivation, namely, that they are not formal elements in word-formation, require further verification on a broader illustrative material, which shows the prospect of further scientific research, seen in the analysis of other root morphemes of the type “consonant + vowel”.
The data of the conducted study may be of interest and useful for further research in the field of semasiology and word formation in the Caucasian languages, and especially in the studies of the Adyghe language, as well as in the theory and practice of lexicology, morphology, etymology and grammar of the Adyghe languages.

Abstract
The paper deals with modern theories of globalization. Based on the studies representing the transformists, this work reveals the interrelation of the globalization and localization processes. The authors give definition to the economic component of localization, highlighting its criteria and factors. The interdisciplinary nature of globalization and localization is also shown. The conclusion is that the contradictory development of the modern economy is manifested, on the one hand, in the involvement in globalization, and on the other, in the desire to preserve national identity through economic localization. There are three stable trends that confirm this conclusion. They are the desire of to diversify import flows, preventing the prevalence of products of one country; reducing the influence of developed countries on individual regions, if their impact on the economic life of the territory ceases to be decisive; and increasing the role of regional leaders, influencing the economic situation in the region. Thus, the task of coordinating the economic security policy and development of trade and economic cooperation with a number of countries on mutually beneficial terms is becoming relevant in Russia.
Keywords:post-classical paradigm, globalization, localization,glocalization, interdisciplinary approach, economic security, macro- and mega-levels, integration associations.

Introduction

An important regularity of economic relations developing in modern world is globalization. There are deep contradictions in this process, since the ever-closer involvement of individual countries and territories in the single world economy not only contributes to their socio-economic development, but also has very negative consequences, including threats to their economic security. To minimize these threats, each state, based on its own characteristics and capabilities, determines its ways to preserve and strengthen their economic security, mobilizes the entire range of available resources to ensure economic growth and improve the welfare and living conditions of its citizens.

Meanwhile, no approach to understanding the nature of economic globalization and localization, their nature and impact on the economic security has not yet been found. It greatly hinders the formation of an adequate economic policy. In modern settings, the steps taken in practice are not always consistent and indisputable and not always bring the desired results, as well as the strategies adopted at the state level do not always find a real implementation.

Materials and methods: The post-classical paradigm is a new scientific thinking, in which the boundaries between the sciences disappear. It implies an interpenetration of theories, approaches, terms, and concepts, where a special role is played by the coexistence of social and natural systems. This interpenetration of natural science and humanities provides a more comprehensive understanding of the modern interconnected world. Globalization is one of these modern integrated interdisciplinary concepts.

Currently, the phenomenon of globalization is the focus of research of various fields of science. The increasing number of Research of the globalization development processes in economic management, international relations, financial market, culture, ecology, etc., was observed since the mid-1990s. A range of authors like I. Wallerstein, R. Robertson, M. Featherstone, M. Waters, A. Appadurai, A. Utkin, A. Chumakov, E. Kochetkov, A. Zinov'ev, and others are the well-known leading theorists in the field of globalization.

Modern globalization theories have emerged on the basis of many scientific studies, which are divided into five quite different areas, developing from the middle of the 20th century[1] (Table 1):

Table 1. Directions as a bases for the globalization theories

Direction of research	Major representatives	Basic ideas

Research of management	J. Rosenau, R. Keohan, J. Nayt, et al.	Phenomenon of multinational corporations. Optimization of production by placing it in different countries
Research of social and cultural theories	N. Adorno, M. McLuhan, E. Giddens, D. Harvey, etc.	Theories of space-time compression. The impact of mass communication on the transformation of society and social relations
Research of the biosphere	A. Pechchei, J. Forrester, D. Medouz, early works of K. Jaspers, E. Leroy, and others.	Global modeling. Exhaustibility of resources, the idea that humanity exists together in an insurmountable proximity to each other
Research of international relations	A. Frank, S. Amin, I. Vallerstayn, J. Arrigi, etc.	World-system theory. Dividing countries into developed and developing, introducing modernization (Westernization) institutions in the third world countries
Economic research	E. Toffler, F. Fukuyama, A. Touraine, D. Bell, J. Baudrillard, et al.	Concepts of post-industrial society, postmodern, third wave. Influence of new technologies on industry, structure of social relations and values

Modern theories of globalization, which are now particularly relevant, were formed on the basis of the selected areas. There is no doubt that globalization is a multidimensional process. Modern researchers deal with many manifestations of globalization from the globalization of the financial market to the relationship between globalization and the digital economy. The authors believe that insufficient attention is drawn to the nature of relations between globalization and localization, which in modern conditions has acquired particular relevance.

Results: To order the approaches in this analysis, the authors used the classification proposed by British political scientist D. Held [2]. It says there are three directions in which the relationship between globalization and localization can be traced: hyperglobalists, skeptics and transformists.

Hyperglobalists believe that the traditional nation state is unnatural, and globalization is a new era in the history of mankind. It should be noted that both hyperglobalists and skeptics take the state economy as the basis for the analysis. On the basis of works of J. Rozenau, P. Diken, V. Grayder, A. Jons, K. Omae and others, it can be concluded that the single global market exists. Hyperglobalists speak of an era without national borders, where nation states appear as transfer stations in a chain of global logistics flows of capital and goods. At the same time, there are two different groups of hyperglobalists: the first one follows the logic of neoliberalism (theory of T. Couen), the second follows the traditions of Marxism (theory of S. Latosh). That is, there are ideological contradictions among hyperglobalists, but they also have a common basis – economic interests are at the heart of globalization, where economic globalization creates a new system of winners. It includes a transnational class of managers, specialists in finance and information technology.

Hyperglobalists note changes in national culture: the consumerism ideology is spreading and forming a new identity, universal values and lifestyle. Proponents of this theory introduce such concepts as global civilization and global community.

Summarizing the views of hyperglobalists, one can distinguish a common feature: all authors consider the modern world as a single global market, global civilization and global civil society, where there are no local borders, and the national culture is gradually disappearing [3].

Another position, opposite to hyperglobalists, is the position of skeptics. The theory of the world-system analysis by I. Wallerstein, which is still popular in analysing the system of modern international relations. According to this theory, the basis of the modern world system is the world capitalist economy that has the center, periphery and semi-periphery.

The grouping is not geographical, but takes into account the nature of relations. For example, within the center of the capitalist world-economy there are stablished relations of cooperation and competition, and between the center and the periphery - exploitation and dependence. Mixed relations are typical to semi-periphery.

The theory of I. Wallerstein was developed by L. Sclair, who replaced the concept of world-system with global system, and the term "internationalization" - with globalization. In his works, L. Sclair structured the modern global system, highlighting three levels: economic, political, and ideological-cultural. Each had its key institutions such as transnational corporations at the economic level, transnational classes of capitalists at the political level, and consumerism at the level of ideology and culture.

However, this viewpoint is not justified even at the level of description: the key institutions of transnational corporations at the economic level and the transnational class of capitalists at the political level are often the same institution, and ideology has penetrated the economic and political levels long ago.

S. Huntington in his work "Clash of civilizations" assumed that the modern world is divided into distinct civilizational blocks, cultural and ethnic enclaves, where any integration is minimized, nationalism and fundamentalism at the cultural and ideological levels are strengthened [4].

According to researchers such as P. Hirst, G. Thompson, L. Weiss, et al., it can be said that global government and a global economy are delusional and imposed by the USA, while the consumerism in the modern world stimulates the development of fundamentalism and nationalism as defensive responses. In the analysis of globalization, it is skeptics that tend to equate globalization with modernization. Globalization is seen as the spread of Western institutions of modernization, which are based on capitalism and democracy. Summarizing the opinions of skeptics, it can be noted that they deny the existence of globalization and consider inter-state relations through the prism of national and international division instead of local and global one. Sceptics emphasize the importance of the national borders of Ssates, where the trends of nationalism and regionalism are increasing.

The third position is represented by the so-called transformists. They focus on some significant trends in globalization, which they recognize as a phenomena of the modern world. The position of the transformers is specific because they put culture in the basis of their concept. It is especially manifested in the works of M. Waters, P. Berger, R. Robertson, D. Tomlinson, etc. The transformists typical of the following features: there is no single logic of development, as globalization is a contradictory process; globalization is a long-term process; the historical aspect is the key one in the development of globalization, since it is the history of culture that prevents the general globalization. Another specific feature is the statement of the growing role of the nation state.

Despite the complex nature of the current globalization processes, transformists note that these processes cover the entire world. However, there is a rigid division within the global system, where the traditional division into the center and the periphery is irrelevant. The proponents of this theory note the changes in traditions that occur under the influence of globalization, the formation of a new hierarchy unrelated to geographical boundaries. The position of hyperglobalists is based on two fundamental theories – the deterritorization and glocalization.

While describing these conceptual theoretical models, it should be noted that the concept of deterritorization is expressed in the idea of fundamental transformation of relations between the place of residence, cultural and social practices, experience, and identity. Deterritorization is a key aspect of transformation of culture, state and all aspects of the local in the setting of globalization. It is especially clearly traced in the works of McLuhan, E. Giddens, D. Harvey, and their followers.

The term "glocalization" appeared in marketing and meant the adaptation of a global product to any local market. In social sciences, this concept has become widespread thanks to the researcher R. Robertson and other theorists of globalization like H. Knodker, D. Tomlinson, A. Appadurai, W. Hannerz, and others. The concept of "glocalization" demonstrates the two sides, the synthesis of globalization and localization. It is based on the theory of hybridization, which describes the features of the phenomenon of the merging cultures of the colonial and post-colonial worlds.

Unlike the hyperglobalists, transformists recognize the growing role of the state as a protective mechanism aimed at preserving its own sovereignty, as a response to global challenges. This trend can be traced in the studies of P. Berger, U. Shwerkens, K. Mitchell, where the state's response is to change the nature of the relationship between state power, territorial integrity and sovereignty. All this fully corresponds to the meaning of the theories of glocalization and deterritorization. Summarizing the position of the transformists, the authors emphasize that globalization still remains a key phenomenon that combines the trends of globalization and localization, although it is a controversial and ambiguous process that causes transformation of all spheres of society.

For almost three decades, the concept of "globalization" has been used by scientists to refer to the growing economic, socio-cultural and political interdependence of the world [5]. Apart from this, the process of localization in the scientific literature has no generally accepted definition, as well as the proper attention of researchers. For example, M. Maters believes that localization is the consolidation of ethnic and civilizational entities pursuing a policy of "cultural isolation", the desire for self-preservation of various cultural areas with their particular value systems [6]. L. Serdyukova believes it is the process of using the economic potential of a geographically defined region (within a country) or even a large city in order to successfully implement innovations and compete together through interconnected networks and alliances [7]. The American economist P. Rutland defines the localization as the process of adapting new technologies and ideas to local conditions [8]. According to Giddens, these are restrictions on the time interval, as well as physical and symbolic boundaries [9].

The economic component of localization is related to the processes of economic space formation. The concept of economic space originates from the theories of production placement, where they are considered as a "spatial" economic category. The works of I. H. von Thünen, A. Weber, V. Christaller, A. Lesh traces the dependence of the localization of economic activity from the minimization of transport costs.

The problems of localization of enterprises in different territories are studied in the work of E. Hoover, W. Izard, S. Tzamansky, reflecting the specific properties and changes localized around the major financial centers of the economic space. Localization of the economic space around large centers ("growth poles"), according to the concept F. Perru, is a result of the accumulation of innovations around the dominant industry [10].

Discussion: The authors believes that the concept of transformists is the most promising, as the global financial crisis has clearly demonstrated the interdependence of the global economies: according to the IMF, world GDP showed a negative trend for the first time since the World War II. On the other hand, the isolationism trends in the policies of the states aimed at protecting their own interests points at existing barriers and the indisputable role of public regulation. A striking example is the decision of the UK to withdraw from the EU, or the so-called Brexit, the US withdrawal from the TPP, attempts of economic isolation of Russia by the "overseas partners", or the last referendum for withdrawal from their countries in Catalonia and Iraqi Kurdistan.

The analysis of the scientific literature allowed formulating some approaches to understanding the essence of economic space localization, formed in economic science, with the continuing lack of attention of localization researchers (Table 2).

Table 2. Theoretical approaches to studying the economic space localization

Approach	**Brief characteristic**	**Factors of localization**
Marketing V. V. Tomilov, L. N. Semerkova	The individual segments of the market represent the localized economic space.	industry market segmentation

Factor A. Weber, V. Cristaller; V. Launhardt; A. Lesh; I. G. von Thunen; N. L. Vargin; L. I. Nivorozhkina N. A. Feoktistova	Determined due to geographical or economic zoning.	Economic and geographical factors: - geographical location; - economic specialization; - traditions of production and consumption; - interregional relations; - degree of economic diversification; - degree of development of agglomeration, etc.
Territorial E. Hoover, W. Izard; E. G. Animitsa; V. S. Bochko, N. Yu. Vlasov; A. S. Ginsburga, O. A. Kozlova; A. I. Kuz'min, A. G. Orudzhiev; N. M. Ratner, A. I. Tatarkin	The boundaries are allocated regarding the territorial division.	Level: - mega level (interstate enterprises) - macro level (national); - meso level (regional); - micro level (municipal).
Interdisciplinary F. Peru; J. Budivil'; M. Porter; P. A. Minakir, A. N. Dem'yanenko , N. M.Surnina.	Comprehensive assessment of the impact of factors on the formation and development of a localized economic space.	Analysis parameters: - economic structure; - technological system development; - social structure; - development of information system; - regulatory institutions.

The factor approach shows the reasons of formation and directions of further development of localized space, where locality is recognized as local reproduction.

Within the framework of the territorial approach, localization is understood as the limitation of an object in space, or territory within administrative boundaries. Such object is viewed as a system capable of self-organization and self-management**.**

The interdisciplinary approach covers not only geographical but also economic factors of localization: the localized economic space is considered as a special reproducing system in a limited territory. This system acts as a network of interdependent and complementary productive units that perform the division of labor.

Localized economic space has the following properties: it has its own, defined boundaries and functioning features, manifested in the organized development logic and in the ability to change the nature of relations in case of the transformation of the external environment.

It should be noted that most scientists are interested in one factor of the economic space localization at one of the levels. In authors opinion, localization is a complex and ambiguous phenomenon, which is manifested as an impact of a vast number of factors. Therefore, the interdisciplinary approach seems to be the most comprehensive compared with others.

The interdisciplinary approach formulated the features of the state as a localized economic space (at the macro level). They are the presence of formal (territorial) borders, non-formal borders (zones of attraction, influence), and the integration of various socio-economic relations. As a result of generalization, the authors propose the following classification of criteria and factors of economic localization of the state (Table 3).

Table 3. Criteria and factors of economic localization of the state [11].

Type of localization	Factors of localization	Localization criterion
Historical and cultural	Traditions and customs, mentality, historical community	Late or slow transition to a market economy: - list of the least developed countries according to the UN (51 States)
Geographical	Geographical position of the state	An "island effect" is created that does not allow to benefit from interacting with suppliers and markets of neighboring countries: - land-locked territories (44 states); - sea-locked territories (35 states).
Political	All sorts of pressure from the international community to force the state to change its political course	Sanctions of major international associations or organizations: - UN security Council sanctions list (13 States); - others (Russia, Syria, Israel, etc.).
Socio-economic	Openness of the economy	Level of participation in global economic processes: - high level (e.g. Ireland); - middle level (e.g. China); - low level (e.g. DPRK)

The authors believe that economic localization of the state can be defined as a special state of the economy with a purposeful focus on the development of its internal potential, with elements of limiting external economic relations emerging from the influence of internal and/or external factors. The nature, as well as the degree of influence of these factors on the country's economy, is very diverse, as they have different origin: historical and cultural, geographical, political, and socio-economic.

The local economy has the following features:

- autonomy, viewed as an internal potential for sustainable functioning of a subject of economy being limited by general or certain type of economic relations;
- adaptability, defined as the ability of the economy to adapt to changing operating conditions, taking into account past experience and new realities;
- self-organization, expressed in the ability to concentrate and efficiently use the resources to ensure not only survival, but also development;
- innovation, which is expressed in the adoption of non-conventional mechanisms aimed at efficient economic development according to the scientific and technological progress.

The primary role in the functioning of the localized economy is played by the existing norms in the public sphere, the development of the system of socio-economic reproduction and economy, the degree of resource availability, and the level of integration of external relations. Development at the macro level is fundamentally impossible without taking these factors into account.

Today, globalization is accompanied by a similar, but somewhat contradictory process - economic localization. This process involves countries or groups of countries with the same stages of economic development. They, creating alliances or associations (macro - and mega-levels) on mutually beneficial terms through the liberalization of trade, movement of capital and people according to the interests of their economic security policies.

It occurs in the background of the ongoing intensifying integration processes, when most of the world trade turnover accounts for the share of existing integration associations. They include the EU-28%, NAFTA, ASEAN, MERCUSOR - 54% of world commercial exports and 57% of commercial imports' there is a redistribution of positions between them too. R. I. Khasbulatov noted that since the end of the last century there had been a slight decrease in the share of the largest players of the EU and NAFTA, and a slight increase in ASEAN, MERCOSUR in world exports [12].

It seems obvious that the contradictory development of the modern economy is manifested, on the one hand, by the involvement of globalization, and on the other, by the desire to preserve national identification in the form of economic localization. This statement is justified by three stable trends in the world economic situation, which have been particularly evident since 2000 [13].

The first one is the desire of countries to diversify import flows so as to prevent the prevalence of products manufactured by one country. Analyzing the import flows of countries, it can be noted that in the import of Brazil from 2000 to 2016 has reduced the share of the USA from 23% to 17%; in Saudi Arabia, the share of the USA reduced from 18% to 12%; in Japan, it reduced from 9.5% to 4.6%; in structure of goods imported to China, the share of Japan fell sharply from 17% to 10%. As a result, the volume of flows of any state did not exceed 10% of the China imports. This trend is typical for the economies of large countries such as Turkey (13% of all imports), Israel (13% of all imports), Greece (11% of all imports), and Libya (12% of all imports). Independent foreign economic policy has a positive impact on the economic security of the country considering the availability of alternatives with possible external threats.

The second trend is reduced impact of developed countries on individual regions, in case when their impact on the economic life of the territory is no longer decisive. Free space is developed by the most significant partners. For example, from 2000 to 2016 in Western Europe, the share of U.S. imports in the UK decreased from 13% to 7.5%, in Germany - from 8.4% to 6.2%, in France - from 8.45% to 6.9%, in Italy - from 5.3% to 3.8%, etc. The UK imports share in Norway also decreased from 8.3% to 5.7%, in Finland - from 6.5% to 3%, in Denmark - from 9% to 4.1%, etc. At the same time, the influence of China and to a lesser extent Germany is growing.

In South America, the economic influence of the United States has also reduced: in Argentina it decreased from 19% to 13%, in Brazil - from 23% to 17%, in Peru - from 23% to 19%, and in Colombia - from 33% to 27%, etc. During this period, Brazil would strengthen its position as a regional leader. On the territory of Western Asia, in the UAE, Oman, Saudi Arabia, Qatar, Kuwait, etc., there is a strong decline in the influence of Japan. In various African countries (South Africa, Chad, Sudan, Libya, Congo, Egypt, Algeria, Angola, etc.) the presence of France, Germany, Great Britain, Italy, and the United States has reduced. Even in North America, the share of US imports in Canada and Mexico fell from 68% and 74% to 53% and 49% respectively.

The increasing multipolarity of the world, manifested in the reduction of the zones of influence of world leaders on the economies of different countries, can justify the strengthening of the confrontation between these leaders and developing countries looking for new markets, such as the States of the Asia-Pacific region and some other countries.

The third trend is increasing the role of the regional leader influencing the economic situation in the region. In South America, the share of imports of countries (Argentina, Chile, Peru, Colombia, Venezuela, etc.) has strengthened the position of Brazil (it is from 5% to 24% on the African continent) and increases claims to regional leadership in South Africa. In the setting of the increased competition in world markets and the significant strengthening of China's position, when assessing the prospects of changing the positions of the leading economic powers, one should take into account that despite the decline in the US share in world commercial exports, the US scientific, technological and economic potential allows holding the hold key positions in the most advanced sectors. The basis for foreign economic expansion now is a set of high-tech industries (commercial high-tech services, public high-tech services, high-tech production). Their share in the US economy (about 40% of GDP) is significantly higher than the average for the EU countries and Japan (32% and 30%, respectively). In China, despite significant growth, this figure is twice less than that of the US, especially in services. The same is for India, Brazil and Russia.

Conclusion: Within the framework of integration associations, Russia seeks new formats of trade and economic cooperation. The foreign economic policy of the "Western partners" indirectly stimulates cooperation with countries that face a new choice. The intensification of cooperation between Russia and other member States within the EAEU, SCO, BRICS, and the project OBOR is accompanied by further expansion of trade and economic relations between Russia, ASEAN and other associations, as well as bilateral relations, including China.

The US abandonment of the TPP and the transition to a different format of relations in the region, of course, gives new advantages to integration projects with the leading role of China. To some extent, it contributes to deeper cooperation between Russia and China, and stronger coordination of their actions in order to promote global stability. However, the reduction of trade barriers and other agreements within new trade and economic agreements can significantly complicate the access of goods and services from third countries, including Russia, and contribute to their displacement from the markets of new associations.

In this regard, the task of coordinating the policy of economic security and the development of trade and economic cooperation with other countries on a bilateral and multilateral basis is becoming increasingly relevant in Russia. This task is complicated by the fact that Russia has been integrated into the world economy mainly due to the export of raw materials, and the financial stability of the Russian economy is largely influenced by volatility due to fluctuations in prices and demand for natural resources. Thus, reducing dependence on external risks requires more efficient use of other components of the economic potential of the country.

Long - term strengthening of positions in the world markets requires increasing national competitiveness on the basis of innovation and implementation of a set of measures of scientific, technical, industrial, trade policy in their relationship, creating conditions for commercialization of research and development. It goes beyond high technologies, it is about innovations in low-tech industries and services that make up a large part of Russian economy. Elimination of a significant gap between the existing developments and the degree of their use - patenting, production development, export of high-tech products and technologies.

The current stage of globalization is typical of increased international competition, global instability resulting from a number of factors of economic, financial, social, information, cultural, and religious origin, and increasing contradictions, as well as the asymmetry of global economic development. The authors agree with S. A. Shanin that the situation in the modern world economy is quite complex due to the fact that the world economy is far from global: the developing countries form a closed economy, and international economic exchange is not peculiar to them. Globalization has covered only developed countries, but among them there are problems of its processes that are related to the division of labor and production [14-18]. The ongoing transformations at the national, regional and global levels and the strengthening of the political factor in trade and economic relations are changing the perception of power centers, guidelines for the development of interaction and, along with the associated risks, open up new opportunities for adjusting the conditions and coordinating the positions of countries and their associations.

Abstract

The research is acute because Russian physical culture and sports program "Ready to labor and defense" (GTO) is required by time and many social factors. National health has been formed by systematic and regular significant state projects and events. Revival of the modern GTO program in educational institutions may become important for forming of physical activity and healthy lifestyle of students. The purpose of the research is to point out the problems of the modern GTO program implementation into educational institutions. The main method of investigation is monitoring of the GTO system in Nizhny Novgorod region in cooperation with testing centers. The problems of the modern GTO program realization in educational institutions of Nizhny Novgorod region are stated in the paper. They will help to find ways of involving students in systematic physical training and coping with GTO standards. This information may be used as recommendations for heads and responsible for sport and extracurricular work in professional educational institutions of different levels.

Keywords: Russian program, physical culture and sports, ready to labor and defense (GTO), problems of students, examinations and tests.

Introduction

The topicality of this research is determined by the fact that nowadays there are a lot of problems in physical culture and sport in Russia which are connected with low activity of students in systematic physical training. The main problem of students` physical culture is that they do not have a systematic approach to physical trainings, despite having obligatory PT lessons at all the levels of education (Ateş, 2018). Health promotion, balanced and versatile personal development of students is expected as a result of appropriate modern GTO program implementing in high school. This way renovation of physical culture and popular sports system of children, school-children and students in educational institutions is needed.

Considering the problem of GTO program revival it is necessary to mention that it was originated in Russia in the XX century. The reason for its creating was need of the society in a healthy generation ready for labor and defense. Today physical culture and sport still plays an important role in socializing and upbringing of a citizen. GTO program, which was renewed in 2014, was the basis of the physical education system in Soviet time, which was being tested during many years (Kozlova et al., 2016).

Many researchers wrote about the topicality of the modern GTO program implementation into the system of higher education in Russia (Strelchenko et al., 2015; Filimonova, Stolov & Filimonova, 2015a; Blokhin & Petrov, 2015; Gridnev & Shpagin, 2015; Smirnov, 2016; Zhoraeva & Korolev, 2016; Semenova & Batalova, 2017; Chobanu, 2017). They emphasize the necessity of the students` physical culture system renovation which must aim at passing the modern GTO examination, and the importance of students` motivation to systematic physical trainings. The authors also point out that PT lessons should prepare and direct students to passing the modern GTO examination.

In various scientific works the problems and issues on the problem of students' physical culture formation are discussed (Anfilatova & Solgalov, 2015; Filimonova, Stolov & Filimonova, 2015b; Starkova, 2016; Ustinov, 2017; Shunyaev, Kambaratov & Shunyaeva, 2017; Voronkov et al., 2017; Bobkov & Kuzmin, 2017; Semenova & Batalova, 2017; Abayomi, Oyeniyi & Aina, 2017; Glazistov, 2017; Kostenok, Moseeva. & Konyakhina, 2018; Lima, Mendes & Paiva, 2018; Andrianova & Veselkin, 2018, Çimen Polat, 2018; Kostenok, Moseeva & Konyakhina, 2018; Huang & Reynoso, 2018; Ma, 2019; Yan, 2019). It is said that the implemented system encounters significant difficulties connected with its realization at universities. This may become a reason of ineffective students involving in GTO system.

The purpose of this paper is to point out problems of Russian physical culture and sports program "Ready to labor and defense" (GTO) in Nizhny Novgorod region.

Methodological Framework

Prerequisites for conducting an analysis of the implementation of the GTO system in higher education institutions of the Nizhny Novgorod region was the circumstance when the faculty of physical culture and sports of the Federal State Budgetary Educational Institution of Higher Education "Nizhny Novgorod State Pedagogical University named after KozmaMinin" in the fall of 2016 managed to win the right to implement an additional professional program «Training of sports judges of the main judiciary board and judicial brigades of physical and sporting events of the All-Russian sports complex "Ready for Labor and Defense"» (GTO) (Zhemchug, Voronin & Ivanova, 2017). Exactly the same refresher courses were implemented this year, where more than 250 judges, administrators and administrators of the TRP centers in the Nizhny Novgorod region received training.

During the training of judicial brigades, within the framework of the round table, the main problems of the participation of students in the delivery of VFSK GTO standards were identified. The project managers in the Nizhny Novgorod region note the significant interest in the participation of schoolchildren, and the lack of students' interest. Physical fitness tests were held on all age levels of general education schools during 1996-1997. These indicators are available for viewing on the official website. At the same time, there is much less interest from students in launching a project on testing students at secondary and higher educational institutions everywhere in 2018, as it was supposed. Studies show that the GTO project is interesting for students who are systematically engaged in physical culture and sports, and even so, it is difficult for them to carry out a complex on marks of distinction (Pavlyuchenko, 2015; Ajallooeian et al, 2015). Moreover, the return to the practice of physical training of students of the complex of the standards of the GTO in the new format, besides the task of organizing a full sports students' movement with the maximum number of participants at the new qualitative level, includes the formation and promotion of a healthy lifestyle with social and professional adaptation of young people (Kutepov, 2015). The questions of the formation a healthy lifestyle through the inclusion sports activities in preparing students are open not only in our country, but also in a number of other countries (Bystritskaya et al., 2018; R & M, 2017).

Monitoring of the higher education system allows us to include various forms of inclusive education that can motivate students to various activities, including sports (Kudryavtsev & Kashtanova, 2016).

The loss of interest of students to fulfill the standards of the next level is still connected with the fact that some undergraduate students already have a sign of distinction, which they performed before entering a higher educational institution, are not interested in the implementation of standards during their studying. They are not stimulated for performance, and sports students that have a mark of distinction do not see prospects for obtaining an other mark. One form of stimulating students to perform the standards of the GTO is the compilation of a rating or portfolio for them. This can be done through the student rating system.

Such learning technologies with the inclusion of the active students' position in the system have already been successfully applied in practice. These technologies are used in completely different multi-ethnic structures of modern higher education (Ivanova, Bystritskaya & Burkhanova, 2017).

In one of the latest studies it is noted that in order for students to perceive the system of the GTO complex not as regular tasks, under which they will receive credit, we need to show them that this system will allow them to reach a new level of work on themselves and recovery. Thus, one of the tasks of introducing the GTO complex among students is the formation of students' interest in the complex as a whole, and not in the implementation of standards separately (Tuyurov & Blokhin, 2016; Korolev & Salmova, 2017; Medvedev, 2017; Podolyaka & Podolyaka, 2018; Abayeva, 2018; Chahine, 2018).

A notional and significant factor for students in organizing physical education classes during studying which are aimed at realization the standards of the GTO complex is the development of programs, an increase in sports infrastructure and a variety of equipment that allows not only to comply with the standards, but also to produce full training for them (Andrianova & Veselkin, 2018).

An important role in the organization of introducing VFSK GTO in universities is played by the activity of teachers of physical education, university management and the RSSS, which is aimed at competently organizing the studying and training processes in compliance with the leading pedagogical principles, physiological and medical fundamentals, which is the main condition for effective physical improvement of students and progressive development mass (including students) sports in Russia (Shvetsov, 2015).

One of the important components for the effective preparation of students for passing the standards of the GTO complex and maintaining a healthy lifestyle is the need of properly build exercises during the training sessions, pick up a training load, and also organize additional sections on sports, outdoor games and competitions for students to participate in sports life, create open and accessible sports fields, swimming pools and gyms (Chuvilin & Gushina, 2018).

Formation of the competence personality of a student through a healthy lifestyle and joining sports work is one of the important tasks of the modern society of higher educational institutions (Kamerilova et al., 2018).

In addition, the readiness of students of higher educational institutions to implement tests of the GTO should also be considered. Among students boys have poorly developed aerobic endurance at the same time girls have poor high-speed motor qualities and strength endurance. This fact indicates that students pay little attention to independent exercises, and even less engaged in running training. At the same time, it is known that the minimum amount of motor activity of students is up to 8-10 hours per week (Blinkov, 2017).

A separate problem is the preparation for specialized standards, such as tourist activities, despite the fact that students are really interested in such types (Peshkov, Salakhov & Pasishnikov, 2017).

In addition to the adaptive capabilities of the modern complex to systematic physical culture and sports, students of higher educational institutions do not have sufficient physical fitness to implement the standards. According to the results of admission tests in 2017 in Nizhny Novgorod State Pedagogical University named after Kozma Minin, only nine students and two teachers passed the tests for the gold insignia.

The main problems of involving students of higher educational institutions in the modern system of the GTO is that only students who have been involved in any kind of sports agree to take tests for insignia. Students who are engaged in physical culture in the school program do not want to take part in the tests for several reasons. One of these reasons is the low physical fitness of students. The second reason for the refusal to pass the standards of the modern complex, which students face is the receipt of medical admission to the tests. Doctors-therapists have little knowledge of the forms of certificate which is required for admission to the GTO regulations. The lack of a clear agreement between the Ministry of Sports and the Ministry of Health of the Nizhny Novgorod region affects the possibility of obtaining a medical opinion on the admission of the standards of the complex. A pediatrician for children, or a general practitioner for an adult population, in addition to defining a medical group, must conduct functional tests to discharge a certificate to a person who voluntarily wants to implement the standards of the complex. The form on which it is necessary to indicate that a person may be allowed to perform the testing of the complex of the certificate for children and adults remains unclear. This problem may be solved by contacting private and paid clinics where a pediatrician or therapist performs the functional studies which are necessary to enable a person to meet the standards of the All-Russian GTO Sports Complex.

Today, the social project of the Association of Student Sports Clubs in cooperation with the Directorate of Sports and Social Projects (Federal Operator of the GTO Complex), which implemented the

All-Russian Youth Sports Project “From the STO to the distinction mark of the TRP” in 2018, is a great help for engaging students of the Nizhny Novgorod region. This project is supported by the Ministry of Education and Science of the Russian Federation and the Ministry of Sports of the Russian Federation.

This project implements the standards of the complex, which entered into force on January 1, 2018, enshrined in the relevant order of the Ministry of Sports of the Russian Federation dated 06.19.2017.

The purpose of this project is the promotion and involvement of students in the preparation and implementation of test standards of GTO program. This confirms that that the level of student participation in the implementation of GTO program standards throughout the country is low. The development and implementation of this project to attract students to the implementation of standards may be another impetus to motivate students to the modern GTO examination.

The implementation of this project will make it possible to identify not only the state of affairs in involving students in the All-Russian system of the GTO program, but also to check the level of preparation for the GTO program. Each student within the walls of his or her home institution of higher education may evaluate its strengths by fulfilling the standards of the GTO, while being guided by the sports infrastructure of the university.

Results and Discussions

During the theoretical review and identification of a number of practical problems on the implementation of the All-Russian physical training and sports program "Ready for Labor and Defense" in higher education institutions of the Nizhny Novgorod region.

Considering the rating of the All-Russian sports program for the third quarter of 2018, the Nizhny Novgorod region ranks 68th among eighty-five regions of the Russian Federation. With a population of more than three million, the total number of people registered in the GTO system is no more than one hundred twenty thousand, which is only four percent of the total population. At the same time, the share of the population who fulfilled the standards for marks of distinction is about 0.6 percent. At the same time, a large number of published materials on the introduction of the modern GTO program in regional mass media was noted in the Nizhny Novgorod region.

This state of affairs indicates significant difficulties in the implementation of the GTO system, not only among students, but also in the region as a whole. This indicates the relevance of finding new ways to inform, clarify and motivate students to the modern GTO program. The development and introduction of the standards of the GTO program into the system of physical education of students in the youth will make it possible to conduct informational promotion and orientation of students to the system of training and performing tests.

The system of physical education of students in higher education institutions, together with social projects, sports clubs, the Ministry of Education and the Ministry of Sports will create an optimal environment for involving students in mass sports, systematic classes and focus on the GTO distinction.

The system of stimulating student youth by the leadership of higher educational institutions, drawing up a rating and portfolio of a student, taking into account the fulfillment of the distinction by a student, will significantly increase the interest of students in the preparation and implementation of standards of the modern complex.

One of the important components of the voluntary system of preparing students for the testing of the GTO program is the question of independent study. The priority in this direction should be sectional classes in educational institutions, physical culture classes and elective courses in physical culture, which may include elements of teaching a system of self-preparation for the age level of relevant young people.

The conducted study of the problem of introducing the modern GTO program in higher education institutions of Nizhny Novgorod region is consistent with the scientific results of other authors who addressed the problems of introducing the modern GTO program among students. Analysis and synthesis of the problems presented by authors from other regions of Russia made it possible to single out the most current problems among the common: 1) Low motivation and lack of incentives to comply with the standards of GTO program at the student's age; 2) Poor agitation of students to the purposeful involvement in systematic classes for the implementation of GTO program for merit badge; 3) Partial inclusion of GTO program in the curriculum in physical education during classes with students; 4) Lack of material and technical base for full preparation for the implementation of the modern GTO program.Particular problems of Nizhny Novgorod region, which can be separately identified, taking into account the general problems that are mentioned above: 1) Difficulties in obtaining medical admission for the implementation of the modern GTO program; 2) Insufficient number of projects and sports events for students of higher educational institutions focused on attracting students for the implementation of the modern GTO program; 3) Lack of coherence with student sports clubs and institutions of higher education for the implementation of GTO events; 4) Insufficient campaign work with students to attract them to systematic classes aimed at further implementation of standards of the modern GTO program.

Conclusion

The authors identified the main problems of the implementation of All-Russian physical training and sports GTO program among students of higher educational institutions of Nizhny Novgorod region. These problems largely intersect with problems in other Regions of the Russian Federation. However, there are particular problems peculiar to Nizhny Novgorod region. The reviewed sources of scientific literature on the problem of introducing the modern GTO program among university students do not point to the difficulty of obtaining a medical certificate for the implementation of the modern GTO program. During studying in 2016 and 2018, more than 500 judges, administrators and heads of testing centers in Nizhny Novgorod region, in the panel discussion, this was one of the main problems that could not be resolved. The perspective of solving the problem of coordinating medical admission is possible with the agreement of the Ministry of Sports and the Ministry of Health of Nizhny Novgorod Region. Thus, to improve the implementation of the modern GTO program among students of higher educational institutions of Nizhny Novgorod region, it is necessary to solve the most important problems of medical admission, increasing sports competitions aimed at familiarizing with GTO program and coordinating sports structural organizations on agitation and introducing the modern complex among students.

Recommendations

The identification of common and particular problems of the implementation of All-Russian GTO sports program among students of higher educational institutions of Nizhny Novgorod region reflects the urgency of improving the ways of introducing the system of mass sports and physical education among students. The inclusion of modern program elements in the content of courses on physical education, the modification of program material with the inclusion of the modern GTO program in the standards of the academic discipline will allow students of higher educational institutions not only to familiarize themselves with the GTO program, but also to test their ability to fulfill the standards for the mark of distinction. Comparison of students' own standards of higher educational institutions and stimulation by the teacher to systematic classes in order to improve physical fitness will help motivate young people to get acquainted with the modern system and perform tests. The results of the research conducted by the authors can be useful for teachers of the discipline of physical education, elective courses and modules on physical education of higher educational institutions. The use of the data of the reviewed article allows for a wider indication of the problems of introducing a modern GTO program among students, and allows teachers and organization leaders to develop and apply a set of measures to stimulate students to systematically engage in physical culture and the implementation of standards for the modern GTO program on insignia.

Abstract

The importance of the topic to be investigated is due to the fact that a brand new approach to the academic achievement evaluation is one of the key elements in the modernization of pedagogical education. Since the assessment reveals both the academic content of education and its organization, new approaches to the creation of evaluation instruments shall be developed to evaluate both assimilated knowledge and practical skills. The purpose of the study consists in developing new approaches to the creation of assessment instruments to evaluate university students' academic achievements based on the systemic and activity-based approaches. The leading method of research used is analyzing the instruments of academic achievements evaluation that already exist and developing new approaches to the creation of evaluation instruments in the form of flow charts. The article provides some examples of new evaluation instruments being designed as well as methodological guidelines that include forms of presenting results, objectives being diagnosed, evaluation criteria, and goals realization indicators. The article defines the structure of the methodological part of a student's paper and the conditions and requirements that allow for it to become an instrument of the academic achievement evaluation. The findings can be applied in the organization of trainee teachers' evaluation aimed at obtaining an objective evaluation of the academic results achieved as well as evaluating the competence of the teaching staff that work in the vocational training and additional education institutions.

Keywords: teacher, competence, academic achievements, indicators, objectives being diagnosed, evaluation instruments.

Introduction

The importance of the topic to be investigated is due to the fact that a brand new approach to the evaluation of academic achievements is one of the key elements in the modernization of pedagogical education. The assessment reveals both the academic content of education and the organization of student's preparation (Kasprzhak & Kalashnikov, 2014; Shekhonin, Tarlykov & Kleshcheva, 2014; Sangalova, 2014; Bahremand, 2015; Mukwambo, 2016; Ismail et al, 2017; Marques et al, 2018; Kariuki & Mbugua, 2018; Tastan & Davoudi, 2018; Kodekova et al, 2018; Bentley & Bossé, 2018) that together form an integral unity; as a trainee teacher shall not only assimilate some knowledge but also be able to apply it in the ever-changing educational environment and respond promptly to the new challenges. That is why learning to create new evaluation instruments is important. The evaluation instruments should be designed in such a way that allows a student completing a task to demonstrate both their knowledge and practical skills (Rebrin, 2014; Abramov, Artemyeva & Makhutov, 2013; Kashtanova & Kudryavtsev, 2015; Kagoiya & Kagema, 2018). That is to say, when developing new evaluation instruments, one should take into account the relationship between the key concepts of the modern professional pedagogical education: competences, academic achievements, work actions (Ismagilov, 2013; Ivanova et al., 2017; Koldina, 2015; Pishiy & Makashova, 2015; Santana et al., 2017).

The competences listed in the professional standard for teachers, in accordance with the learning standard Federal State Educational Standard of the Higher Education "Pedagogical education" of 2013, shall be considered norms describing a graduate's preparedness for various types of professional activities. The Federal State Educational Standard sees a competence as an ability to apply knowledge, skills and experience in professional occupation. Competences are determined by the type of professional occupation as well as by the fields of their practical application and are related to the professional objectives that a higher education institution graduate shall be ready for. In other words, the measurement and evaluation of competences formed can only be possible when a student is involved in some real professional activity or some organized academic activities which require the application of assimilated competences that, in their turn, will help to master real work actions that are going to define the level of a teacher's professional preparation (Egorov & Vasilyeva, 2015; Gustyakhina, 2009; Uvarovskaya, 2014).

Methodological Framework

The methodological framework for the elaboration of new approaches to the evaluation of a student's academic achievements − being considered both knowledge and practical skills − is based on an epistemological theory that the process of learning consists of various stages and requires both the acquisition of new information and its comprehension e.g. when applying it in practice (Gustyakhina, 2009). The activity-oriented approach that the Federal State Educational Standard is based on, implies students' inclusion into various activities and allows to describe the results of students' academic activities through their academic achievements (AA) (Perevoshchikova et al., 2016; Bystritskaya et al., 2018; Perevoshchikova & Lekomtseva, 2016).

Following the activity-based approach, the structure of the planned academic achievements shall consist of the knowledge required to perform certain work actions; work actions; skills that demonstrate one's individual level of mastering actions (Karpushkina & Kudryavtsev, 2015). This approach allows to find the relation between competences and work activities and understand what are the academic achievements that shall be measured and evaluated (Perevoshchikova & Lekomtseva, 2016).

The study suggests a number of indicators and control tasks as evaluation instruments for each type of activity mastered in the education process. All the evaluation instruments designed have to do with various types of academic activities i.e. with a product that a student creates, elaborates and submits to the teacher or their fellow-students in the dates and form that were specified beforehand. That is why the methodological framework contains the description of forms in which the results and their specific characteristics shall be presented (Perevoshchikova, 2016).

Results

In accordance with the professional standard and following the logic of the activity-based approach, the structure of the academic achievements shall consist of the knowledge required to perform certain work actions; work actions; skills that demonstrate one's individual level of mastering work actions. So that, to evaluate to what extent a student has assimilated competences in the chosen speciality, decomposition of competences included in the curriculum shall be performed conforming to the Professional Standard where each competence shall imply certain academic achievements.

By academic achievements we mean the results of students' academic activity presented in the form of the description of the actions performed. As O.I. Rebrin (2014) rightly states, the results shall reflect "what a student shall know, understand or be able to demonstrate after completing a course or its part" (Rebrin, 2014; Prokhorova & Semchenko, 2018; Chelnokova, Agaev & Tyumaseva, 2018). Such a procedure allows to select academic subjects, determine their academic content and single out the objects of evaluation in the form of a set of academic achievements. Let's take professional competence number 2 (PK-2), "the ability to use modern methods and technologies of teaching and diagnostics" from the pedagogy education standard

44.03.05 Pedagogical education (professional standard for teachers, 2013). This competence includes two interrelated aspects of the future profession. The first has to do with methods and technologies of learning in various fields of study. That is why subjects dealing with different methods and technologies of learning, including practices adopted in other countries, shall be added to the curriculum. The second aspect implies a student's preparation for the design of testing and assessment materials which requires studying the subjects that shall help to develop students' skills in designing and using testing and assessment material technologies; the effectiveness of the said preparation can nowadays be evaluated by means of academic monitoring (Makhotin, 2014; Perevoshchikova, 2014).

Let us consider the part of the procedure of the PK-2 competence decomposition (the ability to use modern methods and technologies of teaching and diagnostics) that has to do with diagnostic methods and technologies (table 1).

Table 1. Relationship between work activities, competences and academic achievements in "Physical culture teaching methodology".

Academic achievements			Indicators	Evaluation instruments
Knowledge (shall know)	Work actions	Skills (Shall be able)		
basic concepts of the physical culture theory and methodology; physical education instruments and methods applied at physical culture lessons; subject matter and structure of diagnostic activity, types and functions of diagnostics; different methods of diagnostics and evaluation criteria of the education quality in education institutions	control and evaluation of academic achievements, current and final results of a course being completed	demonstrates skills in design and usage of modern teaching methods and technologies, controls and evaluates students' academic achievements	designs a system of monitoring for students' academic achievements; knows methods of curriculum comprehension diagnostics	Case-type task: "Methods of development and diagnostics of students' physical qualities in the process of physical culture education in an education institution" Test on terminology

The PK-2 competence academic achievements are shown in the table as knowledge, work actions as per the teachers' professional standard, and skills in the usage of modern methods and technologies aimed at the development and diagnostics of students' physical qualities in the process of physical culture education in an education institution. The 'indicators' column that will help in the evaluation of academic achievements, is of crucial importance. The last column of table 1 contains the evaluation instruments applied to the academic achievements given in the first three columns.

Considering the abovementioned, evaluation instruments for current, interim and final assessment shall assume such a form that will allow to measure academic achievements. In other words, the instruments that are supposed to be elaborated shall be used in the evaluation of students' profession-oriented knowledge and skills, on the one hand, and the evaluation of competences that have been formed, on the other hand. (Prokhorova & Semchenko, 2018)

We are going to list and explain the major stages of the AA evaluation instruments design based on the technologies of developing AA evaluation instruments suggested by E.N. Perevoshchikova (2014) and E.A. Chelnokova, N.F. Agaev and Z.I. Tyumaseva (2018).

1. Write out all the Federal State Educational Standard competences that shall be subject to control.

2. Should only a part of a competence be subject to check, the parts that require assessment shall be singled out.

3. Write out the work actions stipulated in the professional standard that correspond to the competences or their parts singled out.

4. Formulate academic achievements (objects of evaluation).

Academic achievements shall be formulated in the way that clearly reflects a student's activities (action indicators) that will constitute the basis for further evaluation.

5. Single out structural components of a control assignment.

6. Formulate an assignment. It shall be noted that an evaluation instrument is supposed to be created and formulated in the context of a professionally relevant situation as in this case some real work actions that a student chooses in order to resolve the task, can be observed. Depending on the academic achievements that are subject to evaluation, a list of requirements (questions) shall be formulated to indicate how a student is expected to act in such a situation. The other two components (the basis and the solution) usually are not included into the control assignments. However, the basis of a control assignment being fulfilled shall be specified in order to differentiate between the already assimilated material and the new one. Moreover, the basis is important for a teacher as it allows to determine what activities are going to be checked by means of this or that assignment. An evaluation form being designed shall contain a benchmark solution. But since a solution is a complex process, instead of a benchmark, a series of indicators is used to assess the completeness and correctness of the actions that a student opted for.

7. Formulate evaluation criteria, single out indicators and create an evaluation scale as in (table 2):

Table 2. Academic achievement evaluation criteria

Evaluation criteria	Indicators	Evaluation mark
1. If the solution is complete	The designed scheme meets all the requirements of the task in question	3
	The designed scheme meets the requirements only partially but it can be used for the systematization of knowledge	2
	The designed scheme meets some of the requirements and shall be improved	1
	The scheme is not designed or does not meet the requirements	0
If it is well-explained (argumentation of the solution)	The specific design of the scheme is explained (all the key aspects of the solution are explained)	2
	Only some of the aspects of the task solution are explained	1
	The explanation to the scheme contains inaccuracies, omissions and does not conform to the universal educational actions (The explanation contains inaccuracies and omissions)	0

That is to say, maximum mark for assignment 1 is five points.

8. Determine levels of academic achievements (table 3).

Table 3. Determining levels of academic achievement.

Levels	Evaluation mark in points	Share of the assignments fulfilled
Optimal	5, 4	No less than 85%
Acceptable	3	No less than 70%
Critical	2	No less than 50%
Unacceptable	Less than 2	Less than 50%

9. Formulate a conclusion from the assignment being resolved.

The structure of the evaluation instrument can include three interconnected elements: organizational and methodical; academic content-based; and criterial-evaluational. (Perevoshchikova, 2016; Shabalina & Dovydova, 2015; Kuznetsov et al., 2016) The first stage of the evaluation method design requires finding a solution to a series of organizational and methodological issues, in particular, the object of evaluation shall be found and a professionally relevant situation shall be formulated to allow a student to show their knowledge and skills. That is why the first stage is called organizational and methodical.

This part of a form shall include the section of an academic subject and particular competences and work activities that are formed in the process of learning. According to the competences and activities singled out, academic achievements that are subject to context-based evaluation, shall be formulated.

After that, the organizational-methodological part of the evaluation form presupposes that a specific situation shall be selected or created, requirements (subtasks) to its solution shall be formulated (analysis, reflection, search of actions to be undertaken), the basis of the task shall be indicated (theoretical facts, laws, logic, principles that provide some basis for the task solution). The first part of the evaluation form shall also contain a solution that will serve as the benchmark for evaluation or a range of indicators shall be developed to assess qualitative characteristics of a solution (if it is complete, correct, well-grounded, logical, etc.). To make explicit the practical significance of a situation, additional information can be provided to a student to give them a better understanding of the real situation and shed light on possible solutions.

The second and the third parts of the AA evaluation method that includes the content of the assignment and the evaluation procedure, are intended for students.

The second, content-based, part of an evaluation instrument includes an assignment or a task which also describes assignments and requirements.

In the third AA evaluation part dealing with criteria and evaluation, criteria and indicators, levels and scale of evaluation are shown.

Conclusion

Developing the design technologies for academic achievement evaluation instruments is based on the following principles that reflect the innovative character of evaluation methods design.

1) decomposition of competences considering work actions listed in the teachers' professional standard;

2) usage of innovational methods and technologies of teaching that help to form competences and develop AA evaluation instruments on their basis;

3) determining the structure of evaluation instruments according to the measurement and assessment principles: validity, objectiveness, accessibility of evaluation procedures;

4) determination of evaluation criteria and indicators in conformity with the indicators of students' actions specified in the definition of academic achievement.

In our opinion, designing a brand new system of evaluation instruments will ensure that a teacher-to-be should realize that the relationship between the existing teachers' standard and teachers' professional activity also consists in understanding the levels of a teacher's professional development specified:

The first level is the level of a beginning teacher. They can work as teachers after successfully passing a qualification exam; have assimilated competences at a basic level and can undertake work functions that are presupposed by their professional qualification.

The second level includes advanced-level teachers that have assimilated a variety of competences e.g. those that imply working with specific groups of children, such as children with deviant behaviour, special needs, children with no or little knowledge of the language, gifted children.

The third level is of a specialist in teaching methods that has mastered teaching methods and technologies at such a high level that they have the right to teach other teachers.

The forth level has to do with a teacher-researcher that summarizes professional experience to develop new educational technologies and that can approve of and implement innovational technologies in education.

We believe that it can encourage teachers-to-be to see their personal ecosystem as an environment where they will exist and develop and make them understand the regulations and mechanisms of interaction in the educational environment, so that a teacher of the future will be born, the one that can combine the roles of a corrector, a moderator, and a tutor.

Recommendations

To design a modern system of academic achievements evaluation, objects of control shall be determined i.e. academic achievements obtained in the course of learning, and then the ones that are subject to evaluation shall be singled out as well as the instruments for their adequate evaluation shall be designed. The decomposition of competences implies the description of academic achievements based on the indicators reflecting activity-oriented characteristics of the competences. The indicators of planned goal achievement shall be described through a student's actions that were singled out and can be measured. The hierarchy of indicators shall specify the levels of goal achievement (bottom to top), e.g. Bloom's taxonomy, allow its adequate evaluation at each stage of education process in order to build a variable and interactive learning environment for teachers' preparation.

Abstract

The relevance of the study of the organization of postgraduate education is determined by the need to ensure the high professionalism of young professionals, including teachers. In this regard, this article is aimed at substantiating the scientific and theoretical foundations of the organization of training and development of specialists of educational organizations, the development of practical recommendations on the formation and implementation of a model for the creation of Mentoring Centers for postgraduate education. The methodological basis of this study was the results of advanced fundamental and applied domestic and foreign studies on the problems of postgraduate education, as well as general scientific methods of cognition, including theoretical studies (analysis, synthesis, aggregation), survey methods, survey, expert assessments. The article presents the results of the activity of the successfully implemented model of creating the professional development environment of the municipal education system - the "Center for Mentoring and Working with Young Specialists" Balashikha of the Moscow Region, created with the aim of networking teachers for their professional development. Considered promising technologies, organizational schemes that provide professional and personal growth of novice teachers. The results of the research work carried out by the authors of the article over a number of years in the field of building the practice of postgraduate education are presented. Successful solutions to the current problems of methodological support of young specialists in this Center are described. The system of mentoring activities presented in the article has great potential and can be used in other regions and for young professionals from other spheres of professional activity.

Keywords: continuing education, professional development, mentoring model, young professionals.

Introduction

The need to address this problem is primarily due to the fact that the most important factor in the success of transformations in the education system throughout the world is the high professionalism of teachers and the quality of professional training of teachers (Bauer, Kopka & Brindt, 2006; Dorozhkin & Shcherbina, 2014; Bakhshandeh et al, 2015; Mukwambo, 2016; Peres, Moreira & Mesquita, 2018; Kariuki & Mbugua, 2018; Tastan & Davoudi, 2018; Etcuban & Pantinople, 2018).

In the Russian Federation, much attention is paid to the issues of improving the vocational education system, the purpose of which is to train a qualified, competitive, competent, responsible worker, fluent in his profession, oriented in related fields of activity, capable of effectively working in the world-class specialty, ready for permanent professional growth, social and professional mobility (Lazarev, 2017). But besides vocational education in colleges and universities, it is important to create postgraduate education centers where young specialists can get answers to questions arising at the first workplace, acquire the knowledge and skills necessary to work in a particular position and taking into account the specific features of a particular organization. Payment for training young specialists in such centers can be made either on the basis of subsidies from regional and municipal budgets, or at the expense of the organizations — the places of work of young specialists, and the own means of the young specialists.

If we consider the option of payment for receiving graduate education of young specialists by Russian companies, then based on the results of the research conducted by PricewaterhouseCoopers (PWC), it can be concluded that the cost per employee in our country is $ 112 thousand per year, and in Western Europe they the figure reaches $ 203 thousand. In general., according to PWC calculations, the return on investments in human capital in Russia is much higher. For every dollar invested in an employee in our country, Russian companies receive $ 2.3, while European - only $ 1.16. According to the personnel holding ANCOR, only in 2–3% of Russian and foreign companies operating in our country this item takes 5-10% of the budget. Most Russian (53%) and foreign (46%) companies spend only 2% of their budget on staff training (Larionova et al., 2017).

Specialists in the field of personnel training and development identify four main elements of a set of personnel development measures: staff training, delegation of authority, work with the personnel reserve, planning and career development. Thus, training is only one form of staff development, including young professionals.

Considering educational organizations as the subject area of this study, it should be noted that when starting a professional activity in an educational institution, beginning teachers inevitably face difficulties as they pass the period of adaptation as young specialists. At the same time, young professionals are responsible for learning outcomes on a par with experienced staff. Even with a sufficiently high level of readiness for pedagogical activity, personal and professional adaptation of a novice school teacher or university teacher can be difficult and can take a long period of time.

As the results of various studies show (Novikova, 2018; Prahalad & Hamel, 2009), for the adaptation period to be successful, young teachers need not only help, but help purposefully, systematically, targeted, and personified. It is necessary to build an integrated system of support for young specialists, characterized by the unity of fundamental and applied aspects of pedagogical research, based on the creation and implementation of a model of postgraduate education, including in the municipal education system, which, according to the authors of the article, can be implemented in Mentoring Centers (Pivovarov & Skurikhina, 2017; Močinić & Feresin, 2017).

Methodological Framework

The methodological basis of this study was the results of advanced fundamental and applied domestic and foreign studies on the problems of postgraduate education, the use of various types of mentorship, as a form of training and development of young professionals.

Conducting a study of the theory of the use of mentoring to provide postgraduate education was carried out using general scientific methods of cognition, including theoretical studies (analysis, synthesis, aggregation). Evaluation of the effectiveness of the creation of Mentoring Centers for postgraduate education was carried out using comparative analysis and expert assessments. The center of mentoring and work with young specialists and the virtual platform EMERCOM Laboratory were selected as the object of research.

In the course of the study, a complex of questionnaires and surveys was developed for young specialists, beginners and experienced teachers, tutors. With the help of the developed toolkit and monitoring, it was possible to identify professional deficiencies and personal difficulties. A model of professional development of a young specialist in the system of continuous postgraduate education based on the resources of the municipal education system has been created. On the basis of requests, programs of advanced training and psychological training have been created. Developed comprehensive activities that combine the basic principles of the Center. Methodological manuals for constructing individual trajectories of the professional development of young specialists have been published.

Literature Review

Such authors as D. Mettyuz, D. Megginson & M. Stuart (2006) identify the following main areas of staff development:

– individual development;

– development to meet the needs of the current job or situation;
– development in relation to new working conditions;
– development aimed at improving and filling the meaning of the activities of individuals, companies or the wider community.

Since personnel development is a process of discrete, complex transformational improvement of workers in their professional activities for self-realization and the timely formation of personnel competencies required by an enterprise, this process can be managed at several levels - the employee himself, the management of the organization in which he works, the state authorities responsible for the sector of the economy to which the particular enterprise belongs.

Personnel training is an important area of personnel development, as in the modern world there is an acute problem of consolidating and updating acquired knowledge and skills. Often, the improvement of professional training becomes a decisive factor in the development of an enterprise. Let us further consider the main scientific approaches to the definition of the essence of the concept "personnel training" (Table 1).

Table 1. The main scientific and theoretical approaches to the definition of the essence of the concept "personnel training"

№	Concept definition	Authors, source
1	Personnel training is an important feature of improving professionalism, since training is based on the development of professional knowledge and skills of employees, taking into account the goals of the relevant departments, which are determined by the organization's strategy.	T.A. Afanasyeva & S.A. Yarusheva (2016)
2	Personnel training is a purposefully organized, systematically and systematically carried out process of mastering knowledge, skills and ways of communication under the guidance of experienced teachers, mentors, specialists, managers.	A.Ya. Kibanov (2010)
3	Personnel training is a deliberately conducted activity aimed at improving the abilities of the staff required to perform the work at present and to develop the potential of employees. Training is focused on the present and is designed to solve the immediate problems of the business, and its goal is to instill in the employee specific skills that are needed today and now.	V.M. Maslova (2015)
4	Personnel training is a systemic training of employees for changes occurring both in the external environment of the enterprise (state economic policy, legislation and taxation system, the emergence of new technical standards and quality systems), and in the internal (enterprise restructuring, change in the social and age structure of personnel, the emergence of new jobs)	B. Gütl, F.M. Orthey and S. Laske (2006)

Conditions for the effectiveness of training are: first, the awareness of the learner of the need for learning, the perception of the purpose of learning as his own; secondly, the focus of the educational process on the achievement of predetermined specific labor results by all participants in the training; thirdly, the focus is not so much on the possibilities and accumulated experience in organizing the process of personnel training, but on the existing need of employees for updating their knowledge, that is, prioritizing (primary) plans for staff training and the secondary plans for training centers in meeting these needs (Emerson & Stewart, 2011; Zaitseva et al., 2017; Feizuldayeva et al, 2018).

A.Ya. Kibanov (2010) identifies two forms of personnel training: on-the-job training (carried out with a specific task setting at the workplace) and out-of-work training (necessary for obtaining theoretical knowledge and acquiring the ability to behave in accordance with the requirements of the production environment).

Education outside the workplace is carried out using methods such as: lecturing; programmed training courses; conferences, seminars; a method of leadership training, based on the independent solution of specific problems from industrial practice; business games; methods of solving production and economic problems using models; working group ("quality circle" and "instead of studying"). A.L. Slobodskoy (2013), as well as M.I Magura and M.B Kurbatova. (2003) propose the following classification of personnel training methods: traditional methods, active teaching methods, on-the-job training methods.

Results and Discussion

The main problems identified by the results of the first years of the functioning of the Young Specialist School, as a Mentoring Center, their causes and ways of elimination.

In 2012, as part of the pedagogical campaign "The experience of the winners of PNPE to young specialists" (PNPE - priority national project "Education"), a round table of the participants of the conference "The thorny path of my profession" was held by the teachers of the winning PNPE, methodologists and young specialists. Certain shortcomings and problems were identified in the activities of the existing Young Specialist School, which did not allow achieving the stated goal. In particular, it was noted that "classes at the School of Young Specialists will allow the recent university graduate to quickly adapt to work at school, avoid moments of self-doubt, establish successful communication with all participants of the pedagogical process, form the motivation for further self-education on the subject and methods of teaching , "To feel the taste" of professional achievements, to reveal their individuality and, finally, to start forming their own professional trajectory "(Borodin & Borodina, 2012).

The present project of creating a mentorship model at the municipal level assumed a study of the issues of organizing a postgraduate educational space, ensuring the readiness of a young specialist to successful and professional creative activity, to productive interaction with all participants of the educational process in modern society (Sarafanova et al., 2018).

This research project was a logical continuation of the project "Young Specialist School", previously developed (from 2010 to 2013), in Zeleznodorozhniy of Moscow region. When the authors of the article summed up the experimental work, a problem analysis of the pilot project was made and the unresolved contradictions were revealed:

– between the requirements for the professional competencies of the modern teacher and the discrepancy between the university education and the realities of the school;
– between the needs of the subjects of the educational process and ways to meet them.

In the process of the study, the main problems identified by the results of the first years of the young specialist's school were identified (Table 2)

Table 2. The main problems identified by the results of the first years of the young specialist's School, their causes and ways to eliminate

Problem	Causes of the problem	Possible solutions to the problems
Low attendanc e.	1. The topics of classes that were incorrectly planned are not sufficiently relevant for young specialists, even before the start of classes and acquaintance with the target audience. 2. Ineffective forms of work with young professionals. Selected lecture informative classes did not meet the modern requirements of adult education. 3. Great workload of young specialists, which makes it impossible to attend full-time classes monthly.	1. It is necessary to develop a work plan for the Center, based on the requests of young teachers, their professional deficiencies, topical issues of modern education, and to do targeted classes for a specific target audience, even if they do not cover the entire community of young professionals. 2. Lectures and conversations, as a form of work, are not suitable for training and inclusion of young professionals in the process of professional growth, therefore, the main forms of work should be organizational-activity, interactive, which will enable all young professionals to be involved in solving the problem of classes at different levels. 3. It is recommended to conduct face-to-face classes for everyone once a quarter on general topics, and the other face-to-face meetings - by targeted request of a certain category of young professionals or through

		individual consultations with mentors. At the same time, part of the work should be transferred to a specially created virtual platform in the social network, as well as created internship and methodological platforms on a specific topic.
Low activity of young teachers.	1. The low level of awareness of young teachers about events taking place in the educational space of the municipality, ignorance of the rules and criteria for participation in events. 2. The uncertainty of the trainees in their own abilities, the fear of not meeting a certain professional level, as a consequence of low self-esteem of young professionals. Also, there are cases of inadequate, high self-esteem. 3. Many young specialists in parallel with work receive an education of bachelors, are trained in a magistracy, are busy during sessions that occur simultaneously with events in which they could take part.	1. The need to increase the number of channels informing students about the events held in the Center. In addition, all information should be available in a specially formulated group on social networks, where plans for upcoming events are published. 2. To increase self-confidence, it is necessary to conduct "trial" events, open lessons and discuss them together, as well as develop programs for psychological and pedagogical trainings. 3. For a greater inclusion of young teachers, the learning process should be "individualized", suggesting that young professionals, on the basis of their own deficiencies, develop an individual trajectory of professional growth and personal development, create a set of methodological recommendations and manuals for drawing up individual plans for young professionals.

Development of a model for the creation of Mentoring Centers for postgraduate education

The model for creating mentoring centers for postgraduate education is based on ideas for building relationships based on cooperation, dialogue, partnership, taking into account the need to maximize the individuality of the teacher, while maintaining collective interaction and co-creation. The principles of the human-like approach are used (Khutorskoy, 2018); provisions of the theory and practice of personality-oriented, humanistic education (Borodin & Borodina, 2018; Donskoy, Oboskalov & Utkina, 2018).

When developing a model for the creation of Mentoring Centers for the provision of postgraduate education, a list of indicators and the effectiveness of the functioning of this center were determined:

1. Quality indicators:

– the need for young professionals and other actors in the products of the Center, the demand for postgraduate education programs, and ongoing activities;

– the nature of the initiatives taken by young professionals in the educational organization, the educational space of the city;

– ways to implement initiatives and new projects;

– the productivity of cooperation, its resultant component both within educational organizations where young professionals work, and beyond;

– the role of the mentoring center in the life of the municipal education system and requests for the dissemination of experience;

– prestige and public recognition of the Center among the professional community of the city, region, country;

2. Quantitative indicators:

– the number and significance of activities initiated by the Center;

– quantitative growth of participants of the Center and its structural divisions;

– the number of external organizations, creative and professional personnel, researchers involved in the activities of the Center;

– the quantity and quality of the produced methodic products, etc.

Results of the implementation of the model for the creation of Mentoring Centers for the provision of postgraduate education.

According to the results of the Mentoring Center for young professional teachers in 2012–2018, measures were implemented in the following areas of activity:

– identification and analysis of "problem areas" of young specialists, drawing up a list of situations of difficulties in professional activities;

– recruitment and training of curators from among experienced and efficient specialist teachers; creating a map of the resources of the municipal education system;

– provision of scientific, methodological and practical assistance to young specialists of educational institutions;

– providing practical methodological and psychological support (supervision, mentoring, tutoring) with the aim of the fastest professional adaptation in the workplace;

– assistance in advanced training in various specializations of young specialists together with subject CMAs (city methodical associations);

– formation of a methodical package of tools for a young specialist - teacher;

– creation of "individual plans for professional and personal growth" and assistance in promoting young teachers along individual trajectories.

The structural elements of the Center created with the participation of the authors of the article are: "Mentoring Center", "MCHS Laboratory", "School of Tutors", "School of Leaders", "Association of the Best Teachers Balashikha city"(table 3) have different goals, tasks and activities, but together they create optimal conditions for continuous professional development of young professionals, finding opportunities to improve their performance and self-development.

Table 3. Structural elements of the model of the Center for Mentoring and Working with Young Professionals

Elements of the model	Mentoring Center (including the "Association of the best teachers")	Laboratory of Young Specialist	School tutors (including "School of the asset")
Who carries out the activity?	Members of the Association of the best teachers, mentors, supervisors, working as consultants. An open base of mentors, special events in the format of "quick dates" when new temporary tandems can be defined: mentor - young specialist (instructed)	Young professionals (length of service 0-3 years) as part of the creative team on problematic issues, identified as difficulties in their activities.	Young teachers with experience of more than 3 years, "grown up" in the Center and trained in the "School of tutors" and received the status of a tutor.
Problem to solve	What forms of support and training of young teachers to choose and develop new relevant methods of support.	How to create individual trajectories for each young teacher, the plan of his individual personal development and professional growth.	How to use network interaction through coordinators - tutors and to ensure the interrelation of traditions and innovations, the system of norms, value systems,

			allowing to build a development strategy for the Center.
Resources	Lectures on NMR, creative groups of teachers - winners of PNPE, resource centers for teachers, internship platforms for educational institutions, third-party organizations.	Network professional community, VC "MCHS Laboratory" group, tutors from young professionals, experienced mentors.	Young teachers with work experience of more than 3 years.
Possible risks	The workload of experienced teachers who spread the experience, the unwillingness of the teachers themselves to be mentors, the "proprietary" positions of administrations, the unwillingness to "let go" or load valuable personnel.	Innovative work in this mode, a large proportion of independence and unwillingness of young professionals themselves, the lack of an experienced mentor or tutor.	Non-traditional and new for secondary schools the role of a tutor, the vagueness of its functional responsibilities, high dependence on personal desire and motivation to be a tutor (in fact, a volunteer).
Expected results	Various methods of transferring the experience and training of young specialists have been compiled, the most effective forms of mentors work have been selected, including internship sites for teachers and educational institutions, a Map of resources of the municipal educational environment has been created, regulations have been developed, public events and teaching materials have been published.	Each young teacher identified his own difficulties, made a plan to overcome them at the beginning of the next school year, developed an individual trajectory of professional development and personal growth, an individual strategy for effective activity, and a stable motivation for self-development, design and construction of effective means of teaching and communication.	A community of tutors who are ready to continue cooperation with the Center on a voluntary basis has been created. Each educational institution has its own tutors - coordinators who send young specialists to the Center and accompany them as a curator.

Analysis of the effectiveness of the created environment allows us to state the real development of the subjective position of young teachers to their own professional self-education and self-development. 87 young specialists successfully passed the certification with assignment of qualification categories to them.

Conclusion

In the process of research and practical implementation of the results of this study, the authors of the article developed a set of conditions and mechanisms for the professional development of a teacher, which ensure the development effect. In addition, extensive practical material was obtained: the creation of author projects and scientific and methodological developments; the creation of design teams of schools and individual creative groups of teachers - internship and municipal methodological sites; preparation of competitive works of various levels; participation in the work of scientific conferences, in national projects in the field of education, governor prizes. The accumulated material indicates the effectiveness of the study and the practical implementation of the mentoring model from the standpoint of personal growth and the development of professional competence of young professionals as a key indicator of professionalism.

Effective activity of the analyzed Center for mentoring and working with young specialists (the number of working young specialists in general education organizations, the number of young professionals participating and winning in professional competitions, events, passing advanced training programs, the number certified for the category, the qualitative growth of professionalism, answers to questioning, and etc.) allows considering it as an effective system for improving the professional competence of young specialists. The presence of performance criteria, as well as quantitative and qualitative results suggest that the presented mentoring system has great potential and can be used in other regions for young professionals from other fields of professional activity.

Abstract

The relevance of the study is due to the need to improve the competitiveness and productivity of domestic producers, which is currently considered as one of the key areas of sustainable socio-economic development of the country. The purpose of the article is to develop methodical aspects of assessing the development of potential of the socio-economic system's productivity and the formation of the main elements of the monitoring system's productivity. The leading approach to the study of this problem is the resource approach, which allows at the stages of justification and implementation of targeted productivity enhancement programs to form rationally a set of projects and activities, taking into account resource constraints and program-target planning. The main results of the study consist in the development of a categorical apparatus for the development of productivity potential, the formation of a system of economic efficiency indicators of productivity potential development, the characteristics and structuring of the main elements of the system of monitoring the socio-economic system's productivity. The significance of the results is that the developed methodical framework for assessing the economic efficiency of productivity potential's development can determine the degree of productivity impact on the competitiveness of the socio-economic system, quantify the current productivity potential, and develop a scheme for monitoring productivity. The practical significance of the study involves the development of methodical toolkit for assessing the productivity of the socio-economic system at different levels of management. The results of the study are intended for their use in the formation of methodical and regulatory framework to improve the efficiency of socio-economic systems, preparation of organizational and economic mechanisms for the implementation of projects and measures to improve productivity.

Keywords: resource approach, program and target planning,productivity potential of socio-economic system, productivity intensification, productivity monitoring, national economic effect.

Introduction

1.1. The Study Relevance

The overall situation of the Russian economy today is characterized by financial and economic instability, a marked reduction in research on the priority areas of innovative development, including in the field of science, techniques and technology and, as a consequence, a decrease in the competitiveness of domestic enterprises. At the same time, the majority of Russian enterprises in terms of competitiveness is significantly inferior to foreign companies and organizations. With significant potential for all types of economic resources, the Russian economy occupies a modest place in the global division of labor.

Assessing the efficiency of domestic production systems, it is necessary to take into account the high resource capacity of most types of products associated, including a high level of production and non-production losses, which increases production costs and worsens the competitive position of Russian enterprises (Mingaleev, 2006; Fartash et al., 2018).

In this regard, the market of goods and services is becoming increasingly important due to productivity growth as a whole as a condition of reducing production costs, improving the quality of products and enterprise's obtaining of a set of competitive advantages (Davoudi et al., 2018).

In the assessments of the country's leadership, low productivity of enterprises, including labor productivity, is one of the main problems of the domestic economy that requires urgent solutions. As one of the main, the President of the Russian Federation set the task of four-fold increase in labor productivity by 2020 (Order of the Government of the Russian Federation 2227-R, 2011). This problem is particularly relevant in the context of the transition of the country's economy to import substitution in key areas of science, techniques and technology. This is primarily due to the increasing role of labor productivity in achieving competitive advantages of domestic industrial enterprises (Pavlov, 2007). The current situation in the Russian economy requires a serious rethinking of productivity problem and a fundamental change of attitude to it at all levels of management.

Serious domestic research on the problems of productivity growth of the socio-economic system, its relationship with modern toolkit for the organization of production based on integrated accounting of all types of resources is quite small. Scientific concepts devoted to the study of these important problems are considered as if in parallel, without taking into account their mutual influence and mutual conditionality.

In this regard, of particular importance for improving the efficiency of industrial enterprises is the research aimed at developing scientific and methodological approaches to assessing the economic efficiency of the development of productivity potential to determine the degree of impact of productivity on the competitiveness of the socio-economic system, quantify the current potential of productivity and develop a conceptual framework for monitoring productivity (Mingaleev, 1999).

2. Methodological Framework

2.1. The Study Methodological Apparatus

The methodological basis of the study was the program-target approach (Koshkin & Mingaleev, 2003) to the planning of increasing the productivity of the socio-economic system and a systematic approach to the effective implementation of programs in this area. In the course of the research the following research methods were used: analysis of legislative and regulatory acts, critical analysis of methods, productivity improvement programs, statistical analysis, multivariate analysis of methods for assessing the potential of productivity, methods of forming a set of measures to improve productivity, integration of economic efficiency indicators, systematization and generalization of facts and concepts, modeling, design, analysis, study and generalization of the experience of production systems' results, multiplicative methods.

2.2. Object of Research

As the object of research were enterprises: KAZ named after S. P. Gorbunov - a branch of PJSC "Tupolev", JSC "Elecon Plant", JSC "POZIS", JSC "Kazan motor-building production Association".

2.3. The Study Stages

The study was conducted in three stages:

– at the first stage-the preparatory stage- the current state of the problem in economic theory and practice, the variety of scientific approaches to the definition of the economic category *productivity* were analyzed; a classification of objects, socio-economic results of increasing the productivity of the socio-economic system and means to achieve them were developed;

– at the second stage-the main stage-the system of indicators of national economic efficiency's increase of social and economic system's productivity was developed; the concept of an assessment and monitoring of increase of social and economic system's productivity was formed; experimental work on check of efficiency of this concept was carried out;

– At the third stage – the final stage-the systematization and generalization of the study results were carried out; the theoretical conclusions were clarified; the processing and registration of the study results were carried out.

Results

3.1. Current State of the Problem under Study

The productivity of the socio-economic system is becoming an important condition for economic development, as the growth of the output of traditional and innovative products and services, the improvement of existing and the development of new technologies provide a significant share of gross domestic product's growth in the leading countries of the world. The increase in productivity largely determines the level of national economic development, as it affects the competitiveness of both business and the economy as a whole.

Before we talk about the assessment of productivity potential, directions and methods of its development, the search for reserves to improve productivity and programming of a set of measures, it is necessary to define the concept of *productivity*.

Analysis of scientific approaches and modern information resources to the definition of the economic category *productivity* allows us to establish that the interpretation of this concept's content throughout the history of economic science was very diverse and depended on the initial positions of economic theory, the peculiarities of economic schools' methodology or the goals and objectives of specific economic research.

All the variety of the considered theories of productivity can be divided into two main groups: the theory of productivity study and the theory of the study of all types of resources' productivity, including natural, industrial and socio-cultural.

Having considered the existing definitions, the authors propose the following definition of productivity-an aggregate indicator of the socio-economic system's efficiency, characterizing the ratio of the total volume of sales (services) for a certain period of time to the total cost of all types of resources produced over the same period of time in all areas of the system (production, non-production and IT-sphere).

However, morphological analysis of the *potential* definitions shows that not all contain reserves (a set of resources) that can be developed with a certain degree of efficiency over a period. In addition, the existing interpretations of the *potential* do not provide a comparative description of the socio-economic system's *potential*.

In this regard, the following definition of the productivity potential is proposed-it is the result of comparing the productivity of the socio-economic system with an exemplary level (indicator).

The development of productivity potential is characterized by the intensification of productivity. Under this term, the author understands the speed of mastering of the socio-economic system's potential productivity at different levels of management (micro, mesa, and macro).

To make informed management decisions in the field of productivity improvement, it is necessary to classify the objects, socio-economic results of the socio-economic system's productivity increasing and the means to achieve them. This classification includes several objects: industry, agriculture, construction, education, housing and communal services, etc. The classification of the object *national economy as a whole* is presented in table 1.

Table 1. Object - national economy as a whole

Means of achievement	Socio-economic results
Development and implementation of a long-term strategy to increase the productivity of the socio-economic system. Development and implementation of the national program of labor productivity enhancement and GDP growth. Development and implementation of regional productivity enhancement programs. Creation of the expert Council of the national program of labor productivity enhancement and GDP growth; State support for projects with a multiplier effect,	Structural restructuring of the country's economy by increasing the productivity of all types of resources including labor ones (increase in value added for each employee). The increase in production and services, the creation of new high-tech jobs that provide a high level of productivity and product quality. Changing the structure of GRP in the direction of increasing the production and sale of competitive science-intensive products with a high share of intellectual component in the value added; the growth of the share of science-intensive products in

including in related industries. Improvement of regulatory and methodical support to increase productivity. Active transfer of technologies in universities and institutes, the introduction of new high-performance technologies in enterprises, the creation of technology parks and engineering centers of various types of property, territories of advanced development (Salimov & Mingaleev, 2012). Development of the system of venture funds, direct investment in productivity enhancement programs at all levels. Efficient use of supercomputers for large-scale socio-economic calculations and forecasts of national and world economy development; multi-purpose use of space satellites.	the volume of GRP. Ensuring sustainable balanced economic development and improving the quality of life of the population by creating conditions for the growth of competitiveness of production, import substitution in the domestic market Increasing the productivity of labor and the socio-economic system as a whole is a key (most important strategic) task, since it is the growth of the economy, the growth of citizens' incomes to the level of developed countries, the increase in taxes, the growth of pensions and wages of citizens.

The classification developed by the authors, shows that the increase in the productivity of the socio-economic system is a factor of economic growth of national welfare.

Based on the above-mentioned socio-economic results, the authors proposed a system of economic efficiency's indicators of the socio-economic system's productivity increasing.

3.2. The System of Indicators

Evaluation and consideration of the productivity potential in the region are the most important components of the process of improving the efficiency of the development of innovative potential. The validity of management decisions depends on the reliability of the economic assessment of innovation potential.

Efficiency is the effectiveness of economic activity, which is the ratio of the effect (result) to the costs that led to the achievement of this effect. An effect is a result of economic activity, which is the difference between the resulting income and costs. Economic efficiency is a relative indicator, and the economic effect is absolute.

The development of productivity potential is associated with the implementation of a set of projects to improve productivity and as a result, the effectiveness of the management of these projects depends on the development of productivity potential in General.

Justification of measures to assess the effectiveness of productivity potential's mastering requires a comparison of results and costs, by determining the need for resources, which in turn implies, in the author's opinion, the use of indicators of economic efficiency of productivity potential's mastering, which are presented in table 2.

Table 2. The system of national economic efficiency indicators of mastering the productivity potential

№. p / n	Indicator's name	unit of measurement	The symbol and formula for determining
1	Potential of the region productivity	RUB	$PP_r = \sum_{i=1}^{n} (P_{w_i} - P_{r_i}),$ (1) Where: PP_r – Potential of the region productivity; P_{w_i} - Productivity of i –th of type of industrialized country's resource, taken as a model, RUB.;

			Pr_i - Productivity of i –th type of region's resource (entity of the Russian Federation), RUB.
2	Intensification of productivity	RUB / year	$I_{PP}=\frac{\Delta PP}{\Delta T}=\frac{PP_{i+1}-PP_i}{t_{i+1}-t_i}$, (2) Where: ΔPP - the development of productivity potential, the RUB; ΔT –the period of mastering the productivity potential, the year; PP_i, PP_{i+1} – the value of the productivity potential before and after mastering, RUB.; t_i, t_{i+1} – the time series chosen for the calculations, the year.
3	Investing in productivity enhancing	RUB	$I_P=\sum_{i=1}^{n}\frac{I_i}{(1+r)^i}$, (3) Where: I_i - investments in activities in order to enhance productivity for the periods $i=1\ldots n$, RUB; r - discount rate (rate).
4	Net profit of enterprises (commercial effect)	RUB	$PV_P=\sum_{i=1}^{n}\frac{PV_{Pi}}{(1+r)^i}$, (4) Where: PV_{Pi} – component of the economic effect which is caused by the net revenues from the exploitation of the potential performance for the periods $i=1\ldots n$, RUB; r - discount rate (rate).
5	The economic effect due to reducing fees for environmental management (ecological and economic effect)	RUB	$PN_P=\sum_{i=1}^{n}\frac{PN_{Pi}}{(1+r)^i}$, (5) Where: PN_{Pi} – ecological and economic component of the national economic effect for the periods $i=1\ldots n$, RUB; r - discount rate (rate).
6	Economic effect due to tax revenues (fiscal effect)	RUB	$PB_P=\sum_{i=1}^{n}\frac{PB_{P_i}}{(1+r)^i}$, (6) Where: PB_{P_i} – budget revenues for the implementation of projects to improve productivity for the periods $i=1\ldots n$, RUB; r –discount rate (rate).
7	National economic effect	RUB	$PP_P=PV_P+PN_P+PB_P+PP_S-I_P$, (7) Where: PP_S –socio-economic component due to the improvement of living conditions and habitat, RUB;
8	Integral indicator of national economic efficiency	-	$\overline{PS}_P=(PV_P+PN_P+PB_P+PP_P-I_P)/I_P$, (8)

At the stage of formation of the system of national economic efficiency's indicators of mastering the potential's productivity, there are some difficulties (Babushkin, 2012). They are caused by the lack or incompleteness of the list of possible long-term projects (activities) to improve productivity, and for projects in the near future with an assessment of the integral indicator of economic efficiency from their implementation.

Thus, the evaluation of the comparative efficiency of the productivity potential's development is reduced to the comparison of the resources' productivity of the industrialized country, taken as a model and the productivity of the resources of a particular region under consideration.

3.3. Productivity Enhancement Evaluation and Monitoring Concept

A system-based approach to the effective implementation of productivity programs involves the justification of the concept of evaluation and implementation (development) of productivity potential (Mistakhov, Mingaleev & Silenov, 2015). The structure of the concept elements may vary. However, the peculiarity of its formation involves the development of an integrated system of decisions at possible hierarchical levels of management of the national economy in time under financial, time and other constraints (figure 1). Therefore, a system-based approach (Trutnev, 2011), characterized by a multilevel hierarchical system with the formalization of the main stages according to the cyclic principle, should be chosen for the formation of the concept.

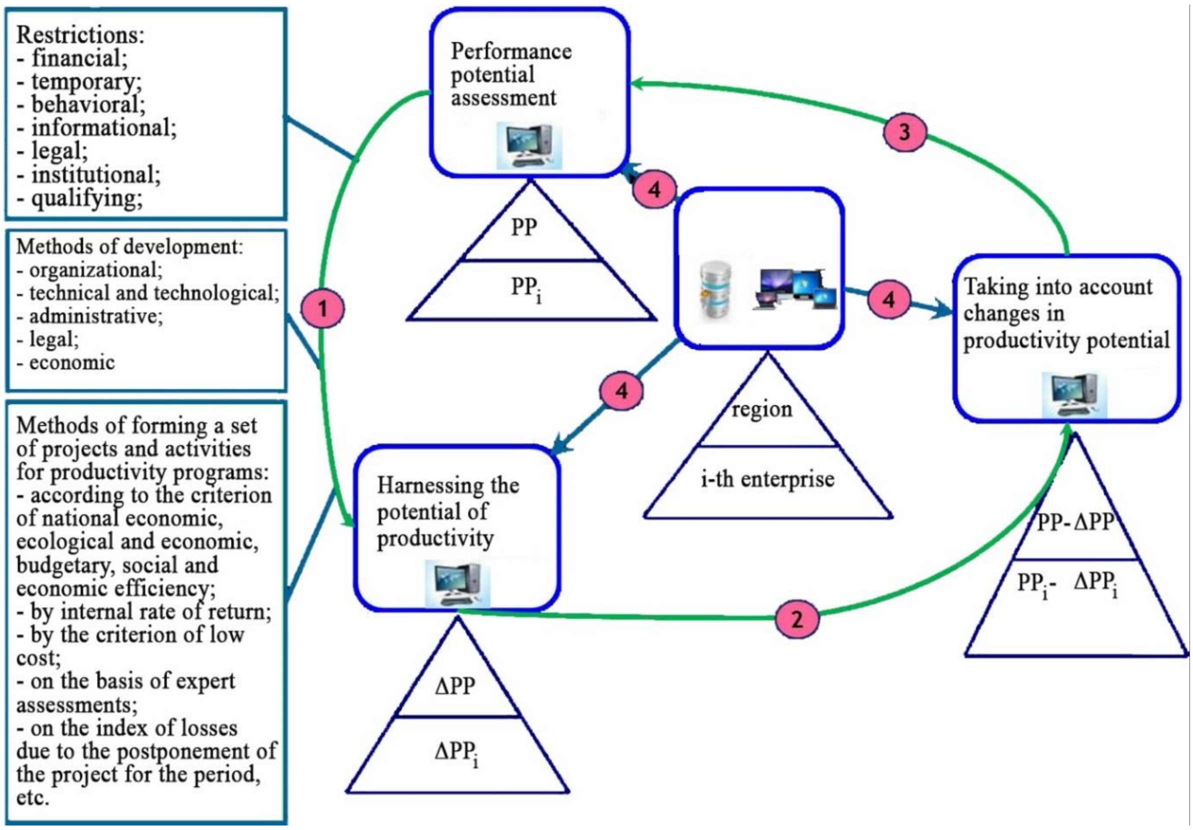

Figure 1. Scheme of interaction of the concept's main elements

In this concept, the increase in the productivity of the socio-economic system can be considered as a result of the implementation of a set of control actions on the potential of productivity at the regional level and at the enterprise level. Based on this, the scheme of interaction of the main elements of the concept includes capacity assessment, development of productivity potential and taking into account its changes (decrease due to development and increase due to scientific and technological progress) (Pavlov, 2007).

PP productivity potential evaluation is necessary to determine the value of the initial argument of control actions.

Harnessing the potential of productivity ΔPP is associated with the creation, implementation and adjustment of scientifically based scenarios of socio-economic system.

Taking into account changes in productivity potential PP - ΔPP and its components depending on volume and terms of carrying out the planned program actions taking into account available investments and methods of optimization of sequence of their implementation.

In the future, they measure the practical results of the work with the planned scenarios, adjust them and make the necessary management decisions to achieve the goals (Trutnev, 2011).

The results achieved need to be taken into account in order to further re-evaluate the productivity potential. This ensures the rapid exchange of information between the identified hierarchical levels (Gumerov et al., 2016), allows at any stage to identify priorities for the development of productivity potential and to adjust programs, subprograms and activity plans (Uraev et al., 2016).

Discussions

The theoretical foundations of the concept of productivity from the point of view of human resources and definition of the productivity are described in the works of O.A. Ermansky (1924), S.E. Kamenitzer (1955), M.E. Kunyavskiy, I.M. Kublin and K.O. Rasporov (2004), P.E. Petrochenko, I.A. Lyasnikov and G.N. Kholodnaya (1970), A.K. Tashchev and I.I. Prosvirina (2013), Kondubaeva et al, (2018), Mendoza & Mendoza, (2018), G.N. Cherkasov (2004) etc.

Theoretical aspects of solving a number of problems of increasing productivity, approaches to the assessment of total labor productivity as one of the components of productivity in a market economy are presented in the works of V.V. Adamchuk and O.V. Romashov (2001), V.N. Belkin and N.A. Belkina (2005), N.A. Volgin (1998), B.M. Genkin (2005), O.E. Germanova (1996), N.A. Gorelov (2002), V.M. Zubov (1990), E.V. Kuchina (2007), L.V. Labunskiy (2003), Y.G. Odegov, G.G. Rudenko and L.S. Babynina (2007).

Such domestic scientists as A.G. Bondarenko (2000), P.B. Gavrilov (1985), G.F. Mingaleev (2012), V.V. Novozhilov (1972), A.Yu. Petrov (2003), S.G. Strumilin (1982), S.S. Kudryavtseva et al. (2015), Yazdekhasti, A. et al. (2015), Kaithari, D. K. et al. (2017), M.V. Shinkevich et al. (2017) and others made a significant contribution to the justification of the need to increase productivity and its assessment.

In the writings of J. Kendrick (1984), A. Lawlor (1985), R. Kaplan and D. Norton (2008), I.I. Prokopenko (1990), D.S. Sink (1989), H. Emerson (1997) and other authors presented foreign approaches to the understanding of productivity, its assessment and management at different levels of management.

However, most scientists have explored other aspects of increasing productivity and its potential, proving that this is an important criterion of modern development, without which no socio-economic system cannot do without, seeking to gain a leading position among other similar systems. A comprehensive analysis of the works of scientists in this area leads to the conclusion that they have studied the issues of productivity either too widely (from the standpoint of macroeconomic growth and increasing the competitive advantages of the state), or rather narrowly (any specific resource as an element of productivity, for example-labor).

Conclusion

According to the results of the study, the following conclusions can be drawn:

The theoretical and practical significance of this study is in the formulation of problems: the enlargement and development of the concept of *productivity* from the perspective of resource and program-target approaches, taking into account the specifics of the national economy; classification of objects, socio-economic results of increasing the productivity of the socio-economic system and the means to achieve them, the theoretical development of methodological foundations for the assessment and consideration of the potential of the socio-economic system's productivity in the region; development of the conceptual framework for the evaluation and monitoring of productivity improvement as one of the main resources of the socio-economic system.

It is established that the productivity of enterprises in the region, and, as a consequence, the volume of output, can significantly increase through the implementation of targeted programs to improve the productivity of socio-economic systems at various levels of the economy (departmental, regional, And Federal).

Managers and specialists of economic entities of all sectors of the national economy can use the materials of the article.

Summing up, it is important to note that the results of this study can serve as a basis for identifying a number of scientific problems and promising areas that require further consideration: deepening and expanding some of the provisions set out in the article related to increasing the productivity of the socio-economic system.

Abstract

The relevance of the study is due to the need to use evidence-based approaches in the development of resource-saving programs at all levels of management based on the methodology of program planning, which is aimed at improving the effectiveness of national projects developed today in various fields of activity. The purpose of the article is to develop methodical aspects of energy efficiency measurement using modern approaches to the economic justification of engineering and technical developments. The leading approach to the study of this problem is the resource approach, which allows at the stages of justification and implementation of targeted energy saving programs to form a set of energy saving measures taking into account resource constraints. The main results of the study consist in the development of an approach to the ranking of activities within the framework of energy saving programs, which allows taking into account the economic losses associated with the lack of the possibility of developing the energy saving potential of each project when ranking energy saving projects. The significance of the results obtained is that the scientific toolkit is developed, including a method of forming and determining the sequence of measures' implementation, taking into account the ranking and time optimization of the totality of existing energy-saving projects, which is based on the fundamental principles of existing methods of financial and economic analysis of investment projects, including in the field of energy saving. The practical significance of the study lies in the fact that the proposed method allows the development of energy saving programs to ignore the factor of subjectivity inherent in the widely used method of expert evaluations. The results of the study are intended for use in the formation of methodical and regulatory framework of activities in the field of resource conservation, preparation of organizational and economic mechanisms for the implementation of projects and programs to improve energy efficiency.

Keywords: energy saving, program and target planning, expert evaluation, return on investment, ranking of energy saving projects.

Introduction

1.1. Relevance of the Study

The impact of scientific and technological progress on the rational use of resources is manifested mainly in two directions. On the one hand, there are many opportunities for the development and production of new types of raw materials and materials with improved technical and economic parameters, rational use of fuel and energy resources, on the other-there are prerequisites for technical re - equipment and expansion of the boundaries for technological processes improvement of raw materials and energy production (Mingaleev, 2006; Eisvandi et al, 2015; Jurenoks et al, 2017; Tang & Chen, 2019). This involves the implementation of measures, including the development of a measures' program) to create a rational structure of consumption of raw materials, and materials, improve working conditions, environmental protection, etc. In turn, scientific and technical progress, stimulating an increase in the production of material resources, at the same time causes a relative decrease in the need for them as a result of reducing the specific consumption of raw materials, materials, fuel and energy, the introduction of advanced technologies and various types of products, etc.

The first phase of each targeted integrated program involves the definition of the General goal and target attitude, representing the concept of targeted comprehensive program. Then the formation of sub-goals and objectives, considered by the level of importance and in the sequence of their achievement, according to which the composition of the performers of the targeted complex program is formed.

Formation of the goals of the lower level is carried out based on analysis and examination of energy-saving projects with the identification of indicators characterizing the economic feasibility of each event (Mingaleev, 1999). However, for example, the subprogram may include a set of activities in different sectors of the territorial economy:

– industry;
– construction;
– transport;
– agriculture;
– Housing and communal services, etc.

At the lower level, the quantitative characteristics of the sub-goals of the energy saving program are determined, which are related to the issues of assessing the economic efficiency of each activity and bind each sub-goal to financial resources.

At the same time, the set of sub-goals of the energy saving program should fully reflect the General goal.

Determining the importance of each sub-goal of the energy saving program, depending on the possible contribution to the achievement of the General goal, is required for the subsequent assessment of the sequence of implementation of energy saving measures. To do this, it is necessary to assess the importance of the sub-goal to achieve the General goal. Different approaches are also possible. These approaches (methods) to the ranking of energy saving measures should be discussed in more detail.

2. Methodological Framework

Methodological apparatus of research

The methodological basis of the study is the program-target approach (Koshkin & Mingaleev, 2003) to the formation of a complex of resource-saving measures, the development and effective implementation of programs in this area. In the process of research the following research methods were used: analysis of legislative and normative-legal acts; critical analysis of approaches to ranking of energy-saving programs' activities, multi-criteria analysis of objectives' significance; analysis of the possibilities of using indicators when assessing economic efficiency, the examination and selection of projects aimed at energy saving, the generalization of the results of energy saving projects for individual sectors of the national economy.

2.2. Object of Research

Projects and programs of energy saving, programs of social and economic development of territories, branches and separate enterprises were the object of research.

2.3. The Study Stages

The study was conducted in three stages:

– at the first stage, the current state of energy saving in economic theory and practice, the reasons for the slow development of energy saving potential, sources of financing and existing restrictions in the formation and implementation of programs at all levels of management, methods for determining the sequence of implementation of a set of energy saving projects were analyzed;

– at the second stage, a critical analysis of approaches to ranking energy saving measures, determining the importance of sub-goals of energy saving programs, generalization and analysis of existing methods for assessing economic efficiency and selection of investment projects for energy saving, determining the conditions for making a positive decision on energy saving projects on the basis of the given economic criteria;

– at the third stage, the feasibility of using the proposed indicator of the energy saving potential of the project as a criterion indicator in assessing the economic efficiency and ranking of energy-saving projects was justified, the essence and sequence of application of the method for formation and determination of the sequence of measures' implementation taking into account the ranking and time optimization of the set of existing energy-saving projects were clarified.

3. Results

3.1. Current State of the Problem under Study

In General, the economic efficiency of energy saving can be judged by the fact that the investments required for this purpose are 2.5-8 times less than those required for the production of an appropriate amount of energy; the costs for the development of fuel production and production of thermal and electric energy are more than 5 times more than for energy saving. Despite this, the process for formation and implementation of energy saving programs in the regions of the Russian Federation has significant prospects. The reason for the slow development of energy saving potential is the limited funds and the lack of effective organizational and economic mechanisms for the implementation of energy saving programs, which should be reflected in the likely energy saving scenarios. Financing of energy saving programs is expected at the expense of Federal, Republican, local budgets, investors' funds, enterprises' own funds, expected future energy savings (Salimov & Mingaleev, 2012; Mussabekov et al, 2018).

Thus, on the one hand, we have financial constraints in the formation and implementation of programs; on the other hand, the delay of their implementation is fraught with significant economic losses. Selective financing of projects and activities directly or indirectly containing energy - saving effect, the main purpose of which is the creation of demonstration zones or their haphazard replication, cannot be a guarantee of an effective investment policy in this area and does not allow to achieve the main goal - the rational development of energy saving potential (Trutnev, 2011). Thus, it is necessary to use science-based methods of development of energy saving potential, allowing reducing economic losses in the formation and implementation of energy saving programs.

3.2. Approaches to Ranking Events

In one of the widespread approaches to ranking, the priority of implementation within the framework of energy saving programs is given to activities that do not require large investments (Pavlov 2007). The condition for decision-making on a set of energy-saving projects within the framework of the energy saving program is the expression:

$$I_k < I_{k+1}, \qquad (1)$$

where k - the rank of the project.

Thus, the specificity of this approach, which for comparison can be considered in the development of energy saving scenarios, is to determine the importance of the goals, followed by ranking activities based on the criterion of least cost. In this case, the rank of the event is determined by the required amount of investment for its implementation. The smaller the volume of investments, the higher the rank of the energy saving project (Shinkevich et al., 2018).

The second approach is a group assessment of the importance of each sub-goal of the program. A pretty simple the method of individual expert evaluation with the subsequent averaging, which for comparison with other approaches to ranking used in the development of scenarios of energy saving which allow eliminating some of the characteristics of subjective uncertainty got the greatest distribution for the group peer assessment. When using this method, the calculation of the priority of the final sub-goals in relation to the General goal is carried out according to the known formula:

$$\omega_j = \prod_{x \in S_j} \eta_x, \; j \in M \, , \qquad (2)$$

where η_x- priority of each sub-goal,

ω_j - Priority factor of the j-th event in relation to the General goal,

S_j - Many goals on the way from the final sub-goal to the General,

M - A lot of final sub-goals.

In this case, the sum of the coefficients within any Bush of measures should be equal to one:

$$\sum_{j \in M} \omega_j = 1 \qquad (3)$$

To assess the significance of the goals in the conditions of multi-criteria (the existing set of defining quantitative characteristics of the event), convolutions of criteria (additive, multiplicative, according to the limit values of the importance coefficients) are used, which are estimated by the vector of the significance coefficients, the dimension of which is determined by the number of criteria. If expert assessments are carried out under the conditions of the need to assess one criterion, for example, the contribution of an energy saving measure to the development of energy saving potential, the significance of the final goals can be determined by the formula (2). Ranking of measures for energy saving is carried out based on calculations of the coefficients of priority ω_j by assigning a rank to each of them (1, 2, ..., m, where m - is the number of events).

None of the considered approaches to the formation of a set of measures in the framework of energy saving programs does not consider when ranking energy-saving projects economic losses associated with the lack of the possibility of developing the energy saving potential of each project as a result of financial and time constraints. Before proceeding to their consideration, it should be borne in mind that at the present stage in the formation of a set of energy-saving investment projects one should take into account the level of institutional maturity in the field of energy saving in the Russian Federation and regions.

In the first case, the justification of energy-saving investment projects should be carried out according to a specially developed method (for example, using existing methodical approaches) which is approved by-laws for the development of investment projects for energy saving. In the second case, a set of energy-saving investment projects, developed according to the available and recommended methods of planning and justification, is examined in existing financial institutions to determine the reliability of the declared parameters of the project (Reznikov et al., 2016; Osman et al., 2018).

Generalization and analysis of existing methods for assessing economic efficiency and selection of investment projects show that the indicators of ranking projects to improve energy efficiency can be: net reduced effect (net discounted income) (in the economic literature, there are various designations and names of criteria for assessing economic efficiency and selection of investment projects. We will stick to the terminology and symbols used in the latest works of Russian scientists in the field of financial analysis.), the return on investment index, the rate of return on investment (internal rate of return), the payback period of investments (Gumerov et al., 2016). For objective selection of investment projects on energy saving to the above mentioned it is necessary to add an indicator that would generally take into account the expected economic effect from the project's implementation in the form of a likely reduction in energy consumption due to the development of energy saving potential.

Thus, the decision on energy saving projects in the examination of financial and economic efficiency of investments in the energy saving program, taking into account the above mentioned indicators, can be justified by a set of criteria and conditions presented in the table.1.

Table 1. Conditions for making a positive decision on energy-saving projects based on the above-mentioned economic criteria

Criterion	Condition
The net present effect	$NPV > 0$
Return on investment index	$PI > 1$
The rate of return of the investment	$IRR > r$
Investment payback period	$T \to t_{min}$
Energy saving potential of the project*	$\boldsymbol{PE_p \to max}$

* PE_p is calculated for each individual case in different ways; usually $PE_p = \Delta C_0 M$, where Δ - saving; C_0- energy consumption; M - scale of use. For example, savings in i-m year from the implementation of the device X in the program M = 1 PCs per node (m_{node} = 100 000) is 10% of the average monthly consumption C_0 = 1000 Вт ч. In this case, $PE_p = 0{,}1 \cdot 12 \cdot 1 \cdot 10^5 = 120\ 000$ kV·h; or in conventional units $PE_p = 120\ 000 \cdot 0{,}000086 = 10{,}322$ t c.f., or at the tariff 1 kWh = 26 cop $PE_p = 31\ 200$ rub.

In assessing the NPV one can account for the distribution of investments in the calculated periods, residual values and possible release working capital, inflation and risk premiums in the course of the project. Despite the dimensionless nature of the return on investment index, which allows for the same (or similar)

NPV values to select projects from a set of alternative ones, the use of this property of the indicator is not suitable for summing up the economic effects of the project implementation in the time aspect.

Using the rate of return on investment (internal rate of return) allows you to estimate the maximum allowable amount of costs (level of costs) that are associated with the implementation of the project. However, with possible changes in the price of capital sent to the investment process, the comparison of projects leads to the need to determine the "Fisher point" for which the net effect of the compared projects *is* $NPV=f(r)$ = *idem.* In this situation, the use of *IRR* may not be effective because to judge the priority of a project when it comes to r = *var* is possible only by values *NPV*. Without mentioning the complexities involved in the IRR iterative process definition, it should be noted that with a significant difference in projects but the absolute value of accumulated cash flows, it is almost impossible to conclude about the contribution of a project to capital growth and economic potential as a whole. In addition, IRR, unlike NPV, does not have the property of additivity.

One of the main drawbacks of using the payback period as a criterion for ranking energy-saving investment projects, in addition to its relativity (non-additivity) and the presence of undiscounted estimates (in the case of determining a simple payback period), is the lack of accounting for income subsequent to payback periods. In this case, the profitability of the project (including in terms of the possibility of increasing over time the amount of energy released during the project) fades into the background, and the determining factors are liquidity and risk reduction.

The feasibility of *PEp* as a criterion indicator in assessing the economic efficiency and ranking of energy-saving projects is obvious, since it characterizes the contribution of the claimed project to the rational use of energy resources, and can be calculated both in natural and in value units (in kilowatt-hours (kWh), gig calories (Gcal), mega joules (MJ) and so on.). This universal criterion from the point of view of development of potential of energy saving on specific types of energy resources allows to bring the specified units of measurement to tons (kilograms) of conditional fuel (t c.f.), expressed in coal or oil equivalent. Finally, using the current values of tariffs for types of energy, you can get the value of PE_p in ruble equivalent. Taking into account its dependence on the formation of price and other types of state policy, including the current cost of energy resources in the country, and Vice versa, the use of this indicator as one of the criteria for evaluating the effectiveness and selection of energy-saving projects becomes an economically justified necessity.

Proceeding from the stated, for practical application it is possible to offer a method of formation and determination of sequence of implementation of actions taking into account ranking and time optimization of set of available energy saving projects which is based on the basic principles of the existing techniques of the financial and economic analysis of investment projects including in the field of energy saving.

The essence of the first two stages is now widely consecrated in the scientific literature. The content of the third stage in accordance with the methodology of the program-target approach in the formation of a set of measures is determined by the need to assess the sequence of implementation of existing energy-saving projects in terms of financial and time constraints. The above-mentioned limitations are taken into account due to the fact that this stage includes a temporary optimization of investment distribution for alternative energy-saving investment projects. The main task of optimizing the sequence of their implementation is the quantitative determination of the evaluation criterion, which allows to judge the implementation of which of the alternative projects will be associated with the maximum (monetary, energy) losses for the recipient and the considered territorial entity as a whole, taking into account the amount of invested funds.

These losses are measured by the index reflecting the ratio of the decrease in the net discounted income in the following for the current period due to undeveloped nature of potential energy savings for a given time to the volume of investment in energy efficiency. Thus, the index of losses due to the postponement of energy-saving measures is the value of:

$$J_{PE} = \frac{\sum_{i=1}^{n} \frac{PV_i}{(1+r)^i} - \sum_{i=1}^{n} \frac{PV_i}{(1+r)^{i+1}}}{\sum_{i=1}^{n} \frac{I_i}{(1+r)^i}}, \tag{4}$$

Where I_i - discounted flow of investments in energy saving (RUB.),

r - Discount rate,

J_{PE} - index of losses due to the postponement of the development of energy saving potential from the current time to the next period.

When ranking energy-saving projects, this index should be used as follows: the greater the level of economic losses caused by the delay in the implementation of the relevant project, the higher its rank. Thus, this method allows you to ignore the factor of subjectivity inherent in the widely used method of expert evaluations.

The recommended index characterizes the economic losses of the recipient enterprise in case of postponement of the proposed event for a certain period. However, we should be interested in the losses of society, which it will suffer because of this delay. Taking into account the economic meaning of the method, the formula of the index of economic losses will be as follows:

$$J_{PS} = \frac{PS_i - PS_{i+1}}{\sum_{i=1}^{n} \frac{I_i}{(1+r)^i}} \qquad (5)$$

Here $(PS_i - PS_{i+1})$ - losses of the national economy due to the postponement of energy saving measures for the period (RUB.),

Wkere PS_i - national economic effect of energy saving, which can be obtained as a result of the introduction of energy-saving project for the current period (RUB.),

PS_{i+1} - national economic effect in case of postponement of the project for the period (RUB.);

J_{PS} - index of economic losses.

The current economic losses caused by the lack of consistent implementation of energy saving policies also require economic evaluation. It can be carried out by means of the received national economic indicator of ranking taking into account all items of income and expenses (decrease in the payment for environmental pollution, replenishment of the budget, etc.). Estimated by the indicator of undeveloped energy saving potential *PE* losses from a possible delay not only one, but also the entire available set of energy saving projects provide a more accurate assessment of the energy saving potential.

It is obvious that when using existing approaches to assessing the effectiveness and ranking of investment projects in relation to the problems of rational use of energy, such economic effects are difficult to see. Thus, the ranking of projects is carried out taking into account the development of energy saving potential in time, and the use of the method allows to achieve the main goal - the optimal development of energy saving potential in conditions of limited funds for it, as well as time constraints due to daily losses due to irrational use of energy resources.

Discussions

Theoretical, methodological, and practical problems of formation and implementation of projects in the field of energy saving are presented in the works of famous scientists: G.V. Degtev (2002), V.V. Elistratov (2001), K.G.Kozhevnikov (2000), Yu.D. Kononov, E.V. Galperova and O.V. Mazurova (2002), I.V. Kuznik, M.Yu. Tiunov and V.A. Bryukhanov (2001), B.L. Kurbatov (2004), A.V. Lyakhomski and B.Ya. Malyavin (2002), V.S. Samsonov and M.A. Vyatkin (2003) and others.

Approaches to solving the problems of improving the efficiency of energy saving and its evaluation were considered in the works of both Russian economists and foreign authors, among them: I. Ansoff (1999), V. Berens and P.M. Khavranek (1995), S.V. Valdaitsev (1997), O.S. Vikhansky (2002), G.S. Gamidov, V.G. Kolosov & N.Oh. Osmanov (2000), S.Yu. Glaziev (1993), N.Yu. Kruglova & M.I. Kruglov (2003), Mohd Beta, R. M. D., & Ali, K. (2017), I.I. Mazur and V.D. Shapiro (2003), G.F. Mingaleev (2006), etc.

Most scientists have also studied other aspects of improving the efficiency of energy saving and approaches to the development of its potential, proving that this is a really important direction of ensuring the competitiveness of economic entities in the conditions of stricter environmental requirements and existing resource constraints in the formation and implementation of energy saving programs at all levels of management.

Conclusion

Thus, the development of the target tree and their ranking is performed according to the above-mentioned research algorithm. At the same time, the more fractional will be the local goals, the more accurate reflection in the energy saving program will be found by the characteristics of time and financial resources for the implementation of the entire complex of energy saving measures.

The use of a set of energy-saving projects as a tool for temporary optimization allows us to determine the sequence of implementation of energy saving measures, taking into account financial resources and time constraints.

The development of scenarios for the implementation of the energy saving program and the choice of the best option from a variety of alternatives is carried out as a result of alternative justifications for the development of the energy saving potential with the determination of the rates for coverage of energy saving measures in the segment selected for the implementation of the energy saving program. At the same time, to improve the accuracy of the calculations they should be carried out in the widest possible range of basic parameters' change.

Detailed study of selected energy saving program, which is designed to be implemented, is carried out with reference to the schedules to reflect the intermediate and final deadlines of measures' implementation, identifying sources of funding, in accordance with the requirements of the process control system of energy saving for specific performers.

Abstract

One of the most important tasks to improve the efficiency of domestic enterprises is to minimize losses in production processes and to search for possible methods, tools and ways to eliminate them. To solve this problem, the concept of lean production is used. It is also worth noting that the existing level of production processes' organization in domestic enterprises in most cases does not allow them to adequately and timely respond to the rapidly changing conditions of economic activity, taking into account the presence of losses in the processes, which in turn adversely affects the efficiency of production systems as a whole. Therefore, in this paper, an attempt was made to combine existing information technologies and lean production tools at the industrial enterprise of JSC Kazan motor-building production Association, to obtain a synergetic effect that affects the growth of productivity of the enterprise, which is the novelty of this work. According to the results of the study, an adapted technique for calculating the overall efficiency of the equipment (OEE) was proposed, the total efficiency of the equipment was calculated based on the proposed technique and the results of OEE were obtained.

Keywords: organization of production, leanmanufacturing, labor productivity, information technology, overall equipment efficiency (OEE).

Introduction

1.1. The Study Relevance

The conditions of the market system raise a new question about the forms and methods by which it is possible to assess the result of the enterprise and the degree of their functioning. The relevance of this topic is that in a competitive environment the competitive economic entities are important not only to avoid the deficit, but also to develop successfully. This can be achieved thanks to competencies in the field of techniques, technology, Economics, management, for example, one of the concepts in the field of organization of production is lean production (LP), which is used in the production and non-production areas (Tastan & Davoudi, 2013; 2015; Parvizian et al, 2015; Malysheva et al., 2016; Uraev et al., 2016; Gumerov et al., 2016; Mingaleev et al., 2016; Mingaleev, Margulis & Kosterin, 2016; Shinkevich et al., 2017; Svistilnikov & Chinenov, 2017; Kadyrmetov & Labutin, 2017; Kumari & Alexander, 2018; Mingaleev, Kosterin & Lopatin, 2018; Alpeisso et al, 2018; Afriyani et al., 2018).

The purpose of this work is to develop recommendations for the implementation of LP tools in an industrial enterprise using available modern information technologies in the organization.

To achieve this goal it is necessary to solve the following tasks:

1. To calculate OEE based on the data of production processes;
2. To describe and adapt the technique for calculation of OEE at the investigated industrial enterprise of JSC *Kazan motor-building production Association*;

3. to analyze the improvements after the implementation of LP tools at the industrial enterprise of JSC *Kazan motor-building production Association* with the use of modern information technologies available at the enterprise.

Methodological Framework

2.1. Methodological Apparatus of the Study

The methodological basis of this study is a system-based approach to the effective implementation of program measures to improve the efficiency of production processes' organization and elements of Lean Production's concept in terms of search, identification and analysis of losses in the production activities of the enterprise.

2.2. The Study Object

The object of the study is the site №6 of the machining processing shop №2 in industrial enterprise JSC *Kazan motor-building production Association*, and the subject – methods and tools of LP, namely the calculation of the overall efficiency of the equipment (OEE) (Salimov & Mingaleev, 2012).

2.3. The Stages of the Study

The study was conducted in three stages:

– at the first stage – the preparatory stage – the toolkit of the adapted technique for calculating the overall efficiency of the equipment (OEE – Overall Equipment Effectiveness) was formed);

– At the second stage – the main stage-losses on the specific equipment were identified, taking into account data on planned Fund of operation of the equipment;

– At the third stage – the final stage-recommendations were developed, including the introduction of automated calculation of the OEE on the Numerical control lathe Leadwell F1, which led to: reducing the duration of downtime, by eliminating such a loss as *the cause is not established*, increase the volume of production by quickly identifying and responding to downtime when they occur (Mingaleev, Margulis & Kosterin, 2016).

Results

3.1. Formation of Toolkit of the Adapted Technique

The total efficiency of the equipment (OEE-Overall Equipment Effectiveness) is one of the ways to monitor the equipment and improve its efficiency. This indicator is generally calculated according to the following formula:

OEE = Availability (A) * Performance (P) * Quality (Q) * 100%, (1)

where:

Availability – (A) - the actual time during which the equipment was ready or available to perform the work;

Productivity – (P) - the actual time spent directly on the processing of products;

Quality (Q) – the actual time spent on the production of suitable products.

We present a table of losses that affect each component of the overall efficiency of the equipment (table. 1):

Table 1. Classification of losses for each component of OEE

Constituent of OEE	Losses on each OEE indicator	Loss examples
Availability	Planned downtime	Installation and configuration of equipment, Autonomous maintenance (cleaning), readjustment.
	Unplanned downtime	Breakdowns, equipment repair, tool replacement
Pproductivity	Losses due to suspensions and idling	Idling, human factor
	Loss due to reduced speed	Equipment operation at speed below the rated one
Quality	Losses due to defects and rework	Revision of details, an incorrect configuration (build)
	Losses at hardware startup	Damage in the process

The planned Fund of equipment operation is presented in table 2:

Table 2. Planned Fund of the equipment operation

<table>
<tr><td>Time, min.</td><td colspan="3">Useful time, min.</td><td>Bad time, min.</td></tr>
<tr><td>T (pfo)</td><td colspan="4">Planned Fund of the equipment operation</td></tr>
<tr><td>T (atr)</td><td colspan="3">The actual time during which the equipment was ready to perform the work</td><td>Losses are not value-adding (NVA) and non-value-adding but necessary (NVAN), T (r)</td></tr>
<tr><td>T (att)</td><td colspan="2">The actual time spent directly on treatment products</td><td>Productivity losses, T (t)</td><td></td></tr>
<tr><td>T (atp)</td><td>Actual time spent on production of usable products</td><td>Defects, T (d)</td><td></td><td></td></tr>
</table>

Availability (A) of equipment is calculated by the formula:

$$A = \frac{T\ (atr)}{T\ (pfo)}. \quad (2)$$

Productivity (P) is calculated by the formula:

$$P = \frac{T\ (att)}{T\ (atr)}. \quad (3)$$

Quality (Q) is calculated by the formula:

$$Q = \frac{T\ (atp)}{T\ (att)}. \quad (4)$$

On the considered Leadwell F1 equipment, losses are determined, the classification of which is presented in table 3 (Valitov et al., 2017; Mingaleev, 2012):

Table 3. The classification of losses on equipment Leadwell F1

Number	Losses
1.	Clarification of the controller program
2.	Equipment repair required
3.	Technological stop
4.	Tool/equipment selection
5.	The reason is not established
6.	installation of equipment
7.	Clarifying the parameters of the control program
8.	Clarification of the process
9.	Missing part/workpiece
10.	Missing tool
11.	Equipment is switched off
12.	Regulated rest
13.	technical control Department operation
14.	Central measuring laboratory control
15.	Coordinate measuring machine control

Production losses of equipment can be classified as follows: losses associated with the repair and shutdown of equipment (unpreparedness of equipment); losses associated with the implementation of the production process (Bikmullin et al., 2018; Bakeeva et al., 2018).

The grouping of losses due to their occurrence is presented in table 4:

Table 4. Grouping of losses due to their occurrence

Number	Losses are not value-adding (NVA) and non-value-adding but necessary (NVAN), T (r)	Causes of productivity losses, T(t)
1	Clarification of the control program	technical control Department operation (TCD)
2	Equipment repair required	
3	Technological stop	
4	Tool/equipment selection	Central measuring laboratory control (CML)
5	Regulated rest	
6	installation of equipment	Coordinate measuring machine control (CMM)
7	Clarifying the parameters of the control program	
8	Clarification of the process	The reason is not established
9	Missing part/workpiece	
10	Missing tool	
11	Equipment is switched off	

Based on reports on shifts and the above-mentioned approach, we will calculate OEE components per day (table 5):

Table 5. Calculation of OEE per day

Name of parameter	Calculation formula	1 shift, min.	2 shift, min.	3 shift, min.	Availability per day
1	2	3	4	5	6
Condition including time in the planned operation Fund		yes	yes	No	
1.T (pof)	T (pof)	540	480	420	1020
2. T(r)	T(r)	89,48	146,75	395	236,23
3. T (atr)	T(atr)=T(pof) -T(r)	450,52	333,25	25	783,77
4. Availability (A)	A=T (atr)/ T (pof)	0,83	0,69	0,06	0,77
Name of parameter	Calculation formula	1 shift, min.	2 shift, min.	3 shift, min.	Productivity per day
Condition including time in the planned operation Fund		yes	yes	No	
1. T (atr)	T (atr)	450,52	333,25	25	783,77
2. T(t)	T(t)	99,55	0	16,44	99,55
3. T (att)	T(att)=T(atr) -T(t)	350,97	333,25	8,56	684,22
4. Productivity (P)	P= T (att)/ T (atr)	0,78	1,00	0,34	0,87
Name of parameter	Calculation formula	1 shift, min.	2 shift, min.	3 shift, min.	Quality per day
Condition including time in the planned operation Fund		yes	yes	No	
1. T (att)	T (att)	350,97	333,25	8,56	684,22

2. T(d)	T(d)	0	0	0	0
3. T (atp)	T(atp)=T(att) - T(d)	350,97	333,25	8,56	684,22
4. Quality (Q)	P= T (atp)/ T (att)	1,00	1,00	1,00	1,00

Visually, the work of the first and second shift can be represented as a Gantt chart (Fig.1-2), where 1 – Equipment is switched off, 2 – Technological stop, 3 – The reason is not established, 4 – treatment on the task and 5 – Tool/equipment selection.

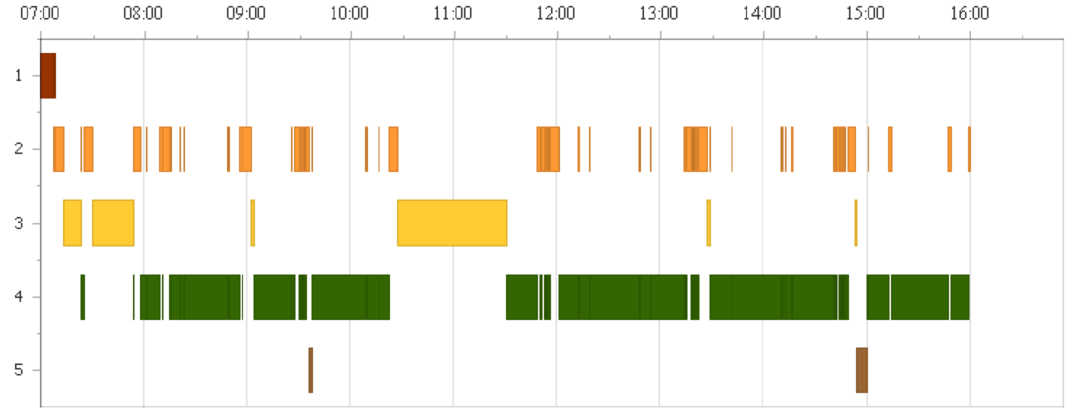

Figure 1. Report on the operation of the equipment in the first shift

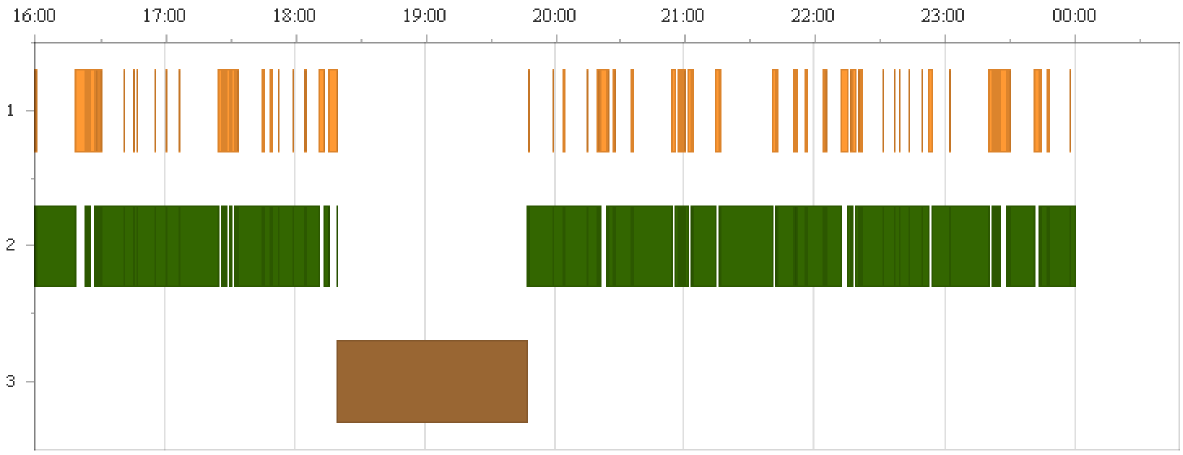

Figure 2. Report on the operation of the equipment in the second shift

After the shift calculation of the OEE, the calculation of the OEE indicator for the month of the equipment operation was carried out (23 days – the actual Fund of working time in the study period) (table. 6).

Table 6. Calculation of OEE per month

Name of indicator	Amount per month
1	2
1. T (pfo)	17880
2. T(r)	4535,9
3. T (atr)	13344
Availability (A)	0,75
1. T (atr)	13344

2. T(t)	2037,42
3. T (att)	11306,6
Productivity (P)	0,85
1. T (att)	11306,6
2. T(d)	0,00
3. T (atp)	11306,6
Quality (Q)	1
OEE	0,63

As can be seen from table 6, availability (A), productivity (P) and quality (Q) for the month were 0.75, 0.85, 1, and OEE = 0.63 or 63%, respectively, indicating insufficient equipment utilization.

3.2. Loss Identification

Analysis of losses in a month based on report of download work center Leadwell is presented in figure 3.

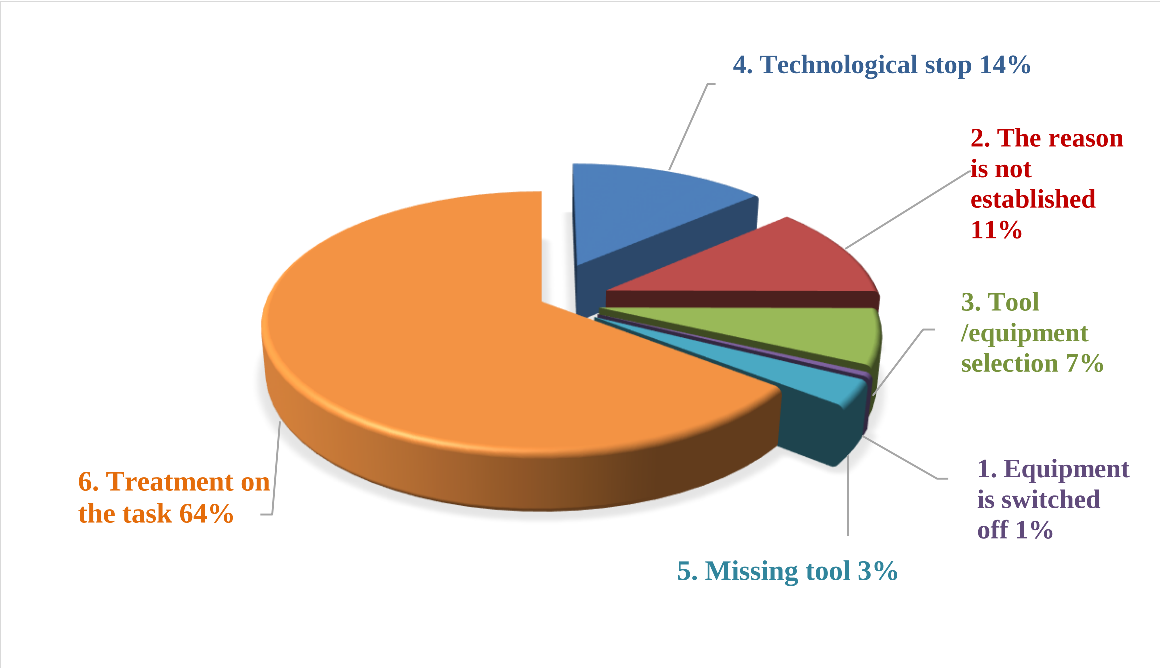

Figure 3. The distribution of losses by type for the month prior to the implementation of measures

Fig. 3 main losses are concentrated in three sectors:

1. The reason is not established – it is the loss associated with the human factor;

2. Technological stop is the loss associated with equipment shutdown that lasts less than five minutes, but is often repeated;

3. Tool/equipment selection is carried out – it is the losses connected with search, the choice of tools and equipment.

The article gives a practical example when losses *the reason is not established* were analyzed and eliminated. This reason will be eliminated by automated calculation of the overall equipment efficiency (OEE).

Calculation of production costs for five types of losses in rubles on the LEADWELL F1 equipment for the month before the implementation of measures will be carried out according to the following formula (Bakeeva et al., 2018):

$I = tc*k*T,$ (5)

Where: I-production costs, expressed in losses of the production process, rubles;

tc - existing losses, min;

k- The cost of overheads of the shop, RUB;

T-calculation period (number of months).

Calculation by types of losses:

1. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1due to the stop of the equipment, which lasts less than five minutes, but often repeated (technological stop) (Nadreeva & Abramov, 2018; Bakeev et al., 2018):

I1 = 2410, 57*1*12 = 28 926, 84 RUB.

2. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the human factor:

I2 = 2031, 54*1*12 = 24 348, 48 RUB.

3. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the search, selection of tools and equipment.

I3 = 1216, 32*1*12 = 14 595.84 RUB.

4. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the off equipment.

I4 = 85, 31*1*12 = 1 023, 72 RUB.

5. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the lack of tools.

I5 = 554*1*12 = 6 648 RUB.

Total losses: 28 926, 84+24 378, 48+14 595, 84+1023, 72+6 648 = 75 572, 88 RUB per year on this machine.

Calculation of four types of losses (due to the introduction of automated calculation of OEE) in rubles on the equipment LEADWELL F1 for the month after the implementation of measures:

1. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1 due to stopping equipment, which lasts less than five minutes, but often repeated (technological stop):

I1 = 2410, 57*1*12 = 28 926, 84 RUB.

2. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the search, selection of tools and equipment.

I2 = 1216, 32*1*12 = 14 595.84 RUB.

3. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the off equipment.

I3 = 85, 31*1*12 = 1 023, 72 RUB.

4. Loss of working time among the main production workers in the machining shop №2, on the sixth section, on the Numerical control lathe Leadwell F1, associated with the lack of tools.

   I4 = 554*1*12 = 6 648 rubles.

   Total losses: 28 926, 84+14 595, 84+1023, 72+6 648= 51 194, 40 RUB per year on this machine.

The cost of the event was determined as follows: the introduction of automated calculation of OEE requires the work of two programmers. The average salary of programmers in the field of C-sharp (programming language) in Kazan is 50 000 rubles (Gareev & Kirshin, 2013).

The duration of this event, according to programmers, is 3 months. After counting: 50 000*2^{*3} = 300 000 rubles

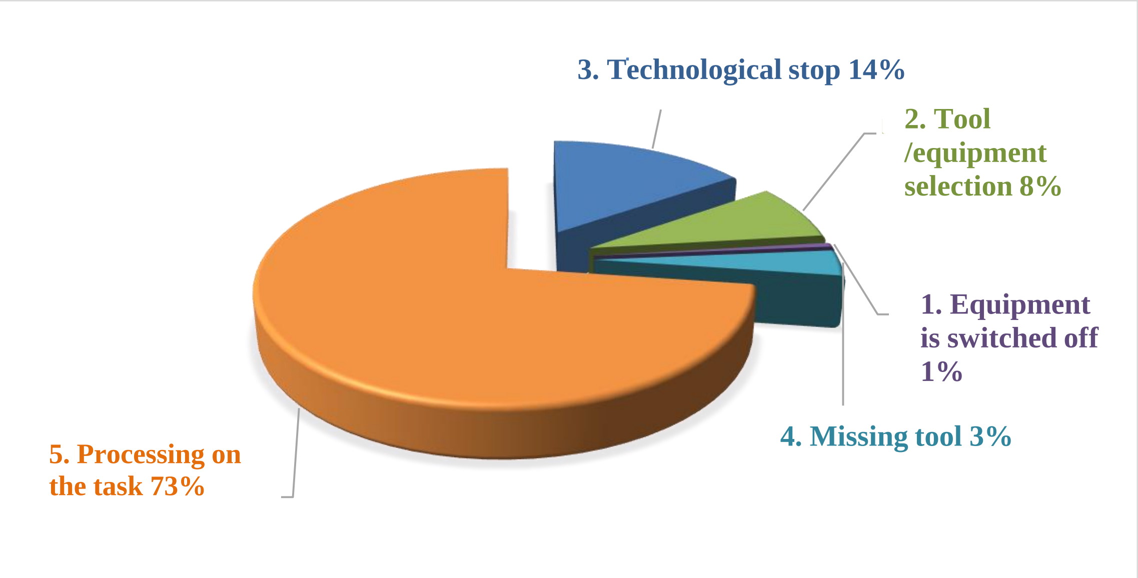

Figure 4. Distribution of losses by types for the month after the implementation of measures

The payback period for the implementation of the OEE automated calculation was 13 months.

Conclusion

According to the results of the study, the following conclusions can be drawn:

Lean production involves carrying out activities with minimal investment, but where LP tools are powerless, it is possible to use modern information technologies that require certain costs, but pay off over time.

The article for OEE calculation proposes the adapted technique of calculation, which involves identification of losses on specific hardware based on the data on planned Fund operation of the equipment; the group loss for 3 indicators (availability, performance and quality). The study first gave an example of the calculation of the OEE based on the report of the first and second shift, which was 0.64 and 0.69. Then the example of calculation of an OEE for a day, which was 0.67, was given. Based on these calculations and the above-mentioned technique, it was 0.63 or 63% for the month.

Based on the results of the OEE calculation, recommendations for the introduction of automated calculation of the OEE on the Numerical control lathe Leadwell F1, using the data of production processes were formed. Implementation of these recommendations at the enterprises will lead to: reducing the duration of downtime, by eliminating such a loss as *the cause is not established*; increasing the volume of production by quickly identifying and responding to downtime when they occur (with the help of a specialized module for sending e-mail, SMS alerts, which is built into this system).

Next, the paper presents the calculation of costs for the types of losses in RUB on the equipment of the model LEADWELL F1 for a month. Costs before and after implementation of activities amounted to 75 572, 88 51 RUB and 194, 40 RUB, respectively.

To visualize the ratio of actions that add value and losses for the period from 02.04.2018 to 25.04.2018, diagrams were built showing the change in the percentage of actions that add value before and after the implementation of the event.

The main results of the work are the following: reduction of downtime during the implementation of the event by 9%, increase in the number of operations that add value by 9%, the economic effect of the event on the test equipment will be 24 378.48 RUB per year, the payback period of the project for the introduction of automated calculation of OEE at the enterprise was 12 months and 9 days, and the discounted payback period - 13 months and 16 days, which indicates the high attractiveness of the project and the need to replicate the experience for other divisions of the enterprise.

Abstract

The relevance of the study is to study the individual characteristics, psychological and emotional States of elderly people in the nursing Home. It is important to study the possibility of socio – psychological training program for the elderly adaptation to the conditions of nursing Home. The leading method of this problem research are the following: the methods of unfinished sentences and author's methods, allowing to highlight a number of negative and positive aspects in the process of older people adaptation to new living conditions. The authors revealed that the socio – psychological accompany (socio – psychological training, psychological counseling of the elderly and their staff) will contribute to the favorable adaptation of the elderly to the conditions of the nursing Home. The data obtained in the work can be used in medical centers, nursing homes, practical psychology, sociology, medical psychology, as well as for further theoretical development of this issue.

Keywords: old age,nursing Home,gerontology

Introduction

The ageing of the population as a phenomenal socio-demographic process is inevitably a matter of concern for all countries. This problem is also relevant for Russia-the policy of social support for the elderly reflects the essence of any society and state, regardless of the political system. A new type of age structure poses serious socio-economic, moral and psychological challenges to modern society.

In recent decades, both foreign and domestic scientists have studied various aspects of the life of the elderly.

Many scientists have studied social and psychological problems of gerontology (Antsyferova, 1993; Alexandrova, 1974; Khrisanfova, 2002; Yatsemirskaya & Belenkaya, 1999). These researchers note that there are features of aging: normal, pathological and optimal processes, as well as interpersonal diversity (heterogeneity) of the elderly population.

They considered aspects of assistance organization to the elderly in their grief and depression about the loss of friends and relatives (Guslyakova & Popkova, 2000; Ananiev, 1991; Giessen, 1980; Ermolaeva, 2002; Tastan & Davoudi, 2013; Ardakani et al, 2015). They note that in cases of loss, the elderly and old people undoubtedly fall into a high-risk group, become very dependent on medical, social and economic services and especially need psychological support.

Various aspects of the elderly adaptation to old age are studied in detail (Aries, 1992; Satina, 2001; Shulepikov, 2000). These researchers note that in the approaches to adaptation, they should be flexible; to address potential reserve abilities of older people; to take into account the peculiarities of the psyche of the older person.

The researchers also note that the peculiarity of the current situation in this country is that *getting into old age* occurs against the background of a decrease in the standard of living of many people, and this often entails not only poverty and economic dependence, but also excessive deterioration of health, thereby exacerbating social isolation, mental and psychological distress (Torinston, 1999; Satina, 2001; Tutushkina, 1998).

Actively developing element of social policy in modern Russia is social work with the elderly. Specialists in working with the elderly believe that in order to learn how to provide effective and qualified assistance to old people, an individualized approach to everyone is necessary (Zworykin, 1992; Karsavskaya & Shatalova, 1998; Kozlov, 1995; Cherdymova 2011; Krasnova, 2005; Syam et al, 2017).

These aspects of work with elderly people become particularly relevant in special conditions, when elderly people move to a *nursing home* for various reasons (Firsov & Studenova, 2000; Stuart-Hamilton, 2002).

The situation of forced resettlement in new, different from home, unusual conditions of social relations, can inevitably be accompanied by a deterioration in psychosomatic health - an exacerbation of many diseases, an increase in the level of anxiety, aggression and frustration. The inevitable companions of these phenomena are insomnia, apathy, anxiety, anger, irritability, depression, etc. Therefore, timely social and psychological assistance can contribute to a less painful adaptation of the elderly in a *nursing Home*, adaptation to a new social environment. Traditionally, there are three gradations of the period of gerontology-genesis: elderly age (for men – 60 – 74 years, for women – 55 – 74 years), senile age (75 – 90 years) and centenarians (90 years and older). However, modern research shows that the aging process has slowed down in recent decades. A person in 55-60 years may not feel old at all and may be among Mature people in terms of social functions, and the aging itself within these phases is not uniform - someone gets tired of life by the age of 50, and someone in 70 years can be full of strength and life plans (Roshchak, 1990; Tutushkina, 1998; Shorokhova, Lomova & Zhuravleva, 2004; Mailybaev et al, 2018).

Aging is usually considered as a process consisting of three components:

1). Biological aging is the increasing vulnerability of the body and the increasing probability of death.

2). Social aging-changing patterns of behavior, status, roles.

3). Psychological aging-the choice of ways to adapt to the aging process, new strategies to overcome difficulties (Krasnova, 2005; Ermolaeva, 2002; Giessen, 1980; Aries, 1992; Antsyferova, 1993).

Materials and Methods

2.1. Methods of the Study

The following psych diagnostic techniques were used:

1. The technique for diagnostics of mental States self-assessment (G. Eysenck) was used to identify old peoples' levels of anxiety, frustration, aggression and rigidity. The technique allows identifying self-esteem, attitude to failures and difficulties, the degree of restraint in relationships with others, reactions to changes in the social situation.

2. Stress resistance and social adaptation was revealed by the technique of Holmes and Raga. Studying the dependence of diseases (including infectious diseases) on various stressful life events, Holmes and Raga revealed that mental and physical diseases are usually preceded by certain serious changes in human life and the reaction (adequate or inadequate) of a person to them. This technique was used to identify the degree of stress resistance of elderly.

2.2. The Experimental Base of the Research

The study was conducted based on *nursing Home*. The sample of subjects was 28 people aged 65 to 85 years.

2.3. The Study Stages

The study of the problem was carried out in three stages:

Stage one - development of initial positions based on theoretical analysis of the literature on the subject of research; development of a General concept of the study, which includes methodological principles and a project to develop a research tool.

Stage two - development of the research tool.

Stage three - a sample was formed, empirical data were collected. Preliminary results were obtained. Analysis and interpretation of the results was made.

1) The first stage included diagnosis of self-mental conditions of the elderly (G. Eysenck) and their stress resistance. (The quantitative characteristics of the individual indicators are given in Table 1), the percentages are presented in table 1.

Table 1. Results of anxiety and stress resistance study

Levels	Anxiety	Frustrating	Aggress	Rigidity	Stress resistance
	% ratio				
High	51 %	51 %	47 %	13 %	9 %
Average	37 %	40 %	42 %	44 %	30 %
Low	12 %	9 %	11 %	43 %	61%

Qualitative analysis of the results is as follows:

As can be seen from the table, a high level of anxiety was detected among 51% of the elderly, average anxiety rates - among 27% and low rates - among 12% of the subjects.

As for frustration, a high level was also found in 51%. Probably, these elderly are characterized by low self-esteem, avoidance of difficulties, and fear of failure. The average level was found in 40% and the low level was only in 9% of the elderly. Thus, only 9 % have high self-esteem and are resistant to difficulties.

Aggressiveness and high unevenness in the relationship was revealed in 47 %, the average level – in 42 %. Low level, calmness and restraint in the relationship was found only in 11 % of the elderly. A high level of rigidity was found in 13 %, in this case, with any rehabilitation measures, positive dynamics might be difficult. The average level of rigidity was revealed in 44 %, and the low level was revealed in 43%, which allows us to hope for the possibility of positive changes in the process of rehabilitation work.

Results of stress resistance and social adaptation determination look as follows: high stress resistance was found only in 9 %. The average level was found in 30 % and low - in 61 % of the elderly. Among the most prominent reasons, which in the last year led to dire sufferings of older called: the death of a spouse 27 %, a forced rupture (separation) with partner - 18 %, injury (disease) – 60 %, change in financial status – 54 %, problems with family – 48 %, the change of living conditions, 57 % and change of habits related to nutrition (downside) – 48 %, rejection of any personal habits (due to the dissatisfaction of children and loved ones) – 57 %.

Further, the whole sample was divided into two identical groups, but in the experimental group, we included according to the diagnostic data the most stress-prone elderly taking into account, at the same time, and their personal wishes. The rest of the subjects were a control group. For greater efficiency of experimental rehabilitation work, each participant of the experimental group was interviewed to identify the causes (factors) of anxiety and stress. Based on these interviews, some common factors emerged:

1. Anxiety due to changes in the situation was detected in 72% of the sample.
2. 36% of them indicated inability and unwillingness to communicate with other vacationers (hostility and negative attitudes). They also revealed alexithymia.
3. The desire for, and doubts about, the necessary and effective care has also been a source of anxiety.
4. In 66% of the sample, doubts about the *humanistic attitude* of the staff towards them were a factor of anxiety.

Along with the common factors emerged personal reasons for anxiety:

1. The children and grandchildren stayed at home.
2. Anxiety and fear of the last *transition*.

With these campers, we used individual counseling. In order to at least to some extent eliminate the common factors that cause anxiety, we have prepared a number of conversations on the ability to communicate, the ability to engage in auto-training, conversations about stress management, etc., with all the elderly. A specially designed seminar with medical and service personnel was held on the theme *the influence of the relationship style of medical staff on the convalescence of the patient.*

Results

One can give examples of the main stages of the experiment.

The first and second sessions were devoted to familiarity of the training participants with each other, with the rules of further work; mainly exercises for defrosting and acquaintance were used. The work was quite difficult, although the participants themselves expressed a desire to participate. When speaking about the expectations of the participants, it turned out that they were mostly people which in their families and in relations with relatives were tired of manipulation, suffered from unceremonious relations and criticism from family members. The most popular tactic in the relationship was *leaving*. It was these kinds of factors that led to outbreaks of aggression and the suppression of these outbreaks within themselves that aggravated the painful conditions.

The following classes were basic and were devoted to identifying situations of manipulation and mental trauma and practicing a variety of effective communication skills. Very interesting material for further work was received and recorded on tape with the use of unfinished sentences, which were to be completed by the participants of the training.

Here are the most striking statements obtained with the use of unfinished sentences:

"I feel powerless when my teenage grandson begs me for a pension,"; "I feel powerless when I have to stand in a pharmacy queue,"; "I feel furious when my daughter – in-law does not listen to me and just shuts me up."

"I get angry when children start talking about who will get the living space ... when relatives do not consider me and do everything in their own way .... when they limit my diet, although I give them my money, etc."

"What I sometimes really want is to have good food - fruit, ice cream, ... I want to be respected,.....to have opportunity to talk to someone spiritually and mentally,.....watch on TV not those programs that my grandson wants, but those which are interesting for me, etc. "

"I especially don't like it when I'm often escorted to distant relatives, when the house is arranged gatherings."

"I'm familiar with an acute sense of loneliness. I remember lying in the hospital and to everyone came someone to visit every day, and to me only once a week."

"I really want to forget that there are even more difficult years ahead, and I ask the God for an easy and quick death.... "

"Even close people sometimes do not understand me. I once tried on a family holiday to Express my heartily wishes and as usually, I was sent to other relatives"

"I have had occasion to show cowardice. In order to keep relationships with loved ones usually I agree with everything, although I do not like much".

"Especially irritates me that not only strangers, but and relatives sometimes treat me rudely", "I feel that I annoy every-body at home and that they dream to get rid of me finally...."etc.

In the following classes, the skills of confident behavior were tested with the help of "I – messages". Exercises on the development of the ability to perceive criticism from the outside were performed quite difficult, as the elderly reacted very painfully and, apparently, this pain was developed over time. However, the responses with the use of humor they used more readily. After each lesson, feedback was provided.

At the last lesson parting words were given. At the end of all classes, each participant filled out a questionnaire about their thoughts and feelings.

For example, exercises aimed at overcoming grievances and those exercises in which each of them received approval and respect had biggest impact on the course of the lesson, according to one of the participants. Among the factors that prevented the work, they called shyness, uncertainty and the usual fear of being worse than others are.

Almost all participants admitted that they learned a lot about themselves, that they are not so "boring", and that they, it turns out, are similar in their experiences to each other and this should not be shy.

In addition, the elderly admitted that they learned a lot about others and that they will certainly continue acquaintance after classes.

Because of the work in the group, some part (about 60 %) expressed a desire to change some attitudes and continue to exercise their skills with those with whom they would like to communicate in the future.

However, it should be noted that about 30 – 40% of the elderly mostly with severe rigidity were simply present and did not take much part in the development of skills. After each session, they were also given individual consultations. However, both participants and medical and service personnel noted that it was rather difficult to interact with them, that they are constantly *straining* with their discontent, complaints and thirst for constant attention.

Upon completion of training the repeated diagnostics of the anxiety level of all older people was carried out. As it can be seen from table 2, 53.3% of participants with a high level of anxiety had a decrease to a moderate level. Among 40% - moderate anxiety dropped to a more moderate. This, though not very significant, but the result. 13.3 % still have high anxiety-these are participants with a high level of rigidity and old enough age, although some participants of the same age had positive changes. Perhaps the absence of positive changes was influenced by the character features, but this factor is in this study, we have not taken into account. After the experiment, measurements were made in the control group of the elderly. The results of the repeated diagnosis of the level of anxiety in the elderly control group are given in the Table 2. After a training workshop with staff, a small proportion of 6.6% of the elderly with average level of anxiety in the control group had a low level of anxiety. 33.3 - elderly kept high level. Nevertheless, the 20% with low level increased it to a moderate level.

Table 2. Comparative values of anxiety levels in groups before and after the experiment

Groups	High		Average		Low	
	before	after	before	after	before	after
The experimental group	53,3 %	13,3 %	46,7 %	73,3 %	-	13,4 %
Control group	40 %	40 %	33,4 %	46,6 %	26,6 %	20 %

The table shows that in the experimental group there were significant positive changes compared to the control group.

For example, in the experimental group, 53.3% of the participants had a high level of anxiety, and after the rehabilitation activities, only 13.3% of the participants had a high level.

The high level remained among those participants who had a high level of rigidity in the primary diagnosis, in addition, they were elderly old enough (74 and 75 years), when personal changes and changes in relationships became quite difficult. In the experimental group, in addition, the number of elderly with an average level of anxiety increased, the average level was among 46.6%, and became among73.3 percentage.

If before the experiment in this group no one had low level, now the low level was revealed in 13, 4% of the elderly.

In the control group, the high level remained in 40% of the elderly, slightly increased the number of elderly with an average level – and it was 33.3%, and became 46.6%, and slightly decreased the number with a high level of anxiety, it was 26, 6%, and became 20% likely after General preventive conversations with the elderly, individual counseling and seminars with staff. However, changes in anxiety rates in the experimental group after rehabilitation work were more significant than possible situational changes in the control group.

The effectiveness of social and psychological rehabilitation work with the use of the training program and its appropriateness can be judged by the fact that the elderly began to seek advice from a social psychologist, became friendlier with the members of the group in which they were rehabilitated, became more friendly and patient.

The calculations were carried out using the computer program SPSS-12. The results of our calculations are presented in table 3.

Table 3. Results of comparison of the studied factors in the control group

Factors	Empirical value of criterion U	Significance level	Sum of ranks in *the first measurement*	The sum of ranks in *the second measurement*	The conclusion that there are significant differences
mental state					
Anxiety	102,5	0,674	242,5	222,5	No
Frustration	111,0	0,949	231	234	No
Aggression	105,0	0,746	225	240	No
Rigidity	111,5	0,965	233,5	231,5	No
Stress resistance	107,5	0,835	237,5	227,5	No

Based on the calculations, we can draw the following conclusions:

There was no significant difference between the indicators of anxiety, frustration, and aggressiveness, stress resistance in the control group *before* and *after* corrective action.

Discussions

Old age is called the age of *social loss*. What social changes are taking place at this age?

For many people, retirement is accompanied by a decrease in social activity, reduction of certain roles and material losses. It is especially difficult for those pensioners who have never found satisfaction in anything other than work - neither in Hobbies, nor in reading, nor in obtaining additional education, nor in participating in any organizations. Experts believe that retiring elderly people do not necessarily have to stop working. If the state of health allows, pensioners are quite capable of working on an individual part-time schedule (Stefanishin, 2001; Tashcheyeva, 1993; Firsov & Studenova, 2000; Torinston, 1999; Stuart-Hamilton, 2002; Singh et al., 2018; Satir, 2000).

People, men and women approaching old age, can be divided into the following groups:

1. Those who really want to retire to do something else. They are actively preparing for this, get an additional specialty or just learn new, necessary information. Pension is perceived as the beginning of a new life, when you can do what you love with full return.

2. Those who are very afraid of retirement. By any means try to extend the time of work, feel useless if they cannot earn enough, from their point of view, the amount of money.

3. The third group of people can be called indifferent, they do not work with full efficiency for a long time, and retirement does not bring them significant experiences associated with the need to redistribute vital energy. They continue their existence, long ago and habitually painted with all shades of depersonalization to a full life (Dmitriev, 1980). However, for an elderly person not less than retirement, the problem of changing the status due to the change of relations with family and friends is important. As in any other period of life, a person's role and responsibilities, as well as his or her satisfaction with life, are defined in the social context of his or her family and personal relationships.

At the later stages of ontogenesis, as M.D. Alexandrova (1974) notes, there are new trends in relations with spouses, children and grandchildren. Older people continue to feel obliged to help children when needed (from monetary support and supervision of grandchildren to advice). Grandchildren are often one of the greatest joys of this period. The roles of grandparents give a sense of personal and family renewal, bring diversity to life and at the same time are signs of longevity. Some grandparents feel a special importance of their role in maintaining the stability and moral standards in the period of the split in the family. It is stated that for the majority of elderly people the satisfaction with marriage increases after their grown-up children begin to live separately. Although, of course, initially and may arise some difficulties, because, when neither children nor work distract, people need to re-learn to live together (Alexandrova, 1974). However, most couples who have raised children and survived marriage experience less stress and a stronger sense of satisfaction and harmony. In addition, pairs that show a high level of satisfaction with the marriage often say that marriage began to occupy a more important place in their emotional life. Marriage becomes a true source of comfort, support and intimacy for them. Happy marriages, preserved in old age, often become the basis of mutual support, help and love. However, the death of a married spouse leads to the acquisition of a new status and a new role - widow or widower.

For many, according to research A.I. Tashcheyeva (1993), it is a very difficult transition associated with a real lifestyle change and risk to be isolated from others. Women are almost three times more likely to be widowed than men are, and therefore older men are married and older women are unmarried. By the age of about 85, four out of five women become widows. In addition, this imbalance is expressed not only in quantity but also in time. On average, elderly widows live 50% longer after the death of their spouse than widowers of the same age (Tashcheyeva, 1993; Satina, 2001). According To L.V. Satina's (2001) research, widows and widowers living alone often face practical and psychological difficulties. They are forced to solve domestic problems, maintain social contacts and make financial decisions. Widows possibly are better able to maintain social contacts because the very wives, according to tradition, maintain contact with family members and meeting with friends usually occur on their initiative. Widowers are therefore more likely to be isolated, losing the social contacts that the couple had. Theoretical analysis of the problems of the elderly, the problems and features of the provision of professional assistance allows us to draw the following conclusions:

The organization of assistance to the elderly should be based on the fact that the elderly — an adult, Mature, wise experience, able to learn new experiences. This approach is fundamentally different from treating older persons as damaged objects in need of rehabilitation or as innocent victims of the negative effects of an oppressive social system.

It should be believed that an elderly person has the ability to learn new experiences.

It is necessary to have or develop in social workers certain important psychological qualities for successful performance of work: the presence of positive motivation to work, friendly attitude to people, communication skills, empathy, neuro-psychic and emotional stability, patience.

It is necessary to develop the necessary psychological qualities of social workers in special classes, courses and trainings, business games, to develop self-control and reflexive skills to optimize their professional activities.

In working with the elderly, it is necessary to prevent professional burnout or psychosomatic diseases caused by emotionally stressful work, to develop a service of psychological support for social workers to optimize professional activity.

Conclusion

Understanding the psychological problems of the elderly in modern times, allowed to formulate the theme of the study. The aim of the study was to theoretically substantiate the necessity and possibility of rehabilitation work with the elderly in the conditions of their stay in the *nursing Home.*

In the course of solving the problems of the study, the factors of the unfavorable psychological state of the elderly in the *nursing Home* were identified. Based on a comprehensive analysis of the results of diagnosis and factors of adverse mental States, the program was justified and rehabilitation work was carried out with the elderly, who revealed anxiety of medium and high level.

Repeated diagnostics of mental States of elderly control and experimental groups allowed to be convinced of possibility and expediency of carrying out with elderly of rehabilitation work with application of the training program and psychological consultation.

Our experiment made it possible to make sure that such work is necessary and can positively influence the mood, more confident behavior, well-being of the elderly who are in the *nursing Home* under certain conditions:

a) Diagnostics of individual personal characteristics and psychological States of elderly people in the *nursing Home* with the help of selected diagnostic tools;

b) According to the individual characteristics of the elderly, the development of a program for their adaptation to the conditions of the *nursing Home*, which includes consulting work with staff to improve their socio - pedagogical, psychological and professional competence.

Abstract

The relevance of the study is due to the trends in the transformation of the University educational process, the key idea of which is the structuring, organization and presentation to the international student of constantly expanding amount of knowledge in terms of budget standards of academic time. The established disproportions determine the need to use non-traditional approaches to the construction of a new reality of the educational process in the University, among which in the synthesis of knowledge elements' integrated system, the transformation of educational information in the content of training, the transformation of verbal information into non-verbal, the creation of innovative symbolic structural schemes of its presentation to international students the importance and universality of frame pedagogical technologies is proved. In this regard, the article reveals the features of the frame approach to the organization and presentation of knowledge's modern picture of an international student in the educational process of the University. The universal format of consolidation of knowledge didactic units in the design of frame technologies is established. Based on the results of the study, the priority of technologies - concepts and technologies - scripts of the organization and presentation of knowledge's modern picture of an international student is justified and the effectiveness of their implementation in the educational process of the University is proved.

Keywords: frame, frame technology, educational process of the University, the identity of the international student, organization and presentation of knowledge's modern picture, the new reality of the educational process, the format of frame-based technologies, technology – concepts, technology – scripts,pedagogical observation

Introduction

1.1. The Relevance of the Study

The beginning of the XX1 century is determined by the formation of a new picture of the world - four – dimensional space - time, allowing considering reality as a relative value (Bateson, 2005; Vakhstein, 2011; Hoffman, 2004). In physics, scientists are increasingly moving away from the study of the visible world, go beyond the upper atmosphere, study the organization of near-earth space and develop nanotechnology. Bold hypotheses are realized in human space flights, achievements of robotics, attempts to create artificial intelligence. The computer industry is developing rapidly, which affects not only further scientific progress, but also the structure and organization of society. At the same time, in the development of scientific thought there are many interdisciplinary connections and boundary Sciences, resulting in special methods and concepts inherent in the earlier one scientific field, penetrate into another and acquire a different meaning. This process of borrowing is largely due to the fact that the meanings of new categories and methods of various fields of modern science do not yet have a clear definition and can describe different subjects of study (Gladush, Trofimova & Fillipov, 2008; Kolesnik, 2002; Makarov, 2003; Nekrasov & Molchanova, 2009; Ardakani et al, 2015). It is established that at the beginning of the new Millennium in modern science increasingly important are the theories, the semantic essence of which is the structuring of the system of knowledge from different fields of science (Batygin, 2003; Bateson, 2005; Vakhstein, 2011; Drozhzhina, 2013; Douady, 1997; Nekrasov & Molchanova, 2009; Tastan et al., 2018). In these conditions, the boundaries of traditional concepts and theories of University student training are also transformed. New science and the industrial areas need specialists of a new generation, the quality of which match the most advanced technology. Priorities are increasingly inclined to frame approach in the transformation of training content, characterized by practical orientation of understanding the knowledge's modern picture and improving the effectiveness of new structural schemes of their presentation to the student (Bateson, 2005; Hoffmann, 2004; Guselnikova, 2009; Morenko, 2018; Nekrasov & Molchanova, 2009; Sukhonosova, 2012; Vinogradova et al., 2018; Hashim et al, 2018; Semin & Kurdymov, 2018). These trends are consistent with the search for effective solutions in transforming the content of training international students in modern University and substantiate the significance of frame technology, constructing a new reality of the educational process at the expense of enlargement of didactic units (Itinson & Rubtsova, 2015; Kolodochka, 2004; Lozinskaya, 2009; Sukhonosova, 2012; Bicer et al., 2018). It is established, enlargement of didactic units in the learning process of an international student is provided by a complex of pedagogical conditions, due to the content of information, its intellectual capacity, interdisciplinary nature, creating a new educational environment for the implementation of frame-based technologies of organization and presentation of knowledge's modern picture of international students (Hoffman, 2004; Ivanova, 2001; Lozinskaya, 2009; Petrov, 2009; Fedorova, 2008; Erdniev, 1992). In this regard, the main attention in this article is given to the development of theoretical and methodical approach to the design of the learning process of an international student based on frame technologies of organization and presentation of a modern picture of knowledge to students. The article reveals the features of the frame approach to the organization and presentation of the modern picture of knowledge of an international student in the educational process of the University. The universal format of enlargement of didactic units of knowledge in the design of frame technologies is established. Based on the results of the study, the priority of technologies - concepts and technologies - scripts of organization and presentation of knowledge's modern picture of an international student is justified and the effectiveness of their implementation in the educational process of the University is proved.

Literature Review

The methodological basis of this study is a set of concepts of G. Bateson (1972), I. Hoffmann (1974), M. Minskiy (1979), developing in the framework of philosophy, sociology, psychology, cognitive linguistics, Cybernetics, self-organizing around the problem of information, on the basis of which a person makes predictions and correlates them with his/her behavior. The semantic content of the frame in this article is used as a *collective designation of context* (Vakhstein, 2011; Hoffman, 2004; Guselnikova, 2009). The study examined the work of leading philosophers, sociologists, psychologists, experts in linguistics, teachers and educationists on various aspects of the problem of frame (Bateson, 2005; Vakhshtein, 2011; Hoffmann, 2004; Gurina & Sokolova, 2005; Douady, 1997; Kolesnik, 2002; Kolodochka, 2004; Lozinskaya, 2009; Makarov, 2003; Medvedenko, 2017; Minskiy, 1979; Sukhonosova, 2012; Fedorova, 2008; Erdniev, 1992). Scientific and methodical ideas and conclusions of these authors in this study are used as a basis for the development of frame technologies of organization and presentation of knowledge's modern picture of an international student in the educational process of the University. It is established, the use of frame-based technologies in the educational process of international students by many authors is considered as one of effective approaches to teaching professional, natural - scientific and socio - humanitarian disciplines through the enlargement of knowledge's elements, generalization of imaginative and logical knowledge, algorithmization of a universal structure of the schemes – supports in iconic – symbolic form (Gurina & Sokolova, 2005; Drozhzhina, 2013; Ivanova, 2001; Itinson & Rubtsova, 2015; Lozinskaya, 2009; Medvedenko, 2017; Petrov, 2009; Fedorova, 2008). Pedagogical research in recent years presents a classification of frames, justifies the theoretical and practical feasibility of the design and implementation of frame technology as an innovative element of the University educational process, highlights the advantages, identifies the requirements for creating (Gurina & Sokolova, 2005; Kolesnik, 2002; Lozinskaya, 2009; Morenko, 2018; Fedorova, 2008). At the same time, some chaotic character is established, which is present in the use of conceptual apparatus, structure and subject content of frame technologies in the training of an international student (Guselnikova, 2009; Kolodochka, 2004; Makarov, 2003; Medvedenko, 2017; Fedorova, 2008). In the course of this study, an attempt was made to classify frame technologies structured based on pedagogical goals of transforming the content of education through the enlargement of didactic units. It is established that the process of enlargement of didactic units creates the necessary educational environment for the productivity of the frame in the organization and presentation of knowledge's modern picture of an international student, as the studied material can be expressed in tables, diagrams, slides, which significantly saves time and provides the student the opportunity on the basis of independent study of the material to form their own solution to the problems encountered in the learning process. Some authors (Gurina & Sokolova, 2005; Fedorova, 2008) correlate the frame technologies with the instruction of formation of the approximate basis of personality actions, although they recognize the originality and importance of using the specific features inherent in frame technology: structure, awareness, stereotype, visualization, repeatability, the presence of frame form, associativity of connections, etc. Despite the extensive bibliography devoted to the study of the research problem, aspects of the theoretical and methodical approach to the construction of a new educational environment in the educational process of the University on the basis of frame technologies of organization and presentation of knowledge's modern picture of an international student, need for a more extended, scientifically based study.

Results

3.1. Pedagogical Essence of Frame Approach to Organization and Presentation of Knowledge's Modern Picture of International Student

The study found that the frame theory in the pedagogical process of the University is used since the 70s of the twentieth century. In educational process of international students in the development of an expanded interpretation of the semantic content of the notion *frame* a significant contribution is made by V.S. Vakhshtein (2011), R.V. Gurina and E.E. Sokolova (2005), T.N. Kolodochka (2004), M. Makarov (2003), S.V. Sukhonosova (2012). These authors investigated the possibility of the frame in the problem, modular, project, concentrated training of international students as a technological mechanism for rethinking the structure and content of educational information. In the most General form, the frame in their works is defined as a unit of knowledge organized around a certain concept, and as a way of organizing an international student's ideas about the modern picture of knowledge stored in memory. The authors identify it with such concepts as scheme, associative connections, semantic field in cognitive linguistics, and use it as a General generic designation of scenario discourse, script, and cognitive model in pedagogy. General information about the frame technologies of knowledge formation in the training of international students are presented by periodically repeated ways of organizing educational material (frame as a concept) and educational time (frame as a script) for disciplines, the theoretical material of which is subjected to *compaction* and has a frame structure (Makarov, 2003). Despite differences in the specific areas of knowledge, all the authors use frame-based approach to teaching international students share common goals, identical mechanisms for the implementation of frame-based approach, describe the identical factors that necessitate the use of frames in training and therefore have the same student learning outcomes using frames (Domorovskaya, 2007; Drozhzhina, 2013; Ivanova, 2001). It is established that the traditional lecture-seminar system of higher education is having trouble due to modern educational transformations, including the dynamics of the growth of new subjects, the increase in the volume of knowledge, as well as the dominance of new forms of training based on Internet resources. Therefore, one of the ways to solve real problems in the training of international students is the implementation of modern pedagogical technologies that allow to expand the amount of assimilated knowledge without increasing the amount of time allocated to their study, as well as to integrate learning objectives with individual creative abilities of the individual and with the educational resources of the University (Makarov, 2003). It is proved, from the point of view of training technique frames have the requisite productivity because the learning material is quickly transformed into tables, charts, slides, which helps to save training time for international student and extend the capabilities of self-organization of knowledge's modern view and forming their own solutions to problems. The study found that the frame approach in the organization and presentation of knowledge's modern picture of an international student, due to the properties of the frame (the categorical principle of knowledge organization, the representation of knowledge about the typified situation, well-structured hierarchical structure, the presence of the conventional beginning and prospects of development) provides many advantages in the design of the content of training focused on the deepening and stability of the basic knowledge of the student of actual, perspective and reflexive value. In addition, the conventional beginning of the frame turn it into a pedagogical mechanism that extends the memory and attention of an international student, the speed of perception and memorization of information, contribute to the development of system thinking, design competencies and implementation of a variety of intellectual operations, the construction of clear and competent structural and logical schemes that expand operational, tactical and reflexive perception of the modern picture of knowledge. The frame concretizes and confirms the specificity and typicality of certain episodes of educational, cognitive, social and personal interaction (lecture activities, participation in seminars, laboratory work, independent, research forms, leisure communication and other educational activities). Frames organize understanding of the world as a whole by the international student, form ordinary behavior through representation of a stereotypical situation (behavior in an audience, algorithm of lecture, laboratory, independent or research work). The study proves that each frame determines specific behaviors of an international student in learning activities for the assimilation of information: 1) the use of information; 2) the expectation of consequences after use; 3) the problem-based situation, if the expectations are not confirmed (Gladush, Trofimova & Fillipov, 2008). It is proved that such an algorithm of assimilation of information by an international student is a frame format of training, involving a nonlinear organization of the educational process, characteristic of multi-level education, implementing a research approach to learning by action (Lozinskaya, 2009). It is established that the frame approach also provides the orientation of the student to perform a full, closed cycle of productive activity - from the idea, image, to implementation and reflection. To achieve this goal, it is necessary to solve a number of tasks related to the implementation of certain stages of educational activity, first with the help of a teacher, which gradually shifts towards counseling, and then – to the full independent productive activity of an international student. The efficiency of three parallel lines of frame approach to the organization and presentation of knowledge's modern picture of an international student is established:

- The first line-the solution of traditional educational tasks as mini-frames of educational activities corresponding to situational activity;
- the second line-the solution of educational problems of the second level - tactical, appropriate supra-situational activity - larger training frames, where students can formulate the goals of their activities, actively apply knowledge in various areas in practice, interact with each other, etc. At this level, value-oriented, transformative, communicative, emotional and visual components enhance the educational process. The implementation of these components is achieved by using of oral and written reports, messages, the use of business games, game modeling, interdisciplinary, research projects, etc. in the process of organization and presentation of knowledge's modern picture in the educational process;
- The third line is the solution of educational tasks of the third level, corresponding to the creative activity of the student, strategic educational tasks of large educational frames. These frames can be implemented in practical training and educational design through organization of the student's own experience in the implementation of integrative educational and professional activities.

During the research the importance of frame approach is established: 1) for the learning process and for the process of solving real problems of international students through active participation in their formulation, design, implementation and discussion of the solutions; 2) for the student's acquisition of valuable experience with various databases, involving the formation of skills to choose and make decisions based on specific situations; 3) For the student's acquisition of critical thinking experience, skills of responsibility for their own choice of solutions. In the whole, in the aggregate of the established directions, the implementation of the frame-based approach to the organization and presentation of knowledge's modern pictures of international students allows to solve the important task of the educational process – the connection of knowledge with the ability to use it in real educational and life situations.

3.2. Universal Format of Enlargement of Knowledge's Didactic Units in the Design of Frame Technologies

The modern picture of knowledge, due to the dominance of the organizational and methodical level of the set of basic invariant courses, variable and elective disciplines, all kinds of practices, and on the content level - the presence of large information units, structures and complex imagery material, complicating their assimilation by an international student in the educational process of the University, is characterized by radical transformations. The key idea of these transformations in the process of acceptance and understanding of educational information by a person is the enlargement of didactic units. The phenomenon of didactic units' enlargement by leading experts is considered as a universal format of processing of educational and scientific information, as an extended and multilateral generality and structure, characteristic of the whole process of cognition, human thinking, memory (Bateson, 2005; Batygin, 2003; Vakhstein, 2011; Hoffman, 2004; Guselnikova, 2009; Sova, 1984). The task of enlargement of didactic units in the learning process of an international student by many authors is related to the task of understanding and highlighting by the personality of the meaning of the text (Gurina & Skolova, 2005; Domorovskaya, 2007; Douady, 1997; Itinson & Rubtsova, 2015) In pedagogical science, two semantic structures of the text are considered to be generally recognized: structure № 1 is the meaning that is laid down in the text, structure № 2 is the meaning that the student comprehended in the process of understanding (interpretation) of the text. The complexity of the process of understanding (interpretation) of the text lies in the fundamental impossibility of coincidence of knowledge forming the structure № 1 and structure № 2. Since the structure № 1 is formed due to the totality of ideas, needs, interests, experience of the authors of information, respectively, the structure № 2 is formed in the process of understanding (interpretation) of the text by attracting the totality of educational, scientific and personal potential of the student.

The Central point in the process of adoption of the text is the formation of semantic structure: the allocation of key words or semantic milestones, as well as the Union of semantic milestones in a single knowledge structure. In the text, as a rule, there are two types of connections: explicit (visible) and implicit (hidden). Explicit links divide the text into sections, chapters, paragraphs, highlight keywords, laws, formulas, principles, categories. Implicit cause major difficulties in understanding. They are based on content-based connections of information of actual, retrospective, perspective and reflexive character, on competences of the student to understand all text entirely and to be able to allocate the main values of information. The process of acceptance of the text by the student is influenced by his personal experience, General scientific erudition, and background knowledge. The procedure of splitting the text into parts, then compacting into a semantic milestone, is the basis for any individual process of adopting the text. A set of keywords is a set of reference points on which the text is deployed when encoded in memory and is realized during decoding as the information core of the system. It is proved that this approach to the enlargement of knowledge's didactic units of an international student accurately reflects his process of thinking by determining the basic unit of information and a closer connection of knowledge based on facts, procedural mechanisms due to the content of information, its intellectual capacity, and interdisciplinary nature. In addition, the enlargement of didactic units in the learning process of an international student is provided by a set of pedagogical conditions, among which priorities are given to:

- Systematization – which is effective in text, tabular, hierarchical, symbolic forms of educational information. It is focused on the structuring of educational content, the transformation of verbal information into nonverbal (figurative), the use of significant and stereotypical links between the elements of knowledge, the synthesis of an integrated system of knowledge elements;
- Generalization – which is effective in tabular, graphic, databases, hierarchical, telecommunication forms of educational information. It is focused on the development of figurative and logical thinking based on the use of structural schemes of information presentation, supporting abstracts, units - schemes of information, logical-semantic matrices;
- The occurrence frequency of ways of organizing the teaching content and teaching time for subjects, theoretical material of which undergoes enlargement;
- Algorithmization – which is priority in the use of concise, capacious, universal rules-regulations of educational actions and their sequence in the process of solving educational problems of a certain class:

immersion in the problem-formulation of the problem-setting goals and objectives-organization of work groups-phased distribution of the content of the frames (indicating intermediate results) - determining the role of each participant in the group - planning of joint and individual activities - discussion of research methods - a discussion of the outcomes' design (presentation, role play, video, report, etc.) summarizing, and presentation of results, presentation – insights - introducing new problems (Hoffmann, 2004; Ivanova, 2001; Lozinskaya, 2009; Petrov, 2009; Fedorova, 2008; Erdniev, 1992).

3.3. Priorities of Frame Technologies of Organization and Presentation Knowledge's Modern Picture of an International Student

In the course of the study, the discourse of framing pedagogical technologies of organization and presentation of knowledge's modern picture of an international student in the educational process of the University is substantiated as a periodically repeated way of organizing educational material (frame concept) and educational time (frame script) for disciplines whose theoretical material is subjected to compaction (Sukhonosova, 2012; Fedorova, 2008; Erdniev, 1992). The established technologies allow an international student to expand the volume of acquired knowledge and information without increasing the amount of time to study them, as well as to bring learning goals closer to individual creative possibilities. Frame technology priorities of the organization and representing the knowledge's modern picture of an international student are proven – oriented on the organization of the educational material - frame technology - concept and organization of learning time –frame technology – script.

1. Structure and content of frame – concept technology. It is a *window* (similar to a computer), which is loaded with certain educational information, focused on specific goals. Four pedagogical rules that must be followed in the design and implementation of the frame concept technology:

- updating of knowledge - information is loaded in the *window* in the form of concepts, formulas, short definitions, values corresponding to the didactic problems of the previous material;

- Specification of cause-and-effect relations between the previous, already studied material and the new, forthcoming for study;

- Visual placement of drawings, diagrams and other symbolic texts that complement the content of the information;

- Design of reference abstract of the studied content:

1) formulation of goals, objectives;

2) Structuring the requirements for the content of the basic abstract;

3) The definition of the format of information (performed in a variety, depending on the creativity of the teacher, forms);

4) Definition of functions, methods and means of implementation of the basic abstract in training;

5) Design of the content part (basic knowledge, structured in a logical sequence and presented in the form of visual graphical tools, symbolic texts);

6) Definition of the logical-semantic scheme of the basic abstract. It performs the function of a framework for the content of information that establishes the most typical, significant, system-forming relationships between the semantic cells of educational information:

- Units- diagrams representing the whole structure of educational information. Based on the general structural elements of theoretical knowledge's content, it is possible to build a frame unit-diagram consisting of cells: the field of theoretical knowledge (topic, section) and elements of knowledge (scientific facts, concepts, laws, theories). The selected structure can be refined and supplemented with the introduction of other cells that establish system relationships that reveal the meanings of the scheme elements;

- Logical and semantic matrices, with which the systematization of knowledge, the development of analytical and diagnostic skills of students in the structuring of educational content is fulfilled. Linear and multidimensional matrices are defined: linear matrices – enlarged educational knowledge, allocated on a certain basis, are arranged in order along one axis. An example of a frame-linear matrix is the time axis, which marked the stages of development of scientific knowledge in a particular area. Multidimensional matrices are constructed in the form of tables based on the comparison or generalization of structural elements of knowledge (for example, regularities-prerequisites-cause-effect);

- supporting - connecting schemes. The high level of efficiency of supporting - connecting schemes' use in the process of students' presenting with the basic structural elements of information is proved. For this purpose, in the center of the scheme there is a generalized concept corresponding to the topic, the section of the discipline from which the rays of the structural elements of knowledge radiate (scientific facts, concepts, laws and theories). On each ray, the components of the knowledge elements necessary for the study are placed with the help of nodes;

2. Structure and content of the frame – script technology. It is based on the sequence of execution or correction of educational actions and analysis of the educational situation. The hierarchical structure of the frame script consists of information terminals (slot nodes) and non-terminal nodes. The terminal presents and describes the subject under study, its specific features, as well as information about the relationship with other subjects, about the way the frame is used, about the next action or about the action to be performed if the assumption is not justified. Nonterminal nodes contain additional information and information related to the object that describes the frame, as well as data required for exit procedures. To explain the student's rapid understanding of the situation, it is necessary to correlate the frame script terminals with the most typical questions caused by this situation. The frame script (often is identified with the frame scenario) is the procedure for performing the task, action: description of algorithmic requirements using the established language of information transmission (description of the sequence of the problem solving, the instruction of actions in the case of negative results, advice on solving certain problems), is a unit of questions about the topic under study, the problem, the expected situation, solutions and answers to them. In the course of the research the structure and content of frames – scripts technologies, the most adapted to the content of the international student's education, are substantiated:

- frame algorithm technology. They form and develop educational skills of assimilation and systematization of knowledge on discipline. Work on a given algorithm requires students to perform a variety of intelligent operations and update information from other frames;

- frame-description technology. It reveals the regularities of events or processes, the characteristic features of which are the high generality of the structure of the text and the sequence of development of the situation or cause – effect relationship of the basic content of the text. Technology-description is presented in sign-symbolic or graphical form with the help of digital, algorithmic, symbolic logograms;

- problem-solving frame technology. The study identified the stereotypical, didactic elements of the technology of the problem-solving frame: problem actualization - formation of knowledge about the ways to solve the problem – the choice of the problem solution – the problem solution – the assessment of the optimality of the decision. The main purpose of this type of technology - the development of logical, problem-based, creative thinking of an international student.

Conclusion

The study confirms the theoretical and practical significance of the problem of design and implementation of frame –based pedagogical technologies as an actual practice-oriented direction of transformation of the educational process of the University, the key idea of which is the organization and presentation of knowledge's modern picture to an international student, determined by the synthesis of an integrated system of its elements, the transformation of educational information in the content of training, the transformation of verbal information into non-verbal, the use of innovative sign-symbolic structural representation schemes. Based on the results of the study, the universality of didactic units' enlargement of educational and scientific information in the organization and presentation of knowledge's modern picture of an international student in the implementation of basic frame technologies (technology – concepts, technology - scripts) is proved. This trend is provided by a set of pedagogical conditions, among which priorities are given to: systematization, generalization, repeatability of methods of organizing the content of training and educational time, algorithmization. It is proved that in the course of didactic units' enlargement in the content of training there is a *materialization* of educational information in concise, succinct, substantial texts; verbal information is transformed into imaginative (non-verbal); a complete system of knowledge and abstract thoughts of students is formed: their theoretical knowledge is systematized, deepened, expanded, their subconscious abilities of creative initiative, independent creative thinking are developed, practical competence for information management in educational activities are formed. In this regard, this article theoretically justified and experimentally confirmed the effectiveness of theoretical and methodical approach to the design of the learning process of an international student based on frame technologies of organization and presentation of the modern picture of knowledge. The article reveals the features of the frame approach to the organization and presentation of knowledge's modern picture of an international student in the educational process of the University. The universal format of enlargement of knowledge's didactic units in the design of frame technologies is established. Based on the results of the study, the priority of concepts - technologies and scripts - technologies of the organization and presentation of knowledge's modern picture of an international student is justified and the effectiveness of their implementation in the educational process of the University is proved.

The study of didactic resources of frame technologies is not completed by solving the problems of the study. The frame approach to the integration of network technologies with educational technologies of the University is of particular interest to future researchers.

Abstract

The paper describes language aspects of verbalizing emotions in the texts of the Russian online mass media on economy and finance. Some statistical data obtained from the comprehensive analysis of the words that name and describe emotions in the Russian articles are given and studied. The emotive vocabulary was broken down into groups following the authors' classification. The authors focus on syntagmatic relations and functions of the names of emotions, as well as on their correlation with economic and financial terms.

Keywords: verbalization of emotions, language representation of emotions,emotive lexis, names of emotions,
Russian economic mass media.

Introduction

Contemporary linguistics of emotions sees the next stage of development: new blended research areas emerge that study the issue of emotions from different perspectives. Hence, a new research discipline within anthropocentric linguistics, i.e. linguistic ecology, has been created. V.I. Shakhovsky(2016), a famous Russian scholar, states that this discipline focuses on emotional aspect of speech. He also describes emotional linguistic ecology as a science studying "health safety of a language, language environment of a person being the part of nature".

The language of emotions in mass media on economy and finance plays a truly significant role due to trends in modern intercultural communication. Globalization and integration processes open new opportunities, types and forms of communication, the existence of which is impossible without mutual understanding between different cultures (Birova, Vasbieva & Masalimova, 2017). Contemporary economic mass media is widely used for educational purposes to master students' professional communicative competence, socio-cultural and intercultural skills, developing creative thinking (Kalugina, 2016; Vasbieva & Kalugina, 2016; Novikova et al., 2018; Kulamikhina et al., 2018; Kalugina & Tarasevich, 2018; Khorrami et al, 2015; Zulkifli, & binti Ali, 2017; Chernopyatov, 2018; Adedeji, 2018). Students have difficulty mastering lexical units that form the lexical side of foreign speech and are characterized by a particular semantic and structural properties (Vasbieva, 2015, 2016). In such terms, linguistics needs a comprehensive analysis of emotive lexis used in this context. No previous study has thoroughly investigated verbalization of emotions in the texts of Russian economic and financial online mass media.

The main purpose of this study is to perform an analysis of the names of emotions in Russian economic and financial mass media following the concept classification developed by the authors. To achieve this purpose, we set several objectives:

– to present contemporary literature review on the issue
– to make up an alphabet and frequency word list of the names of emotions, which were identified in the texts under investigation
– to distinguish these names of emotions according to the classification developed by the authors
– to study structural and semantic properties of the words within the clusters of the classification.

Literature Review

V.I. Shakhovsky (2016) names two approaches to language study in terms of linguistic ecology: its interaction with the user, and with other languages. In the more recent paper, the scholar addresses the problems of the language personality theory, supports the idea of including an emotional component into the structure of a language personality concept. He also explains the necessity to use the new scientific term – 'emotional and communicative personality'. The researcher highlights the factual communicativeness of any language personality and states that communication is impossible without feelings for the topic, content or selection of linguistic/stylistic devices within the process of communication (Shakhovsky, 2018).

L. Alba-Juez and T. Larina (2018) separate the terms *emotional* and *emotive communication*. The scholars believe that the first type stands for "instinctive, spontaneous, unplanned expression of inner emotional states", whether emotive communication is considered as "intentional expression of emotions for communicative purposes".

It is common research practice for linguists to separate such notions, as *feelings*, *emotions*, *affects*, *experiences*. English speaking scholars use the term *emotions* to describe sudden and strong reactions to environment and accompanied by some physiologic changes. *Feelings* are more constant. The most common term, which includes the whole range of *moods*, *emotions*, *feelings*, is the word *affect* (Yus, 2018). Nevertheless, M. Schwarz-Friesel (2015)disagrees with this point of view and suggests that *emotions* should be considered as a complex knowledge system created with inner sensations that performs primarily an evaluation function in a human body. He understands *feelings* as emotions experienced consciously, qualifying them as mental representations.

Stating that communication is impossible without the emotional factor, V.I. Shakhovsky(2018) refers to contemporary intercultural interaction, within which famous officials, politicians and businessmen use aggressive, sharp utterances, expressive language. The scholar's analysis of Russian mass media texts indicated new trends and changes in the language of emotions. Thus, V.I. Shakhovsky (2016) claims that the scale of emotive names has become more asymmetric. He connects this phenomenon to the process of losing applicability and contextual significance of some positive emotional concepts, as well as to their low demand or even total absence of demand in speech.

It is obvious that today scientists focus more on the relationship between emotionality and financial human behavior. Some researchers state that patients suffering from emotional disturbance make more successful decisions on investment than those who suffer from other disorders or even than healthy ones (Shiv,2005). J.L. Mackenzie(2018) studies the usage of nouns *sentiment* and *confidence* in financial English within the texts of the Hong Kong Financial Services Corpus. The results of his research show the negative side of emotionality, for example, in case of irrational human behavior while making decisions at the stock market.

Methodology

This paper investigates 12 articles from Russian websites (*Ведомости / Vedomosti, Коммерсант / Kommersant, Эксперт / Expert*).

The first step was to generate a word list of the names of emotions identified in the articles. The vocabulary items were selected following various conceptual dictionaries with those meanings that were only valuable within the scope of this study. The basic word classes represented in the list are nouns and verbs with modifiers (adjectives and adverbs) derived from them.

1) беспокойство 'worry' *n*
2) бояться 'to fear' *v*
3) виноватый 'guilty' *adj*2
4) возмущение 'indignation' *n*
5) возмущенный 'indignant' *adj*
6) волновать 'to excite' *v*
7) грустно 'sadly' *adv*
8) довольный 'pleased' *adj*
9) любить 'to love' *v*3

10) любоваться ‘to admire’ *v*
11) мучительно ‘agonizingly’ *adv*
12) наслаждаться ‘to enjoy’ *v*
13) настороженно ‘cautiously’ *adv*
14) нелюбимый ‘unloved’ *adj*
15) неприятный ‘unpleasant’ *adj*
16) нравиться ‘to like’ *v*
17) обвинять ‘to blame’ *v*
18) обеспокоенность ‘anxiety’ *n*
19) обидный ‘offensive’ *adj* 2
20) опасаться ‘to be apprehensive’ *v* 2
21) опасение ‘apprehension’ *n*2
22) отчаянно ‘desperately’ *adv*
23) паника ‘panic’ *n*
24) печалиться ‘to sorrow’ *v*
25) позавидовать ‘to envy’ *v*3
26) понравиться ‘to be liked’ *v* 2
27) пострадать ‘to suffer’ *v*4
28) пугать ‘frighten’ *v* 2
29) рад ‘happy’ *adj*
30) разочарование ‘disappointment’ *n*
31) страх ‘fear’ *n*2
32) счастье ‘happiness’ *n*
33) тревожный ‘anxious’ *adj*2
34) удовольствие ‘pleasure’ *n*
35) ужасный ‘horrible’ *adj*
36) чувствовать ‘feel’ *v*2
37) эмоция ‘emotion’ *n*

According to the quantitative analysis of the word list, 37 language items in 53 word usages were identified in the texts of the Russian online economic and financial mass media.

The next step was to distinguish the lexemes according to the word classes (Table 1).

Table 1. Names of emotions according to word classes

Word classes	Number of lexemes	Word usages
Noun	10	12
Verb	14	25
Adjective	9	12
Adverb	4	4

As can be seen from table 1 the verbs dominate quantitatively both in the number of lexemes and in word usages. Adjectives are second top of the list with nouns occupying the third position and adverbs at the bottom. It is also important to note that only 12 linguistic units, i.e. 32 percent, were used more than once. The alphabetical and frequency word list of names of emotions shows that the most frequently used Russian lexeme is the verb *пострадать* ‘to suffer’ (4 word usages – w/u).

Results and Discussion

For the purposes of comprehensive linguistic analysis, it was decided to implement the classification of Russian words naming emotions first introduced in the previous research (Smakhtin, 2012). The names of emotions under investigation were broken down into ten categories:

Table 2. Names of emotions according to classification

I. Affections in General	волновать ‘toexcite’ *v* чувствовать ‘feel’ *v* 2 эмоция ‘emotion’ *n*
II. Various Feelings, Emotional States:	
1. Delight, joy, cheer, contentment, tranquility	наслаждаться ‘to enjoy’ *v* довольный ‘pleased’ *adj* рад ‘happy’ *adj* счастье ‘happiness’ *n* удовольствие ‘pleasure’ *n*
2. Love, tenderness, liking, affection, gratitude	любить ‘to love’ *v* 3 любоваться ‘to admire’ *v* нравиться ‘to like’ *v* понравиться ‘to be liked’ *v* 2
3. Compassion, sympathy	-
4. Suffering, regret, embarrassment, shame	виноватый ‘guilty’ *adj* 2 мучительно ‘agonizingly’ *adv* обвинять ‘to blame’ *v* пострадать ‘to suffer’ *v* 4
5. Fear, anxiety, impatience	беспокойство ‘worry’ *n* бояться ‘tofear’ *v* настороженно ‘cautiously’ *adv* обеспокоенность ‘anxiety’ *n* опасаться ‘to be apprehensive’ *v* 2 опасение ‘apprehension’ *n* 2 паника ‘panic’ *n* пугать ‘frighten’ *v* 2 страх ‘fear’ *n* 2 тревожный ‘anxious’ *adj* 2 ужасный ‘horrible’ *adj*
6. Insult, disappointment, discontent	возмущение ‘indignation’ *n* возмущенный ‘indignant’ *adj* обидный ‘offensive’ *adj* 2 разочарование ‘disappointment’ *n*
7. Despair, grief, sorrow	грустно ‘sadly’ *adv* отчаянно ‘desperately’ *adv* печалиться ‘to sorrow’ *v*
8. Disgust, contempt, envy, dislike	неприятный ‘unpleasant’ *adj* позавидовать ‘to envy’ *v* 3
9. Anger, rage, fury	нелюбимый ‘unloved’ *adj*

The data in the table 2 demonstrates quantitative and qualitative composition of each cluster. We can see that the most verbally represented group of emotions in the Russian articles under investigation is ‘Fear, anxiety, impatience’ (11 lexical units (16 w/u)), which consists of 5 nouns with 7 w/u, 3 verbs with 5 w/u, 2 adjectives (3 w/u), and one adverb used also once. Thus, emotions of fear and anxiety were verbalized through the nouns *беспокойство* ‘worry’, *обеспокоенность* ‘anxiety’, *опасение* ‘apprehension’ (2 w/u), *паника* ‘panic’, and *страх* ‘fear’ (2 w/u).

Беспокойство *охватило финансовые рынки* (Vedomosti, December 20th, 2018).

“…Это предмет моей ***обеспокоенности****, потому что официально мы этого не увидим”, – рассказывает директор Института социального анализа и прогнозирования РАНХиГС* (Kommersant, May 13th, 2017).

"Пока нет признаков сокращения добычи нефти, продолжается рост ***опасений*** *касательно замедления спроса в мире", – объясняет аналитик БКС Кирилл Таченников* (Vedomosti, December 20th, 2018).

Высокие ставки и дорогой доллар уже давят на американскую экономику, к этому добавляются ***опасения*** *инвесторов по поводу замедления экономики в Китае – снижение цены нефти закономерно, заключает он* (Vedomosti, December 20th, 2018).

Что же касается ситуации в США, то, уверен аналитик "Алор Брокер" Алексей Антонов, попытки управлять рынками "в ручном режиме" крайне рискованны: если это не удается, рынки посещает еще более масштабная ***паника****, чем если бы этот звонок Мнучина главам инвестбанков просто не состоялся* (Expert, 2018).

Он (StephenJen, CEO, Eurizon SLJ Capital) *положительно оценивает перспективы фунта, считая его перепроданным из-за* ***страха*** *жесткого Brexit* (Vedomosti, December 20th, 2018).

Инвесторов это ***пугает****, но некоторые считают такие* ***страхи*** *контриндикатором*(Vedomosti, December 20th, 2018).

The study of syntagmatic relations of the nouns from the examples above indicates that worry is compared to some disease – it can grasp financial markets as illnesses grasp people. One of the directors of a Moscow higher education institution feels anxiety due to a complex reason: mortgage dependency of families who use maternity capital for mortgage in most cases and then are unable to pay it off, moreover, this fact is not officially documented still.

It is worth mentioning that the noun *опасение* 'apprehension' was both times used in the same article '*Баррель Brent стал дешевле $55*' (Brent barrel price is less than $55) in the plural form, which is typical for the Russian language as this word is countable in Russian. The reasons for apprehension are global demand deceleration (*замедление спроса в мире*) and economy slowdown in China (*замедление экономики в Китае*). Investors are the ones who experience this emotion.

The word *паника* 'panic' was identified in the article '*Обвал перед Рождеством*' (Crash before Christmas) within a set expression *паника посещает* 'panic visits'. The degree of this emotion can be higher (*более масштабная*) if the US authorities try to manage financial markets 'manually' (в ручном режиме). The journalist personifies financial markets by suggesting that they can experience panic.

The article '*Великобритания и Евросоюз стали готовиться к жесткому Brexit*' (Great Britain and EU are getting ready for hard Brexit) introduces fear of hard Brexit as a hypothetical reason for the pound's probably positive future due to its reselling. The second appearance of the noun *страх* 'fear' is in the plural form in the same article commenting the title, the fears are considered as counter-indicators. In this sentence, we can also see the verb *пугать* 'frighten' from the cluster 'Fear, anxiety, impatience': the idea mentioned in the title of the article frightens investors.

«Всех ***пугают*** *две вещи: рост сланцевой добычи в США и замедление темпов роста потребления нефти в мире», – считает аналитик «Атона» Александр Корнилов* (Vedomosti, December 20th, 2018).

In the example, we can see that the journalist uses the opinion of a financial analyst who generalizes and describes the issue as a global one by implementing the pronoun *всех* 'everyone' in the plural form. Everyone is afraid of two things, i.e. fracking growth in the USA and decrease of oil consumption in the world, which are interconnected.

Earlier, the author of this article refers to another analyst who tries to follow the main cause-and-effect relationship between the oil price fall and traders' fears. Trade wars (*торговые войны*) and interest rate increase (*рост процентных ставок*) leading to economy slowdown (замедление экономики) are the factors that cause fear.

Нефть падает главным образом потому, что спекулянты ***боятся*** *замедления мировой экономики – из-за торговых войн и роста процентных ставок, считает аналитик Raiffeisenbank Андрей Полищук* (Vedomosti, December 20th, 2018).

Quoting an ING analyst, the author of the article '*Великобритания и Евросоюз стали готовиться к жесткому Brexit*' (Great Britain and EU are getting ready for hard Brexit) predicts hard times for retail due to consumers' fears for their jobs in case Brexit happens without agreeing with the EU. We should pay attention to the fact that the verb form identified in the sentence *опасаясь* 'being apprehensive' is a so-called transgressive verb form typical for Russian. The same author uses such a verb form of this word in another sentence within the article describing the opinion of some Brexit supporters with the help of the allusion to La La Land. The EU is compared to human beings with the feeling of apprehension; the main reason is some hypothetical problems caused by Brexit.

Рождественский период будет непростым для розницы: потребители уже осторожничают, а могут занервничать еще больше, ***опасаясь*** *за свои рабочие места в случае Brexit без договоренности с ЕС, пишет аналитик ING Джеймс Смит* (Vedomosti, December 20th, 2018).

По словам европейских дипломатов (их мнения приводит Financial Times), некоторые сторонники Brexit по-прежнему «живут в «Ла-ла Ленде», полагая, что ЕС, ***опасаясь*** *проблем, пойдет Британии навстречу в спорных вопросах* (Vedomosti, December 20th, 2018).

The analysis of syntagmatic relations of the adjectives of this group of emotions shows us that in the Russian linguistic worldview an image or a situation may be described as anxious (*тревожный*), while results are horrible (*ужасный*).

Картина очень ***тревожная****. Мы надеемся, что системообразующие компании с трудом, но переживут новый год, громких падений быть не должно» – говорит заместитель исполнительного директора Ассоциации эксплуатантов воздушного транспорта (АЭВТ) Борис Шокуров* (Expert, 2018).

И хотя по итогам девяти месяцев работы авиакомпания уже рапортовала о прибыли 22,5 млрд рублей, ситуация все равно выглядит очень ***тревожной***(Expert, 2018).

Но обучив модель на всем входящем потоке заявок, при первом тесте мы получили ***ужасные*** *результаты: получилось, что каждый новый клиент сравнивался с более чем 30 тысячами, имеющимися в базе* (Expert, 2018).

The case of using the Russian adverb *настороженно* 'cautiously', which specifies the verb *относиться* 'treat' describes the attitude of an average contemporary Russian consumer towards communicating personal data via the Internet.

Как отмечают эксперты отрасли, российский потребитель, осознавший все преимущества онлайн-передачи и получения денежных средств, менее ***настороженно*** *относится к передаче в банк информации о себе посредством интернет, признает права и обязанности, вытекающие из удаленного общения, понимает суть входящих и исходящих денежных потоков, возникающих вне личных договоренностей клиента и банка* (Expert, 2018).

The second top verbally represented group of emotions is 'Delight, joy, cheer, contentment, tranquility' (5 lexical units with one-word usage each), consisting of 2 nouns (*счастье* 'happiness', удовольствие 'pleasure'), 1 verb (*наслаждаться* 'to enjoy'), and 2 adjectives (*довольный* 'pleased', *рад* 'happy').

The syntagmatic surrounding of the names of these positive emotions identifies their relation to financial and economic terms. Hence, a number of railcars were deducted from the balance with pleasure, some people prefer to enjoy their life between crises.

Они быстро приходили в негодность и с ***удовольствием*** *списывались с баланса как источник ненужной головной боли* (Kommersant, May 13th, 2017).

А между кризисами я ***наслаждаюсь*** *жизнью* (Vedomosti, December 21st, 2018).

The three clusters of emotions, i.e. 'Love, tenderness, liking, affection, gratitude', 'Suffering, regret, embarrassment, shame', and 'Insult, disappointment, discontent', were represented by 4 lexical units each.

All three usages of the verb *любить* 'to love' were identified in the article 'На что обратить внимание инвесторам в наступающем году' (Facts for investors to pay attention to next year).

Некоторые СМИ ***любят*** *сравнивать ВВП разных стран и динамику его роста* (Vedomosti, December 24, 2018).

Дальше по убывающей: Бразилия, Мексика, Турция, а для тех, кто ***любит*** *погорячее, – Юго-Восточная Азия или Южная Африка. Для инвесторов,* ***любящих*** *риск и умеющих с ним работать, очень привлекательным выглядит рынок российских акций* (Vedomosti, December 24, 2018).

As the context shows, mass media love comparing GDP of different countries and its dynamics. Here, the verb is the part of a complex predicate with the infinitive *сравнивать* 'to compare'. Investors may love hotter (*погорячее*) countries, or risk (*риск*).

The verb *любоваться* 'to admire' is used to describe the emotions of a person-consumer who has just bought some exclusive, vintage product, i.e. a Soviet railcar. Here, his quote uses the reflexive verb *понравиться* 'to be liked', which is formed by means of adding the prefix to the original нравиться 'to like'.

Мне она своей оригинальностью ***понравилась****! –* ***любуется*** *Александр своим приобретением, стоя возле одной из последних сохранившихся узкоколейных советских автомотрис* (Kommersant, May 13th, 2017).

The group 'Suffering, regret, embarrassment, shame' is verbalized through 2 verbs (обвинять 'to blame' and пострадать 'to suffer' (4 w/u)), one adjective (виноватый 'guilty' (2w/u)), and one adverb (мучительно 'agonizingly').

Being the most frequently used Russian lexical unit in our word list, the verb пострадать 'to suffer' needs to be analyzed thoroughly.

Единственная проблема заключается в том, что коммерческая ценность бывших участков первой линии от этой переоценки ценностей заметно ***пострадала*** (Kommersant, May 13th, 2017).

Так как мы придерживаемся позиции, что система безопасности должна иметь баланс между надежностью и удобством пользования сервисом, то перед нами встала задача, как закрыть 3 процента фродерских заявок, чтобы при этом не ***пострадали*** *97 процентов честных клиентов* (Expert, 2018).

При этом больше всего ***пострадали*** *внутренние направления – здесь убытки увеличились в 7 раз и превысили 34 млрд рублей*(Expert, 2018).

Экономика еврозоны, ***пострадавшая*** *от торговых войн с Америкой, по-прежнему близка к стагнации, и сигналов оживления пока нет* (Vedomosti, December 24, 2018).

The examples demonstrate various grammatical forms and contextual syntagmatic relations with the words from the financial area. Hence, commercial value may suffer; honest clients should not suffer; Eurozone economy suffers from trade wars with the USA.

It is worth mentioning that the group 'Compassion, sympathy' was not verbally represented in the articles under investigation.

Conclusion

The study performed shows active usage of emotional terms in the texts of contemporary Russian economic and financial mass media. Review of up-to-date literature on the problem proves relativity of this paper. The alphabet and frequency word list of the names of emotions, which were identified in the texts under investigation, as well as their consequent breakdown into ten clusters allowed us to perform a comprehensive analysis of the Russian emotive language.

It was identified and once again proved, following the most authoritative global scholars, that verbs dominate quantitatively both in the number of lexemes and in word usages. This fact makes predicates the main lexical and grammatical means of expressing emotions in the written language.

The analysis of the data obtained through creating the word list and authors' classification indicated the dominance of the so-called negative emotions in the contemporary Russian linguistic worldview. The following study of the clusters helped us to witness a wider image of verbal representation of emotions in Russian. Thus, it is obvious, that among the main stylistic devices used by the authors of journalist articles to describe feelings and emotions are similes, allusions to the items of pop culture, as well as personification of financial and economic phenomena.

The evidence proves that emotional language is interconnected with financial and economic terms. Further and more detailed investigations may cover lexicographic aspects, including even the composition of a dictionary of economic and emotive set phrases.

Abstract

This paper deals with the consideration of social justice crisis as an intrinsic factor of influence on social health and spiritual security of young Russian students, since social justice crisis is poses a threat to spiritual security of Russia. Within the scope of this paper, social health of young people implies a sense of social justice, a state of security of the vital interests of a young person from hazards and threats. The paper is based on the results of authors empirical studies. The sociological research of this phenomenon becomes especially topical due to the fact that it makes it possible to enter in the inner world of young people, which is closed to statistics, psychological, pedagogical and economical methods, hence, to comprehend the perception of social justice by young students, to comprehend axiological dispositions and expectations, to promptly notice anomie disorders among young people, as well as social illness.

Keywords: social health, young students, spiritual security, national security, social justice, social justice crisis, threats to security of Russia.

Introduction

The sociological research of social health of young Russian students which has begun in the Russian social and humanitarian science in the late XX – early XXI centuries, has become particularly topical at the present stage of development of society. The interest in the phenomenon of social health of young people, originally conditioned by global social transformations taking place in Russia (Cockerham, 2000), many of which significantly impaired the social standing of young citizens, became aggravated due to painful blows to their physical, mental, and social well-being. It is the the rising generations of young Russian students, the state of their physical, mental and social health are the main guarantor of security of the society. Therefore, the strategic task of state youth policy in the sphere of social health service in the context of provision of national security consists in formation, preservation and improvement of social health of young people (Vaskov et al., 2018).

In modern risk society, the right of young people for spiritual security is exposed to threats on the part mass media and the Internet which consistently disseminate information about the total social and economic crisis in the country, about the crisis of social justice and trust to social structures and institutions.

Axiological anomie has been rapidly proliferating in Russian society; moral values gradually give way to material values, and young citizens of new Russia realize that Russia suffered heavy spiritual losses as a result of democratic transformations, which were rather poorly compensated when compared with the scale of the ruins that Russian culture and spirituality as an identifying marker of Russian civilization, as pursuance of social health, good, beauty, truth and justice (Khachetsukov, 2007), have turned into. There was an urgent need to overcome the total immunodeficiency of social health and spiritual and moral principles, revival of social justice, equality, solodarity, unity of the split Russian society which cannot be achieved without common goals, spiritual and moral values, as well as without improvement and preservation of social health of people and provision of spiritual security (Tastan & Davoudi, 2018; Ajallooeian et al, 2015).

It should be noted that spiritual security is one of the most topical issues of our time, one of the most significant issues for a personality, family, and social health of Russian society. D.V. Zerkalov (2012), emphasizes that spiritual security is a system of relations between the subjects of public activities of daily living, which provides favorable conditions for the creation of spiritual life and healthy social and moral development. Moral values often act as sources of social health of society. Spirituality is the basis for almost all things that are related to personality, to its self-fulfillment, as well as mental and social health. The role of spiritual sphere in the formation of social health of society has been recognized by many experts who deal with the issues of social and mental health of a person, social groups and society as a whole (Vodenko et al., 2016; Shakbanova et al., 2016; Chiang & Tzou, 2018).

Social health of young students is determinated by many factors of social and personal nature: state of health of young people, quality of its integration into social life, degree of satisfaction with social benefits, level of trust, perception of social justice etc. In addition, we can observe the direct relation of social health of young people with social justice and spiritual security of the Russians (Vereshchagina, Gafiatulina & Samygin, 2015). Globalization that can be observed in Russian society, appears as a certain controversial process that includes new perspectives and opportunities as well as risks, challenges and threats to spiritual security of Russia. Under the influence of sociocultural contradictions, global problems arise which are associated with the system of "person and society" and are directly associated with the problems of the provision of social and spiritual security and the formation of socially healthy personality (Gafiatulina et al., 2017; Kabayeva et al, 2018).

Materials and Methods

So, what is a social health of young Russian students within the scope of this paper? In many studies, social health of Russian young students is treated as an integrative category, presenting the level of adaption of a personality in the social enviroment, the degree of its social activity and the level of spirituality, harmony of relationship between different social groups and other people, regulation of behavior adequate to the current norms and universal human values of society (Tsikaliuk, 2010), as well as a certain level of development, formedness and perfection of forms and methods of interaction of a young person with external environment; a certain degree of psychosocial and spiritual development of a personality which allows to successfully implement this interaction (Vedernikova, Byrdina & Povorzniuk, 2015; Kolpina, 2017; Tambunan, 2018).

By social health of young Russian people, we imply a peculiar kind of indicator of social attitude, that cannot be reduced only to the level of material wealth, self-awareness as justly rich or unjustly poor, but is a generalized characteristic of the satisfaction or dissatisfaction of a young person with their social standing in society in all senses (Gafiatulina, 2009), as well as the sense of protection and security of their development. Socially health, safe development and functioning of the younger generation of Russians implies ways of implementation of individual opportunities, personal and group interests of young people, preventing or eliminating the possible negative impact on society and its structures. The activities of daily living of a young person will be deemed to be socially healthy and spiritually secure, unless there is any damage, threat, harm and undesirable dynamics on the part of external effects in the development of various social phenomena and processes (in particular, such as social trust and social justice). This corresponds to the three fundamental elements of national and spiritual security: interests, threats, protection. In response to internal and external threats to the vital interests of security subjects and objects, the system of national security protection produces counter measures of sociocultural, health, education, sociopolitical, economic, spiritual and social nature, responses with a certain policy in the sphere of national security (Vereshchagina et al., 2015).

Hence, within the scope of this paper, social health of young people implies a sense of social justice, a state of security of the vital interests of a young person from a set of hazards and threats of various type and degree. In other words, social health of young students is mainly manifested as an assessment and experience of justice, protection and security by a young personality. In turn, it becomes clear that national security, social stability and sustainable favorable development of Russia and the younger generations of

Russians is mainly determined by the state of their social health, trends of efficient innovative development, cumulative increase in social capital (trust, solidarity, justice etc.).

However, reality favors the increase in social capital by no means. The main globalization trends consist in the exacerbation of social justice crisis and aggravation of social inequality (economical, sociocultural, educational, health etc.), as well as marginalization of young students and increased risks in the sphere of its social health as the most vulnerable population group (Gafiatulina et al., 2017). The prospects for solving these problems are largely associated with the problem of social justice crisis.

Results

So, what is the role of percepetion of social justice crisis in matters associated with the formation of social health of the younger generation and provision of its spiritual security?

The principle of social justice is to give the most competent and active young people an opportunity to fulfil themselves in the society which is necessary for personality development and formation of social health. The concept of social health in its most commonly encountered semantic meanings is interpreted as equality, which means that for all groups of young people, including students, equal rights and opportunities should be created. This is because the pursuance of truth and social justice – according to E. Fromm (2011), – is an inherent distinctive feature of the nature of a person. That said, the concept of "justice" itself can be diverse by its scope of application: social justice, justice in interpersonal relationships, justice in foreign relations, justice in terms of access to social benefits, civil justice, ethnic and racial justice.

The fact that in the modern context justice cannot be considered from the perspective of economics, politics or management only is quite obvious. First of all, such a definition acquires sociocultural, spiritual and worldview nuances. Thus, T.V. Shipunova (2005), points out that social justice is not just an equality of young people but rather a measure of common good (social adequacy) of laws and regulatory directions establishing and based on agreement supporting such order of daily living activities of various groups and communities which would contribute to survival and development of the society, and would provide the state of spiritual security and socially healthy living (Shipunova, 2005).

We can talk about social justice when certain relations acquire public form, public significance, as it regulates the relations of various social groups, personality and society, thereby contributing to the formation and maintenance of social health and spiritual security of these social groups and society.

As many authors have noted, the outlines of social justice still remain in the context of emotive empiric sensations reflecting a particular level of social health of a personality. Hence, today, in the era of global changes, every young person gains the right for their own personal and individual perception of social justice.

We define social justice as a measure of concordance of due and reward which implies that every young person should be given an equal and fair opportunity to fully realize their potential in terms of social health. And, when we speculate in a more practical sense, no one should be placed in adverse conditions for the fulfilment of this potential, if they can be avoided. The term "injustice" refers to differences related to social health, which are not only preventable, but are also considered unfounded and unfair.

When we assessed social health of young students, we were guided by the self-evaluation of manifestations of social justice in the realization of essential needs, which, in turn, are derived from the system of social benefits and their distribution in the society.

Consequently, the more young people feel the lack of social benefits, the lower is the level of their social health and the sense of their spiritual security.

So, how do young students treat social justice through the prism of their social health?

In order to determine the level of social health of young people, we used a questionnaire (written questionnaire) which was conducted among respondents with the use of a special sampling method. According to the results of our questionnaire which was conducted in November and December of 2017 among young students in four regions of the South of Russia (Rostov Region, Adygea, Dagestan Republic and Chechen Republic), the following rank breakdowns were obtained in response to question: "Which manifestations of social justice are the most important and significant for you?". They are presented in Bar Graph No. 1.

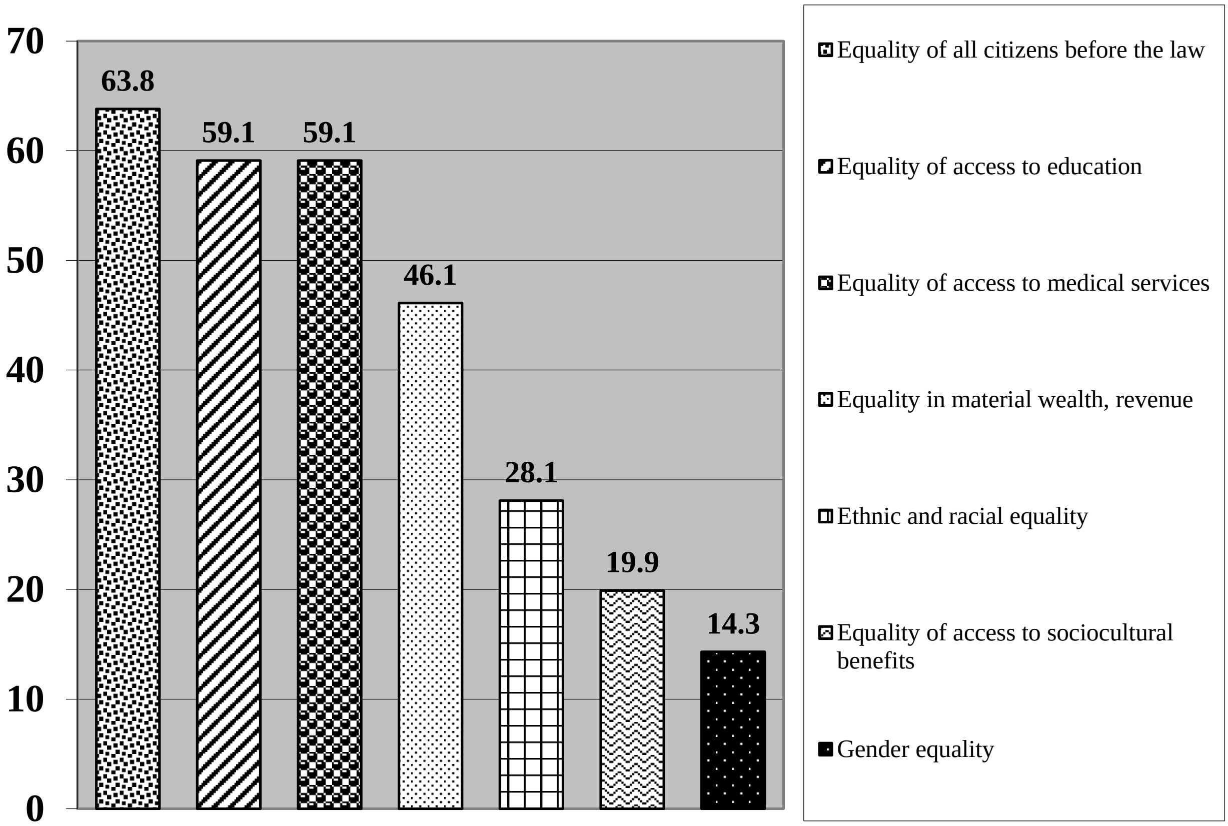

Figure 1. The most important and significant manifestations of social justice

The breakdown of answers to the question ***"Which manifestations of social justice are the most important and significant for you?"*** *(the answers are presented in per cent of the total number of respondents)*

As can be seen from the Bar Graph, according to all respondents, the dominating indicators in the definition of social justice are as follows:

– first rank position: 63.8% of respondents chose "equality of all before the law";

– second rank position is shared by two indicators: 59.1% – "equality of access to education" and "equality of access to medical services";

– third rank position: 46.1% of young respondents chose "equality in material wealth, revenue".

Looking at this breakdown, it is hardly surprising that more than half of young respondents gave the first two ranks to position of "equality of all before the law", "equality of access to education" and "equality of access to medical services". This is because young students are hoping to improve their social standing in the future, the assessment of the perception of social justice belongs to the main public life spheres: legal, educational and medical. The social and economic standing and equal opportunities in terms of access to education and health service – the main factors determining the achievements of young students, hence, the state of its social health and subsequent line of life.

In addition, it should be noted that the factor of national and racial equality is equally important for every third respondent (28.1%), where it should be noted that sociological research was conducted in a multicultural space. Chechen Republic, which is a single-ethnic formation, is the only exception. It is commonly known that the signs of zenophobia and nationalistic trends in modern Russian society leading to intolerance in mass consciousness and crowd behavior could be observed at the national level (Gryshai et al., 2018), which is indicative of social illness and threats to spiritual security of young people and poses a direct and visible threat to national security of Russia. The presense of such positions in the attitudes is apparently promoted by a fairly complex sociopolitical situation of instability and riskogenics in the Russian Federation, the loss of principles of international education, as well as international communication which existed in the socialist period of culture and contributed to the formation of the sense of security and protection, hence, the formation of high level of social health. At the same time, it should be noted that there are quite intrinsic factors that fuel destructive forms of manifestation of ethnic component (ethnofavoritism, ethnodomination, ethnocentrism), driven by the activities of the national elite, as well as strengthening of faith-based component, the threat of religious extremism and terrorism, which eventually give rise to the negative perception of a representative of another ethnos or another race. It is worthy of note that manifestation of ethnocentric attitudes is typical for young people living in big metropolitan cities under the conditions of increasingly aggravating and expanding migration (Deaux et al., 1995), which consequently results in the change in spiritual and sociocultural space.

In addition to the above, every fourth respondent is concerned about the problem of equal access to sociocultural benefits, which holds some validity as well. Thus, young people living in large administrative formations, do not feel any lack of necessary knowledge or entertainment (cinema, therater, schools of various vocational-oriented education), then, as is known, such problems are available in populated areas located far from the center; moreover, they only get worse over time.

In addition, every seventh young respondent is concerned about gender equality, and this problem is probably very pressing in the republics with people of Islamic faith.

If we look at the results of our research broken down by sub-arrays (Rostov Region, Dagestan, Adygea, and Chechen Republic), we can notice certain distinctions which are indicative of the trends of aggravation of social inequality of young people by regions.

Thus, if the key factor of manifestation of social justice in modern Russian society is "equality of all before the law" for the entire array of respondents, young students in Dagestan have shifted it to the second position, giving way to "equality of access to education" (62.7%); the respondents from Chechen Republic ranked the last factor second (59.7%), while the respondents from Adygea (59.1%) and Rostov Region (56.4%) ranked it third.

Therefore, "equality of access to medical services" – 62.6% and 59.3% is prioritized by young students of the Rostov Region and Adygea, whereas its significance is a little bit lower for the citizens of the Chechen Republic (57.3%) and Dagestan (56.9%). Hence, the absence of the factor of equality of access to medical services for young people in the Rostov Region and Adygea intensify the sense of lack of social benefits, thus reducing the level of its social health and spiritual security.

Moreover, the manifestation of social justice consists and "ethnic and racial equality" for every third respondent in Dagestan and Adygea, and for every fourth respondent in Rostov Region and Chechen Republic. The gender-based status and gender equality are of more concern to young students in the Rostov Region (17.1%), Adygea (15.9%), Dagestan (13.6%); it is of the least concern among respondents from the Chechen Republic (8.1%). And this is despite the fact that we are witnessing the strengthening of national (ethnic) identity, and accordingly, traditional culture, which has deeply rooted traditions of harmonious interaction and interrelation of genders (Shakbanova et al., 2018).

Further in our research, the respondents were requested to specify the factors of social injustice. When answering the question: "Which manifestations of social justice are not observed in modern Russian society?" the following rank breakdowns were obtained. They are presented in Figure 2.

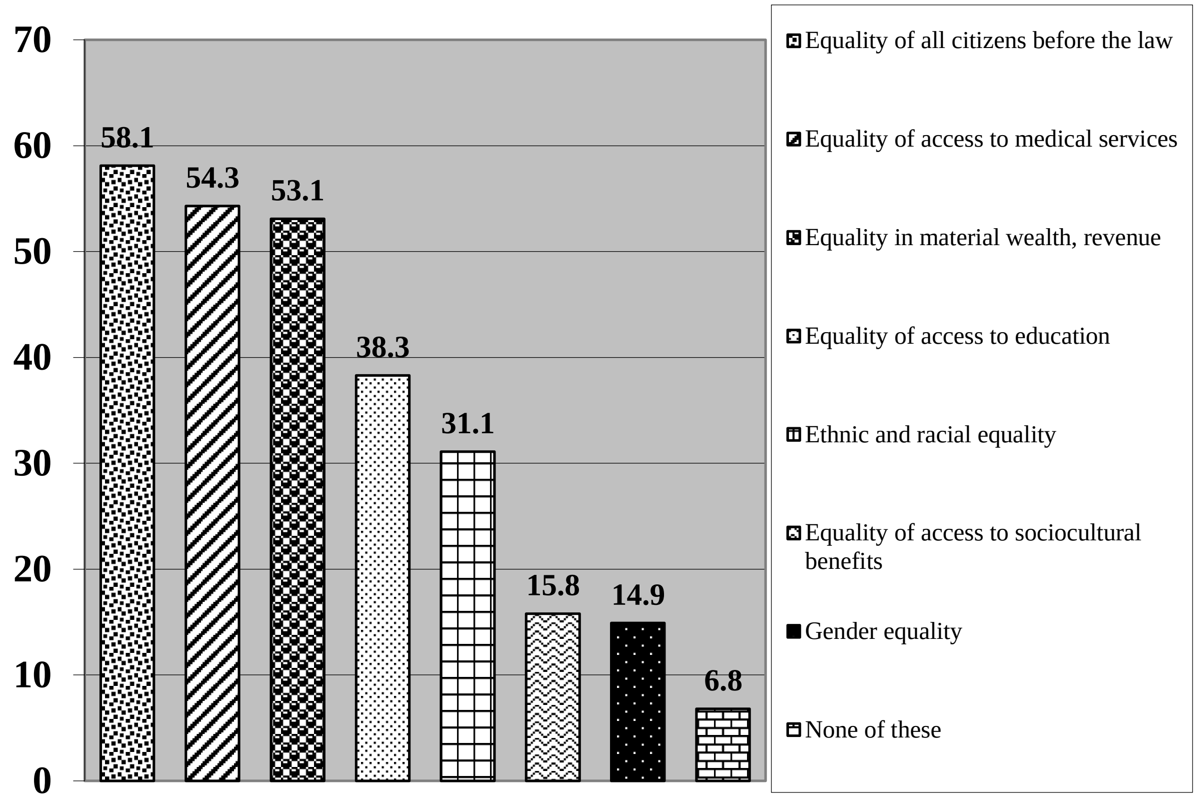

Figure 2. The manifestations of social justice in modern Russian society

The breakdown of answers to the question ***"Which manifestations of social justice are not observed in modern Russian society?"*** *(the answers are presented in per cent of the total number of respondents).*

Hence, figure 2 shows us that two factors ranked first throughout the entire array of young respondents: "equality of material wealth" and "equality of access to medical services" (48.8%). The factor of equality "of all citizens before the law" (46.5%) ranked second. The factor of ethnic and racial inequality (34.9%) ranked third.

Therefore, we can state that young students остро ощущает various manifestations of social injustice in modern Russian society, which poses a direct threat to its social health and spiritual security.

Discussion

Social justice is a category which characterizes the measure of equality and inequality in terms of position of various groups and individuals, objectively determinated by the level of material, social and spiritual maturity, as well as the state of physical, social and mental health. According to V.E. Makarov (2011), correlating young people with their behavioral strategies of living, social justice determines "in what and how people should appear as equal to each other, and in what and how they can and should differ from each other". Moreover, such a comparative position particularly applies to modern young people. However, it must be borne in mind that perfect equality among young people can be a source of social injustice, conflicts, as well as a threat to public and spiritual security. It is reasonable that the problem of social inequality acquires particularly social and historical ring, is tied to national specificity of Russian society and various groups and communities. We must not forget that new forms of social differentiation of population at large, especially its younger portion, arise in the controversial and complex process of global transformations, significantly impacting social health and sense of spiritual security of young people.

In his research on sociocultural factors of Russian stagnation and modernization, N.I. Lapin (2013), makes a pessimistic forecast with regard to the growing threats and challenges to security of Russia, and is indicative of a pressing need to build a fair society with equal opportunities for every person.

The sense of social injustice expresses the "breakdown of public relations" and is a clear sign of social tension and instability in relations, security threat, and social illness. It follows as a logical consequence that the sense of justice (injustice) impacts on the formation of a particular social health among young people, effectively forming prerequisites for a particular level of social health.

Conclusions

In general, according to our empirical studies, the trends of the growing social justice crisis in Russian society, undermining social health of young people, are defined by the following factors:

– social deprivation, limitation of access to material, social and spiritual resources, that are so necessary to meet the basic needs of young people for the provision of spiritual security and the formation of socially healthy personality;

– significant changes in the system of employment of modern young students and awareness of difficulties related to their potential employment (78.3% of respondents are concerned about employment difficulties in the future, thus they rate them as insecure);

– social anomie and a sense of insecurity which consists in virtually total destruction of one system of rules, norms and values, and vagueness and immaturity of other axiological and normative system;

– a decrease in the level and quality of life of the overwhelming part of young students, as well as the mode of life which changed for the worse are perceived as a threat to personal security and are characterized by a sense of lack of protection of rights of a person.

Abstract

This article describes the possibilities of social technologies in the practice of health saving within the educational and professional socialization of the Russian student-age population in view of the conditions of social uncertainty of the Russian society. The educational process should be organized according to the principle of pedagogical health-saving technology – i.e., it should be an ordered set of actions, operations, and procedures that ensure achievement of the forecasted result in the changing conditions of the educational and socializing process. The authors also offer the proprietary health-saving technology, based on the factors of the educational and professional socialization of student-age population, which has the person-oriented direction.

Keywords: health-saving technologies, health-saving educational andprofessional socialization, student-age population, conditions of social uncertainty, factor technologies,
person-oriented direction.

Introduction

In the modern socio-economic conditions of global changes and the change of the paradigms of public values, the state of physical, moral, and social health of the youth attracts special attention of the specialists of various spheres of science, medicine, and education (Beregovaya & Radomskaya, 2017; Almasi & Khorasgani, 2018), who develop new health-saving technologies. It is obvious that effective professional activities could be conducted only by the specialists who are physically, morally, and socially healthy and who can see and understand a rather wide specter of manifestations of the social and professional reality, perceiving the world in its integrity (Vodenko et al., 2016; Kousmartseva, 2016, 2017; Tastan et al., 2018; Murasheva et al, 2018).

The sphere of professional education and professional socialization becomes of top-priority, and its contents are a factor of economic and social progress; it should be oriented at provision of self-realization of a person and creation of conditions for a person's development in the personal and professional spheres (Gafiatulina et al., 2017).

Health of student-age population, its physical, moral, and social development, and the processes of socialization and adaptation in the educational and professional sphere are determined by the conditions of its social life in the modern Russian society, in which transformation processes has acquired a permanent character – which adds uncertainty and instability to all spheres of life activities, including the sphere of professional and educational socialization of the Russian student-age population (Shakhbanova et al., 2016).

In the conditions of transition to the intensive type of development of economy, health acquires the role of inseparable factor of professional growth. Aggravation of health and increase of the processes of marginality and self-destruction of a large part of student-age population are a logical consequence of bad self-preserving behavior against the background of intellectual pressure.

Health-saving professional socialization (hereinafter - HSPS) of student-age population at this stage of development of the Russian society should be studied in the context of the tendency of growth of socio-political tension among the population (Vaskov et al., 2018) and formation of the space of social uncertainty as a real space of implementation of life practices, strategies, and plans of student-age population.

The federal program of development and modernization of education sees one of the main goals as the necessity for preserving and strengthening of health of student-age population, development of health-saving technologies, and formation of the value of health and healthy way of life in the educational and socializing process.

Materials and Methods

The problem of health-saving technologies has been studied in the socio-pedagogical practice for quite a long time, but this is not enough for mastering and establishment of the corresponding value orientation with student-age population. Unfortunately, in most cases socio-pedagogical practice is oriented at saving the health of young population as an independent goal, and it should be considered in the context of educational and professional socialization and formation of settings for healthy living as personal components in view of the modern conditions of social uncertainty.

The process of solving the task of health saving and integration of health-saving technologies in the process of educational and professional socialization of the Russian student-age population is peculiar for diversity of the directions of development (social, ecological, psychological, biological, etc.). The conclusion of the modern researchers that health is formed under the influence of a lot of internal and external factors causes no doubts. Therefore, it is not only a medical & biological but also a socio-psychological category. The Russian higher school requires a comprehensive concept of health-saving education, aimed at health-saving professional socialization with application of the social technologies.

Social technology, being a phenomenon of social practice, is a complex of methods that ensure achievement of favorable conditions of life of youth (in this context, favorable conditions of their educational and professional socialization). The emergence of social technologies of health saving is connected to the need for quick and large-scale "multiplying" of new types of activities, ideas, and projects in the sphere of social healthcare (Patrushev, 1998). Usage of its certain types determines the effectiveness of social management of the process of educational and professional socialization of student-age population.

We treat health-saving professional socialization as a targeted and well-coordinated formation of value attitude to health by all agents of socialization. The purpose of HSPS is personality of young specialist, who has resilience to bad habits and forms of behavior and who has settings for healthy life and is oriented at the system of values in which the value of health occupies one of the most important positions (Vereshchagina et al., 2015).

Speaking of the process of HSPS, it should be emphasized that this process cannot be studied unilaterally, only as student-age population's acquiring social norms and values as to health. The process of health-saving professional socialization should be treated as a bilateral process, which includes also active reproduction of social relations by a young person. Positive socialization, being a continuous and bilateral process of interaction between a young individual and society, should allow the society to preserve stability, translation, and development of culture, and the individual – to acquire the culture, social norms and roles, and qualities that are required for inclusion into the society. Bilateral social exchange as a result of health-saving professional socialization takes place through the following processes: interiorization – student-age population's acquiring social experience; exteriorization – implementation of new elements into social life. A young person does not just acquire social experience of health-saving behavior, he transforms it into own values, setting, and orientations. Social activity of student-age population in the sphere of health saving is one of the main qualities of educational and professional socialization.

Real and educational and professional socialization of student-age population and receive life experience form under the influence of two main factors: professional and socio-psychological. Thus, we distinguish socio-psychological and professional adaptation (socialization). The former envisages acquisition and development of own style of behavior, as well as young person's joining the group and adaptation to various socio-economic conditions; the latter socialization envisages acquisition of the character, contents, conditions, and organization of the educational process and development of skills of independence in the educational activities (Mendoza Velazco & Rivero Padrón, 2019).

The society of risk and uncertainty as a social reality sets completely different technologies, models, forms, and landmarks of professional socialization, social formation, and development of student-age population, which is orienting at the present day and its priorities and values (Zubok, 2007; Zubok & Chuprov, 2008). Developments in the sphere of changes in the sector of social development of youth from the positions of social uncertainty and risk level in the Russian realia belong to Russian sociologists V.I. Chuprov and Y.A. Zubok (2004). Uncertainty in a wide sense is unclear and unrealized processes and phenomena in society, blurry ideas of the environment, evasive statements or behavior of individuals and groups of people, and absence of clear connection between social phenomena and their consequences (Chuprov & Zubok, 2004). The notion "uncertainty" is used for studying the transitional and marginal states, and the youth usually are in these states. According to V.I. Filonenko and A.P. Lepin (2013), "student as an object of socialization influence occupies an intermediary position between children and adults, having the specifics and features of the former and the latter".

Within this article, we study social uncertainty as the state of impossibility of adequate reflection, in which student-age population finds itself, connected to its internal disorganization as to own health: practices of its formation, preservation, and strengthening due to increasing instability of social reality.

Social uncertainty is also connected to infinity of social connections, their manifestations, characteristics, and measurements. It is closely connected to the category of choice. The choice in the aspect of self-preserving or self-destructive behavior of youth as to own health is no exception. Therefore, we have a task of formation of correct choice in favor of social health saving of student-age population, as a lot of social phenomena and processes are perceived with the help of various empirical methods, with modeling methods being no exception.

Social technologies in the sphere of health saving of student-age population could be viewed as a totality of operations and procedures of social interaction on the path of obtaining the optimal social result (improvement of health, improvement of living conditions, etc.). Social technologies are the most important element of the management mechanism (Ivanov, 1996).

Development and implementation of health-saving technologies in the process of educational and professional socialization require certain conditions: personnel provision, license for conducting health-saving and educational activities, and presence of the corresponding medical and social department.

Results

We treat health-saving technology of professional socialization of student-age population (hereinafter - HSTPSSAP) as a conceptual tool that is oriented primarily at management of the modeled process of health saving. The function of prediction serves the goals of health management.

HSTPSSAP has to meet certain requirements; it should be an objective correspondence to the modeled object of educational and socialized practice; it should be interpreted in the terms of health-saving pedagogics. The essential level of HSTPSSAP is formation and acquisition of the professional system of values in view of the situation of uncertainty and risks in society, certain behavior, social activity, initiative, and orientation at healthy living.

Among the technologies developed for understanding and forecasting behavior that is connected to health-saving educational and professional socialization we want to consider two foreign technologies: the technology of formation of precaution and the technology of health beliefs.

The first technology HSPS is the model of formation of precaution; it was offered by N. Weinstein and later improved by him and P. Sandman (Weinstein & Sandman, 2002). In this technology, it is offered to distinguish seven stages in the process by which the youth adapt precaution, this changing the behavior that threatens health.

The first stage is absence of realization of the problems with physical (somatic), moral, and social health with a person. Receipt of information from socialization agents regarding this problem corresponds to realization of the problem, but the youth is not involved in any behavior (second stage). The third stage correlated with the moment of decision making, when a young person receives the opportunities (i.e., choice in favor of self-preserving or self-destructive behavior) – not to adapt the precaution (the fourth stage) – then this process ends, or adapt the precaution – (the fifth stage). The sixth stage – execution of the specific health-saving behavior, the seventh stage corresponds to supporting new behavior in time. It should be noted that the advantage of this technology is post-stage character of change in the youth environment of behavior that is concerned with health. It should be emphasized that this technology opens a possibility for developing the preventive programs in the HSPS process, which take into account distribution of young people among various stages and offer the corresponding information for the student-age population, contrary to the companies that work with everyone.

The second technology is the technology of health beliefs is especially interesting, as it is considered to be the basis for developing preventing and health-saving professional and educational programs with primarily socialization direction (e.g., concerning sexually transmitted diseases (Salovey, Rothman & Rodin, 1998). The main provision of this technology is that behavior of a young person, concerning his health, is forecasted based on the formed beliefs regarding the threat to health and the corresponding behavior. Treatment of the threat to health should make young people perform certain actions, and beliefs of certain behavior determine the plan of these actions. The probability of the fact that the young person takes a preventive action depends on the following factors: firstly, whether he, socializing professionally, realizes that the negative condition could be avoided; secondly, whether he has positive expectations for execution of a certain self-preserving behavior; thirdly, he is confident that he can perform the necessary actions.

The formula that reflects this technology has the following form:

Action = (perceived seriousness of disease (threat to health) X perceived vulnerability as to the disease) X (perceived barriers – perceived advantages) (Salovey, Rothman & Rodin, 1998).

Empirical studies showed that preventive (health-saving) behavior is connected to perceived barriers on the path of the action, advantages from the action, and vulnerability to threatening situation, but are not connected to seriousness of the threat (Salovey, Rothman & Rodin, 1998).

It should be noted that this technology is referred to by the methodology of research performed by the World Health Organization, knowledge – attitudes – beliefs – behavior (World Health Organization, 2008).

However, despite the attractiveness of this technology, there's also one limitation which consists in the fact that this HSPS does not allow solving one of the main problems in the environment of student-age population, namely – predicting transition from beliefs to health-saving behavior. For example, the youth may have good knowledge of AIDS, but this information is not connected to their sexual behavior, which shows the absence of direct and rational connection between knowledge and behavior (Gafiatulina, 2009).

We suggest expanding this technology for its applicability to the Russian social conditions. The new model has the following blocks: "awareness of student-age population", "need for heath", and "medical and preventive activity". The medical and preventive activity of the student-age population is the activity in the sphere of protection of health. This activity depends on the general level of development, education, socio-psychological settings, life conditions, etc. (Figure 1).

The indicator of awareness in the sphere of health is especially important in evaluation of conscious self-preserving (or self-destructive) attitude to health (Gafiatulina, 2009). The object of awareness is knowledge of the student-age population of bad habits and their damage to health and risk factors; knowledge of a certain set of data of one's body, past diseases, etc. The level of youth's realization of behavior regarding health could be evaluated only with information on the level of awareness.

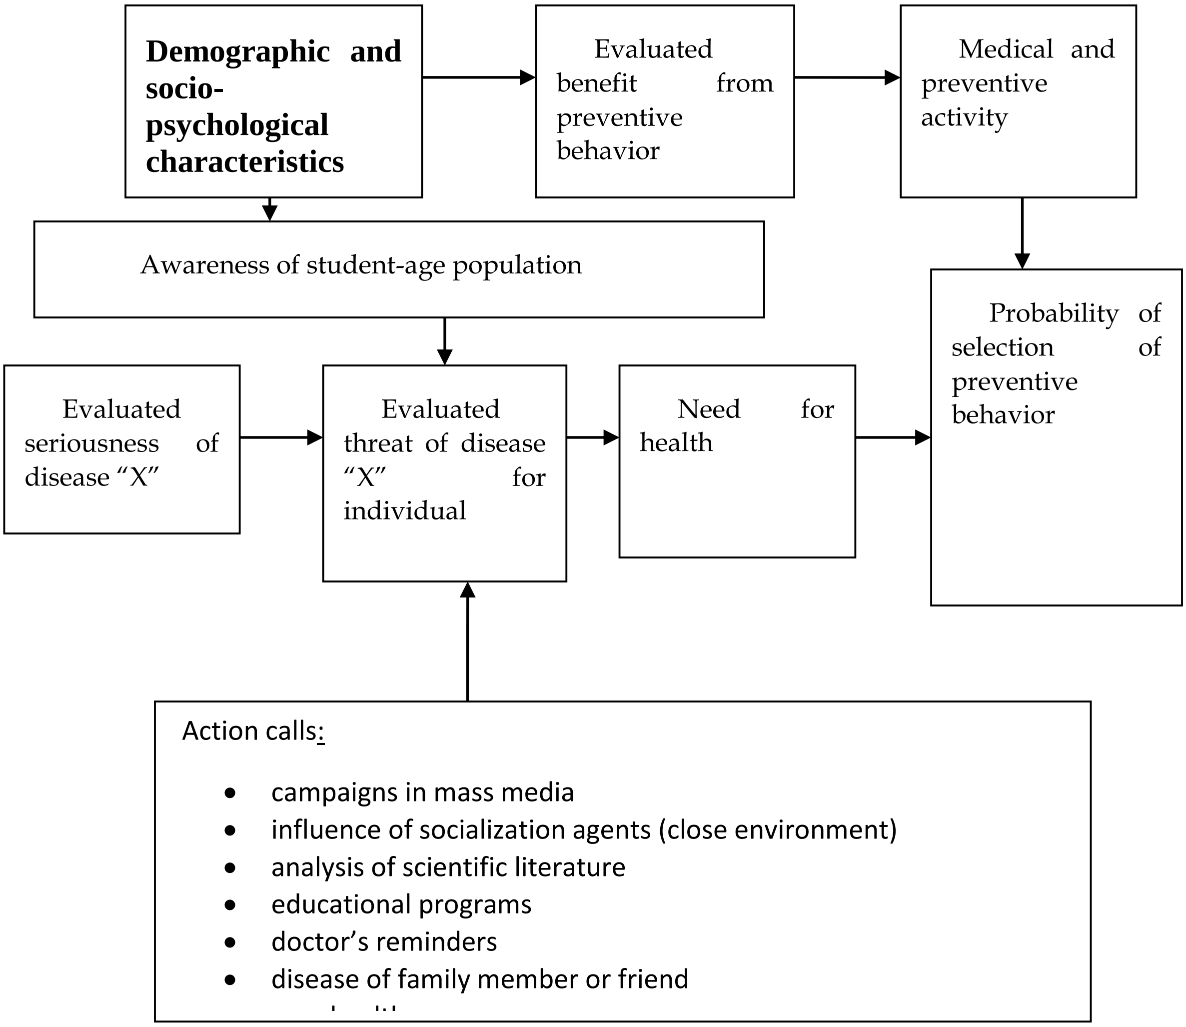

Figure 1. Factor technology HSPS

Medical and preventive activity and the need for preserving health, together with evaluation of the level of awareness of the student-age population, allow forecasting the probability of selection of preventive behavior. The block of factors that are shown as "action calls" (for the purpose of actualization of health), should include, apart from campaigns in mass media, analysis of scientific literature and educational programs. In view of the influence of the close social environment in the youth's selection of the strategy, it is necessary to include and assess the role of all subjects that influence the decisions on observation of recommendations for preservation of health or their refusal.

We think that HSTPSSAP, with person-oriented direction, envisages social development and socialization of student-age population, which is treated as a comprehensive process of qualitative changes of its essential characteristics, aimed at successful educational and professional socialization and self-implementation of a young personality.

We also developed a new person-oriented model of HSTPSSAP (Figure 2).

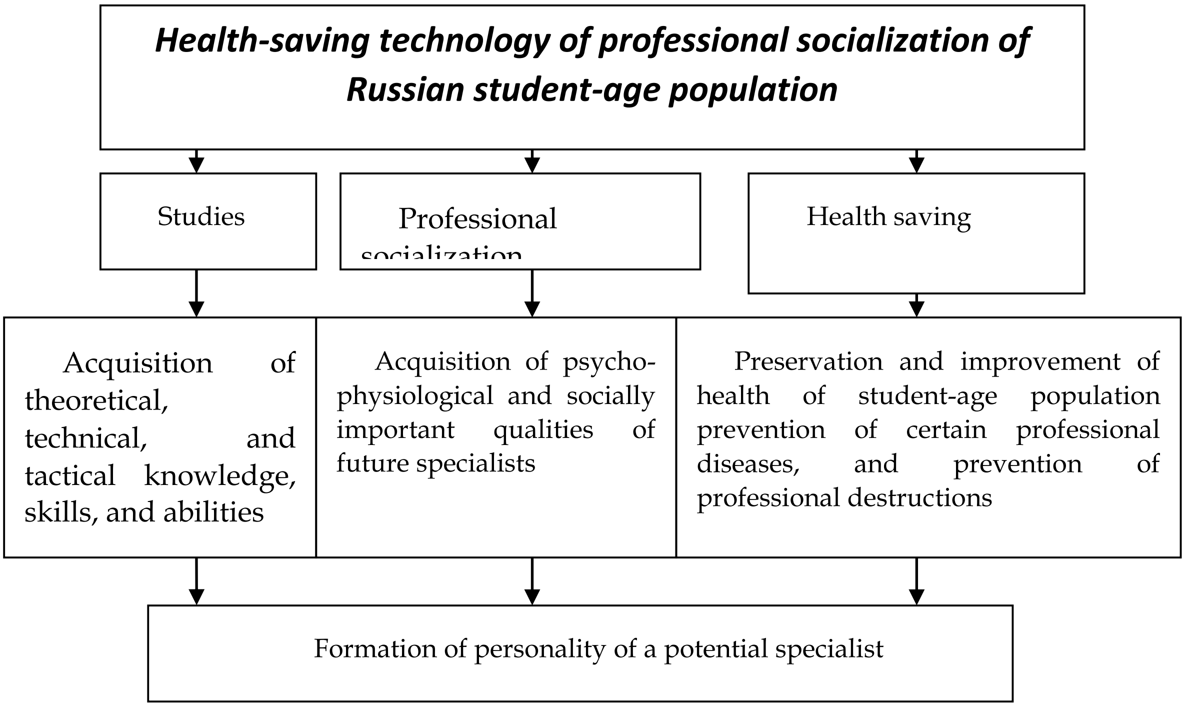

Figure 2. The person-oriented model of HSTPSSAP

In this model the blocks studies, professional socialization, and health saving are the tasks oriented at supporting the educational process.

HSTPSSAP is based on activity, problem, rapid, and situational approaches. Therefore, these social technologies create the conditions for manifestation of activity and independence from the student-age population. This activity is presented at three levels: reproduction activity, activity of interpretation, and creative activity. Students are the subjects of own study and study of health saving on particular. This is the main purpose of person-oriented and health-saving education.

Discussion

Higher education becomes an inseparable part of the Russian economy. It should be "convertible", ensuring socio-professional mobility and competitiveness of young specialists. This requires modernization of higher professional education and adoption of the innovational concept of professional development of students, leads to necessity for scientific modeling of the educational process and development of new pedagogical technologies that integrate study, upbringing, and development of a taught person and the student-age population (Vinogradova et al., 2018; Bahremand, 2015).

Educational process should be organized by the principle of pedagogical health-saving technology – i.e., present an ordered totality of actions, operations, and procedures that ensure the achievement of forecasted result in the changing conditions of the educational and socialization process.

Technology (model) is a totality of means and ways of receipt and processing, an analog of a certain fragment of natural or social reality, a sample of human culture and conceptual & theoretical pre-education. According to V.P. Svechkarev (2010), based on the practice of the technological and model approach, the most important are "the tasks of analysis and forecasting of development of the processes in the humanitarian sphere. Such tasks are connected to the forecast of achievement of long-term goals by adaptation to the changes of the external environment. The tasks are complex and require consideration of a large number of factors, interests, threats, and consequences" (Svechkarev, 2010).

E.B. Olkhovskaya (2007) treats the sports and game educational technology, aimed at health saving of student-age population, as a pedagogical technology based on integration of a sport game (physical culture) and educational process, which is a totality of means, methods, and forms of organization of subject-object-subject targeted sports activities of student-age population on self-development of personality, which will ensure guarantee of the forecasted result in the health-saving educational and professional space (Olkhovskaya, 2007).

We think that emphasis in HSTPSSAP should be made on formation of such system and structure of the thinking, practical, and moral activities that will allow future specialists to independently navigate in the increasing flow of educational and scientific information and to adapt and socialize in the changing socio-economic and technological conditions. This approach envisages re-orientation at person-oriented character of HSPS with mandatory usage of the practice-oriented technologies of organization of the educational process. According to A.G. Asmolov (2000), "the most important thing is to avoid education's orientation at solution of typical tasks, which already have answers to the questions, but to say, 'Education must help a young person to live in the world of uncertainty'".

Conclusions

Generalizing the theoretical and practical developments on the problem of implementation of social technologies in the process of health-saving professional socialization, it is possible to conclude that the functions of health-saving technologies of socialization could be united into two groups: preventive and stimulating the protection of health of the student-age population; each function is implemented through usage of various technologies.

Thus, health-saving technologies are not of only the professional and educational direction, developing competences and meta-professional qualities of future specialists, but also perform health-saving functions of socialization in university's educational space. All this stimulates successful professional development of the Russian student-age population.

Abstract

The article analyzes the social mechanism of regress to archaization under the influence of processes occurring in mass society. It emphasizes the role of sustainable social practices that have emerged in such areas of society as politics, public administration, education, the army. Archaization is a natural reaction to the elimination of the political sphere, militarism, education reform, and the current type of administrative and political elite. The paper deals with the problems associated with the manifestations of archaization in social practices in terms of mass society's challenges, the circumstances of archaization development in the practices of power and organizational and managerial relations, trends and forms of archaization manifestation in educational practices.

Keywords: social practices, education, archaization, corruption, hazing, conservatism.

Introduction

The author's reflexive emphasis in this study is mainly focused on the intersection of the problems of finding out the heuristic possibilities of *archaization* concept and the characteristics of this social phenomenon manifestation in modern Russian society. In the socio-philosophical context, one of the most significant consequences of socio-cultural changes is the rapid change in the state of society under the influence of internal and external factors. *A person revises the foundations, traditions and values* within the space of socio-cultural changes. In addition, it concerns both norms and methods of communication. Such a change in the subject of socio-philosophical reflection entails the need to consolidate a new public discourse, the construction of adequate theoretical and methodological toolkit that could more adequately reflect the characteristics of change. Thus, the relevance of the socio-philosophical study of archaization in Russian society is determined by the following circumstances. First, it is a weak theoretical and methodological development and empirical study of various manifestations, trends, levels and forms of archaization in society. Secondly, the importance of this topic is in understanding the social practice of social development and socio-cultural transformation of Russia. Thirdly, there is an urgent need to determine *the status of the current Russian realities* in the context of socio-cultural changes at the levels of social practices and mass consciousness *in social and philosophical thought.*

The aim of the study is to analyze the manifestations of archaization in the social practices of the emerging mass society.

The study objectives: to consider the archaization of social practices in the context of challenges of mass society; to reveal the manifestations of archaization in the practices of power and organizational and managerial relations.

Materials and Methods

The theoretical and methodological basis of this study are the theoretical attitudes and ideas set out in the works of researchers devoted to the study of various aspects of the phenomenon of archaization in society, as well as general scientific methods of social cognition – analysis and synthesis, induction and deduction, abstraction and typing. We used the principles of studying social phenomena in the framework of classical and post-non-classical scientific paradigms. In order to identify the socio–cultural foundations of the content, levels and modes of archaization in modern Russian society, the author relies on theoretical approaches to understanding society as a space of socio-cultural transformation in the coordinates of modernization and de-modernization. Among them: a) socio-cultural approach; b) the concept of *challenge of modernity*; c) the theory of *de-modernization* and *feudalization*; d) the concept of *man-mass* and mass society.

Results

In the situation of increasing archaization in modern Russian society, social practices primarily experience its influence, acting as a kind of resource in the difficult conditions of the transition period.

Archaization appeals to the basics of sociocultural experience of society and has a well-defined *object* of treatment.

No wonder A. Ryabov (2008) proceeds from the fact that in this existence *rudiments of the past* appear. In an environment where business is widely dependent on the state and authorities, officials consider positions that allow them to extract rent as reliable ways to generate high incomes. It is necessary to refer to the archaic and coming from the ruling elite frank propaganda of anti-egalitarianism, class, corporatism, which contradicts the social dynamics of modern society.

Archaization of social practices in the context of the challenge of modernity has undergone a noticeable evolution in Russian society.

In the 1990s, after the collapse of the Soviet state, social chaos and some *primitive jungle* reigned. As in the natural jungle, in the social jungle the process of adaptation and natural selection of the best individuals, depending on their functional affiliation began.

Nevertheless, in the first decade of the twenty-first century, the situation began to change. The current conditions began to contribute to the manifestation of certain trends in public attitudes, which acted as sources of archaization. Accordingly, it is in the first decade of the twenty-first century that the ruling elites consciously and purposefully begin to act in the direction of archaization in order to stop the changes. All this collectively had an impact on the practices of social and cultural interaction and the existence of life.

Technologies of political influence are activated– that is, a set of rules, procedures, methods of influence on the political process, which provided a specific actor with optimal and effective implementation of his/her goals and objectives.

In fact: the number of prisoners per capita in Russia is much higher than the post-Stalin level (with, as far as one can judge, the practical cessation of the fight against crime); Brezhnev gerontocracy looks competitive and self – renewing environment against the background of the current one, and corrupt party economic nomenclature is a crowd of disinterested, sincerely concerned ones about the welfare of the people (Shakhbanova et al., 2018).

The Soviet bureaucrats, who graduated from the locomotive College against the background of the current ones with Harvard diplomas, give the impression of deep intellectuals, and the scattering of money for manic ambitious programs against the background of modern *investments, innovations, infrastructure*, Olympiads and Championships, not to mention the infusion of money into the military-industrial complex, seems to be a long-term and over-rational investment. The fact is that the result of the described marvelous process was the return to everyday life of the most monstrous, the ugliest features of Soviet life, which professional Democrats with General relief declared long ago *eradicated*.

As a result, social practices as a set of traditional cultural ways of working, skills of dealing with people, following the rule, behavior that has a ritual nature and is based on collective ideas, expectations and standards are increasingly affected by the archaic component.

A number of researchers trace this to the practices of hazing in the Russian army. The modern author S.A. Korolev (2009) proceeds from the fact that hazing is Amateur and illegitimate analogues of corporal punishment, illegal, criminal practices and techniques of suppression of the weaker by the stronger. Another author A.Yu. Solnyshkov (2008) writes that in the army there are illegal social practices that distort informal relations between military-short-termers, significantly reduce the effectiveness of management interaction in military units. They have a negative impact on the prestige of military service, a destructive impact on the physical, psychological and social condition of soldiers and are difficult to social correction. In official documents, such practices are usually referred to as *non-statutory relations* and their unofficial name is *hazing* (Solnyshkov, 2008).

The penitentiary system has a *crippling effect on the human psyche*, which causes the growth of *asocial minded population*. "We have a cumbersome, expensive, allowing the constant reproduction of crime system of execution of criminal penalties, carrying systemic risks to the security of the country."

The Minister formulated the essence succinctly and clearly: we live in a Gulag and Royal penal servitude. Instead of correcting criminals, we turn them into repeat offenders, instead of returning normal people to society, we produce lumpens. Moreover, as in Russia, almost every or was imprisoned, or he has someone from relatives and friends who was imprisoned, it turns out that the tsarist-Stalinist penal system cripples the whole country. We in fact live in the gangster state. Where the criminal is a romantic hero, where the most popular songs are about thieves, where stealing is honorable, and killing a person is a common thing.

Archaization is manifested in the practices of forced (slave) labor. Speaking about the forms and types of forced labor, usually talk about physical violence or the threat of violence (including sexual); about the restriction of freedom of workers' movement; about the seizure and retention of documents; about debt bondage (debt for credit); about psychological violence: blackmail, etc.; about the retention of wages until the end of work; about the manipulation of the employee, etc.

Experts recorded the spread of particularly cynical forms of forced labor. All this takes place in the context of such new phenomena for Russia as illegal migration, the growth of asocial elements and marginalized groups (prostitutes, homeless people, street children, the poor, the unemployed, the sick, alcoholics), the spread of criminal practices of manipulating people, over-exploitation (Kovalev et al., 2016).

Thus, the archaization of social practices in the context of the challenges of mass society is largely because in Russia the consequences of globalization are layered on the processes of the collapse of the previous systems of social order. The new social reality, experiencing the manifestations of archaization, is characterized by crisis trends and characteristics, which is manifested in the deformation of the system of values, the crisis of identity, destructive adaptation strategies, social apathy, and alienation of the masses from the processes of social regulation.

The current social and political conditions contributed to the manifestation of certain trends in public opinion and in public attitudes, acting as sources of archaization, which was associated with the destruction of the existing cultural layers and the immersion of consciousness in the archaic layers of culture and archetypes of the collective unconscious. A larger-scale traditionalization of society began and an appeal to the largely *fictional* past, a return to the archaic, primitive, mythologized mass representations. At the same time, the ruling elites consciously and purposefully begin to act in the direction of archaization in order to stop the changes threatening their omnipotence (Lubsky, Kolesnikova & Lubsky, 2016).

The *Chekists* as the "fundamental principles" of the modern regime have their own corporate mythology. It says, among other things, that the Communist party, headed by its Secretary General, betrayed the Soviet Union. *Chekists* were not allowed to save the country because of a bunch of *traitors*. The mythologization of the image of Andropov is connected with this postulate. No wonder in the *chekist* environment, Vladimir Putin positions himself as the *second Andropov*. Now Russia is the *right* version of the USSR. Historical justice has been restored. Power is in good hands. The enemy will not pass. So due to the inertia of social processes and for a number of other reasons, a number of features of the Soviet model in an extremely deteriorated form was able to revive. The Soviet project had ended, but de-Sovietization of society and elites did not happen. Still, trying to copy the Soviet model with some modifications to solve the modern problems facing the country is as unrealistic as making a violin out of a balalaika (Lubsky, Kolesnikova & Lubsky, 2016).

The phenomenon of corruption is also associated with archaization.

Researchers from the Institute of sociology of the Russian Academy of Sciences believe that in the long-term approach the problem of combating corruption is inseparable from the struggle for the democratic organization of state power, which is perceived as the most *honest* form of it. Reducing corruption is one of the main conditions for the progressive and harmonious development of society in the world today.

Accordingly, archaism begin to influence and organizational relationships.

Mostly, the bureaucratic reality involves all the inhabitants of the state, who ever had to write any statement or just visit some institution or office to put the seal.

During the election campaign in the spring of 2012, Vladimir Putin in one of his program articles *Democracy and the quality of the state*, published in the newspaper *Kommersant*, rightly drew attention to the fact that "we need a new state consciousness, in the center of which – the creation in Russia of the best, most competitive conditions for life, creativity and entrepreneurship. In this logic, the activity of the entire state apparatus should be built... to Break the link *power – property*. The borders of the state and the limits of its interference in economic life should be clearly established" (Kovalev et al., 2016).

Indeed, a return to normalcy requires decentralization of governance, where each level and territory has its own autonomy and is capable of carrying out its own clearly defined tasks (Vodenko et al., 2018).

Now federalism and separation of powers exist only on paper. The three branches of government are practically fused together. Local, regional and regional-Federal authorities are working on the implementation of signals that come from the Federal center. As in the former Soviet Union, not the government implements the will of the people, and the people have to execute commands coming from the top.

Such phenomena, giving rise to a large scale of corruption in a variety of forms and manifestations, reminiscent of common in Russia XV-XVI centuries of *feeding* practice, when managers were sent to lead the local territories without paying their salaries for service, based on the fact that they will get the necessary funds as a result of extortion (Frolova et al., 2015).

The inspections carried out in 11 Federal ministries and departments revealed more than 47 thousand violations of the legislation on state and municipal service. According to their results, more than 600 criminal cases were initiated; almost 2700 officials were brought to disciplinary and administrative responsibility (Gorshkov & Trofimova, 2016).

At the same time, the volume of the corruption market was comparable with the Federal budget and was estimated at more than $ 240 billion. According to polls of All-Russian center for public opinion research, every third Russian demands death penalty introduction for corruption and economic crimes. Almost 40 percent of respondents are in favor of radical cleaning and reduction of the state apparatus. The same number of respondents consider it possible to make the confiscation of property of both corrupt officials and their family members a norm (Chernous et al., 2015; Hassan et al., 2019).

The rapidly changing social and political environment affects all institutions of society, primarily education. Educational practice as an integral historical socio-cultural organization of knowledge, thinking and activity, ensuring the reproduction of a certain social reality, is experiencing contradictory influences and challenges of our time.

Modernity as a concept is correlated with the problem situation in which society finds itself due to the collapse of the system of higher attitudes and values that previously legitimized its social orders, providing meaningfulness of the General *world picture* among the members of this community and being perceived by them as the highest and objective reality (represented mythologically, religiously, in the form of universal moral *laws of nature* or otherwise).

The challenges facing Russian education are multifaceted. Thus, the authors of the analytical report "*Modern challenges to the school and the system of socialization*" distinguish the following.

First - the crisis of childhood, which is expressed in the blurring of the boundaries between childhood and adulthood, and this process, can be described as *the disappearance of childhood* and as *the disappearance of adulthood.* Childhood disappears, as the modern media and communicative environment violates the system of filters and boundaries between the child and the adult world, destroys an unambiguous hierarchy in which knowledge, competence and experience were sent from the adult world to the world of childhood.

The reverse process-the infantilization of the adult world-is associated with the speed and density of innovation in modern society. The need to master these innovations and adapt to them actually denies adulthood as a stage of a fully formed personality, giving the adult the role of an eternal disciple (life-long learning, etc.).

Second - the speed of change and the uncertainty of the future. Due to the increasing uncertainty of the future, it is objectively impossible to predict the expected educational results, as true innovations are by definition impossible to predict. Directly teachers lag behind in the pace of development of new technologies and information from students. There is a gap in effective communication between teachers and students.

Third - the erosion of national identity. Globalization leads to the formation of the so – called *hybrid identity*: man's growing and development, the formation of his identity takes place on the material of two types of samples: national (local) and global (for example, world cinema, music). Apparently, the identity turns out to be fragmented (mosaic) in this situation.

Fourth - the increase in the volume of information. The modern information environment, first, the Internet, creates new opportunities and creates new risks for socialization and education. The increase in the volume and types of information flows leads to the spontaneity of protective forms of human behavior, which are not able to process large amounts of information in limited periods. The tendency is formed of simplification and *primitivization*, rejection of complex forms of culture and, above all, – thinking (Bedrik et al., 2016; Nebessayeva et al, 2018).

Against the background of these challenges in Russia, there is a strengthening of conservative, *protective* attitudes of public consciousness in relation to education. Education occupies one of the leading places in the hierarchy of values of Russian citizens, but there are no specific and clear criteria for quality education. Education turns from a functional good into a status one, into a necessary, but at the same time only a status attribute of the biographical trajectory. As a result, there is, for example, unmotivated by labor market demand for higher education.

Any attempt to revise the existing structure and content of education is seen as a limitation of the rights to free education. This challenge is intensified by: the General crisis of citizens' confidence in the government; the formed type of discourse on topical issues of society development (simplified, straightforward, aggressive, ignoring data, substantive arguments); the sectoral factor: the opacity of the education system, information asymmetry – the society has no objective idea of the quality of education, the real opportunities that this quality provides for socialization and professional career, the real content of the proposed reforms of education.

Sociological research conducted by the Institute of sociology of the Russian Academy of Sciences in 2014 in 23 entities of the Russian Federation, including two megacities (Moscow and St. Petersburg), showed that over the past two years in public life participated 23% of respondents with secondary education, 30%- with secondary special and 46% – with higher education. 46% of Russians with secondary education, 59% – with secondary special education and 63% – with higher education took part in political life. Respondents with higher levels of education participated in a wider range of political and social practices (Gorshkov and Trofimova, 2016).

Education, considered as a practice of human development, should be aimed at self-determination and self-actualization of the actor of educational activities to the available socio-cultural practices.

The analysis of primary results of educational reform in the Russian Federation at the end of the XX century – the beginning of the XXI century shows their halves and inconsistency.

There have been no fundamental changes in the system of mass education. Although the unified state examination, specialized training at the senior level of General education, two-level system of higher professional education have become reforms of a systemic nature, the subjects of educational activities usually consider them as superficial changes, and not affecting the essence of school or University life.

The main *clientele* of education is parents and students. Moreover, despite the dissatisfaction with the current *system*, they unconsciously continue to engage in the reproduction of the norms of educational practice that have become habitual.

Discussions

Political scientist V.B. Pastukhov (2006) writes that what is happening in Russia is an echo of world cataclysms. If we focus only on the sphere of spiritual life, we can conclude that the main challenge to humanity is associated with the *mass culture* of the West. Modern mass culture is the underside of the life of post-industrial society; it is a slag that poisons the whole culture. Mass culture has emerged as a culture of unlimited and wasteful consumption (Pastukhov, 2006; Aguilar-de Borja, 2018).

The formation of mass society on the Russian soil took place mainly in the same way as in Western Europe and the United States. However, this process began in Russia later and had some peculiarities.

The modern author R.N. Abramov (2010) comes from the fact that popular culture, as the dominant type of culture is the result of processes of society massivization. Mass society is nothing but a standardized society. The standard embraces not only the spheres of production and management, but also the sphere of leisure and consumption. It is based on technology regardless of its application. The very same existence of the standard is due to the functionality and the technological means and methods by which it is implemented.

According to G.L. Tulchinsky (2007), orientation to work (spiritual, intellectual, physical), tension, care, creation and equivalent exchange is replaced by orientation to gifts, carnivals and the holiday of life organized by someone. Mediocrity, categorically claiming all kinds of benefits of the world appears and is affirmed. As a result, there is a multiplying mass of people who want only one thing - let them be fed, watered and pleasured in every way.

Meanwhile, as Yu.N. Afanasiev (2001) says, in Russia there is a rollback, a steady return somewhere else in before capitalism, to caves. Involuntarily a thought suggests itself: maybe this is the social retribution for willful attempt to overtake everyone, to jump through something that is not experienced, not endured. And therefore may be archaic becomes the norm, filling all the pores of modern life that never was overcome, and, on the contrary, many decades, and even centuries the power trying to get ahead, just drove it into?".

At the same time, as M. Delyagin notes, "hatred of the Soviet civilization in the ruling and owning Russia hangouts phenomenally is one-sided. The consistent eradication of the *cursed scoop* steadily, with an iron hand is carried out in those areas in which its achievements were indisputable and positive – from the social sphere and the education system to defense, technological progress and the maintenance of international peace. In the same spheres in which the Soviet Union was indeed ridiculous and disgusting, the indignation of which caused its collapse, there is not just a tremulous restoration, but also a very sophisticated, energetic and inventive aggravation (Volkov et al., 2017; Bakhshandeh et al, 2015).

Conclusion

Social and political circumstances contribute to the manifestation of social primitivization and simplification in public attitudes, serving as sources of archaization, which is associated with the destruction of the existing cultural layers and the immersion of consciousness in the archaic layers of culture. Social actors in the person of the ruling elites consciously use these intentions to their advantage.

The result is social apathy, disbelief and double thinking. A person loses the original intuition of a positive understanding of sociality, left alone with a loss of sense of meaning and loss of life guidelines, when a person has nothing to relate himself to and nothing to believe in.

Social myth making is closely connected with the manifestations of sacralisation and personification of power in the mass consciousness and value complex. In the space of historically conditioned cultural, religious, national and ethnic traditions there is a complex of values that define a certain idea of power and form an attitude to power as a phenomenon. On the same historical background, the phenomenon of personification of power as a value positions itself.

The drop in educational level, height of ignorance and loss of thrust to knowledge – a clear manifestation of the archaism of the educational practices. We are entering a new educational middle ages. There is a transition to the medieval scheme, but only at a new, *globalist* stage of modern world evolution.

Abstract

The problem of using social networks by students is becoming more and more urgent, as in recent years' virtual communication is increasingly replacing real social contacts, and this is a problem that is little studied by modern researchers. The purpose of the article is to study the types and features of social networks use by students; to consider the Internet as a new communication space for students to communicate; to explore the hierarchy of students' preferences for social media. The leading methods for the study of this problem are the methods of questioning and testing, allowing to do a qualitative analysis of the characteristics of the leading type of students' environmental focus. The article presents a thorough and detailed analysis of social networks' use as a modern communication space. It is revealed that the virtual identity of students consists of such aspects as awareness of various social networks; authorization and use of social networks; presentation of themselves in social networks. The data obtained in the article can be used in social psychology, pedagogy, practical psychology, age psychology, sociology, as well as for the further theoretical development of this issue.

Keywords: students, social networks, virtual identity, communication.

Introduction

The use of the Internet has gained its status of popularity relatively recently and has become one of the most dynamically developing phenomena of modern society. The main function of the Internet associated with access to information, today ceases to be leading. Ability and convenience of communication are the most important aspect of the Internet community nowadays. In recent years, virtual communication is increasingly replacing real social contacts, and this is a problem that is little studied by modern researchers. Active Internet users are students.

The relevance of the study is due to several aspects (Gubanov & Novikov, 2009; Davydov, 2008; Filippova, 2001; Matsubara & Yoshida, 2018). First, this is due to the wide spread in modern society of such type of Internet communities as online social networks, which in addition to the functions of supporting communication, exchange of views and obtaining information by their members in recent years are increasingly becoming objects and means of information management and the arena of information warfare. In the near future, they will inevitably become an essential tool of information influence, including for manipulating the individual, social groups and society as a whole (Devyatko, Shashkin & Davydov, 2010;

Kremleva, 2005; Shikula, 2006; Tastan et al., 2018; Kasteyeva, 2018; Wyrasti et al., 2019). In the second, the study of virtual identity is new in sociology and social psychology. The attention of researchers is drawn to this issue, since the mid-2000s. In the third, important aspect, emphasizing the importance of the chosen topic is the need to study student virtual identity.

When referring to the Internet space, namely to the Internet communities, as the basis of empirical research, the experience of many researchers was used (Novozhenina, 2004; Luchinkina, 2012; Voiskunsky, 2002; Yazdekhasti et al, 2015). Many authors have devoted their works to the study of the World Wide Web (Kramarenko, 2012; Zhichkina & Lukova, 2000; Petrova, 1998; Goryavski, 2001; Friedman, 1999). In their books, these authors analyze the communication through the Internet, and a large place is given to the study of the ways of such communication (email, forums, chat, etc.)

The prospect of information consumption development is the main characteristic feature of the information society. The Internet, nowadays, is moving into a state of one of the main sources of information, both for an adult and for a child. At the present stage of development, the Internet, based on the technological side "is the largest information network formed by combining more than ten thousand five hundred information networks of various types" (Luchinskaya, 2012; Akchurin, 2000; Belyaeva & Cole, 1991; Cole 1991; Cherdymova, 2011; Goroshko, 2010; Maksimović, Vujović & Perišić, 2016; Kariuki & Mbugua, 2018; Vinogradova et al., 2018).

For students living in Russia, in comparison with the book, magazine journalism, television, the Internet is becoming the main source of information, competing with teachers and peers, as well as replacing parents a little. The main reason for the high level of Internet activity of Russian students is the predominance of a positive view of the Internet as a means of access to information, as well as a communication tool. The vast majority (over 90%) of Russian students perceive the Internet primarily through the prism of positive emotions. The emotional attitude of a positive nature is a key reason that encourages the student, forgetting about fatigue, to spend a huge amount of time on the network: to *surf (from surfing)*; there is a figurative analogy with water sports and *swimming on the waves* of the endless Internet), *chat (from chatting), play games, (from Gaming).*

In recent years, the Internet has ceased to be only a technical means, becoming the arena of public and private life. The Internet is a great opportunity not only for access to the necessary information, but also a tool for communication of people on different continents of our planet. The development of the Internet to the possibility of interaction *man-computer* added the possibility of communication *man-computer-man* (Novozhenina, 2004). In this way of communication people communicate with the help of written speech, which distinguishes it as a specific kind of interpersonal relations. One can select the following forms of communication on the Internet: teleconference, chat, MUDs (role-playing game), ICQ (a program that allows you to communicate with the interlocutor one-on-one, in a dialog box), forum, guestbook and correspondence by e-mail. In his work, "Psychology of man on the Internet" A.I. Luchinkina (2012) defines various forms of communication on the Internet and their features.

E - mail- is an analogue of the well-known system of communication through letters sent in envelopes, characterized in that the letter exists in the form of an electronic message that is sent from the sender's computer to the mail server, and then delivered to the recipient's mailbox. Some features characterize e-mail correspondence: communication is interpersonal or group in nature, as well as communication is always mediated and remotely (in the role of intermediaries are the computer and the postal service). Virtual communication, as a way of interaction, can be a monologue or a dialogue, the form of communication can be written and oral, the style of speech can be both official and business, and any other, up to speaking and the use of profanity.

Social network is a complex network formation that combines the features of forums, network communities and ICQ. The primary aim of establishing these networks is search for friends, schoolmates, classmates, acquaintances, work colleagues, etc. Popular resources facebook.com, vkontakte.ru, myspace.com focused primarily on the restoration and maintenance of communicative social relations between people, including the job search, advertising, dating. Internet blog-texts arranged in chronological order, most often focused on expressing their own opinion about any events of both personal and public nature. Internet blogs can be opened for public viewing, as well as for a certain narrow circle of friends who have the opportunity to comment on each other's posts. There is also an opportunity to observe the similarities of Internet-diaries with thematic forums, but in terms of their structure's features (Verchenov, Efremenko & Tischenko, 2013; Zhichkina & Belinskaya, 2010).

Forums-the organization of information exchange and communication between a large number of interlocutors who are interested in the topic of discussion, which is the reason for visiting by these people of a certain virtual space, to bring it to public discussion. The main difference of this type of Internet communication is that in the organization of Internet forums there are no strict restrictions for the contingent of participants, which can be any users, registered on a particular forum. There is also no time limits for discussion of the topic: the process continues as long as the topic is interesting for the interlocutors (Mikhailov & Mikhailov, 2004; Silaeva, 2004; Voiskunsky & Semenov, 2002; Nosov, 1996; Akchurin, 2000; Krylov, 2012). All forums have unwritten rules: discussion of any topic begins with the author's monologue in the form of an article (review, opinion on any of the many positions of interest), which contains the essence of the problem and reasoned arguments of the author in favor of a particular point of view. Further, all interested persons are involved in the discussion with the author. Thus, the method of interaction can be called either a dialogue or a polylogue, if communication is carried out between several participants who can refer to the author or to each other.

Research Methodology

2.1. The Study Methods

In the study process, the method of questionnaire survey was used. This method is a universal method, as it allows solving the following problems:

Based on the analysis of the subject and the goal, we have formulated a number of tasks:

- To study the awareness of social networks
- To explore the hierarchy of social media preferences
- To describe the respondents' attitudes towards social networks
- To describe the reasons for the positive / negative attitude of students to social networks
- To characterize the virtual identity of students in social networks
- To describe the openness of access to the profile of first-year students in social networks
- To describe the system of relations of anonymity / publicity of respondents in the social network
- To identify the frequency of visits and duration of stay in social networks

The study interviewed first-year students. Data analysis was carried out by using the SPSS 17.0 for Windows software package.

2.2. The Stages of the Study

Stage one - development of initial positions based on theoretical analysis of the literature on the subject of research; development of the General concept of research, including methodological principles and the project of development of the research tool.

Stage two - development of a tool to study the virtual identity of students in social networks. The survey method was used to collect empirical data.

Stage 3-empirical research of students' virtual identity in social networks. A sample was formed, empirical data were collected. Preliminary results were obtained.

Stage 4-analysis and interpretation of the results.

Results

Considering the popularity of social networks, it is worth noting that the high awareness of them is not an indicator of the use of the network. Therefore, among the surveyed students, only 10 % are registered in more than six social networks. The majority of respondents (74 %) are registered in 3-5 networks, and 16% of respondents have a personal page in 1-2 social networks. It should be noted that registration in 3-5 social networks is a high indicator of the activity of using networks.

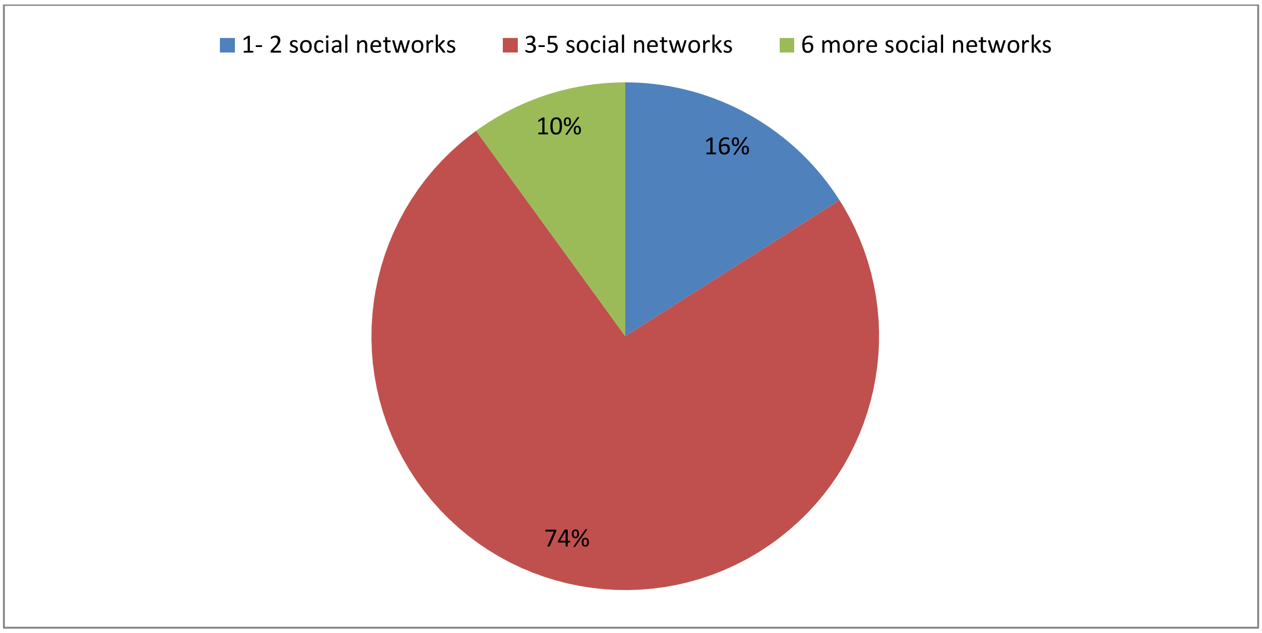

Figure 1. Number of social networks in which students are registered

Analyzing the attitude of first-year students to social networks, the following hierarchy was revealed: in the first place is the social network *Vkontakte* it was noted by 98% of respondents, in the second place *Instagram* network - 38% of respondents, in the third place *Twitter* - 19 %, the last in the hierarchy of preferences is the network *YouTube* - it was noted by 7% of respondents. Any Respondent did not choose the remaining networks.

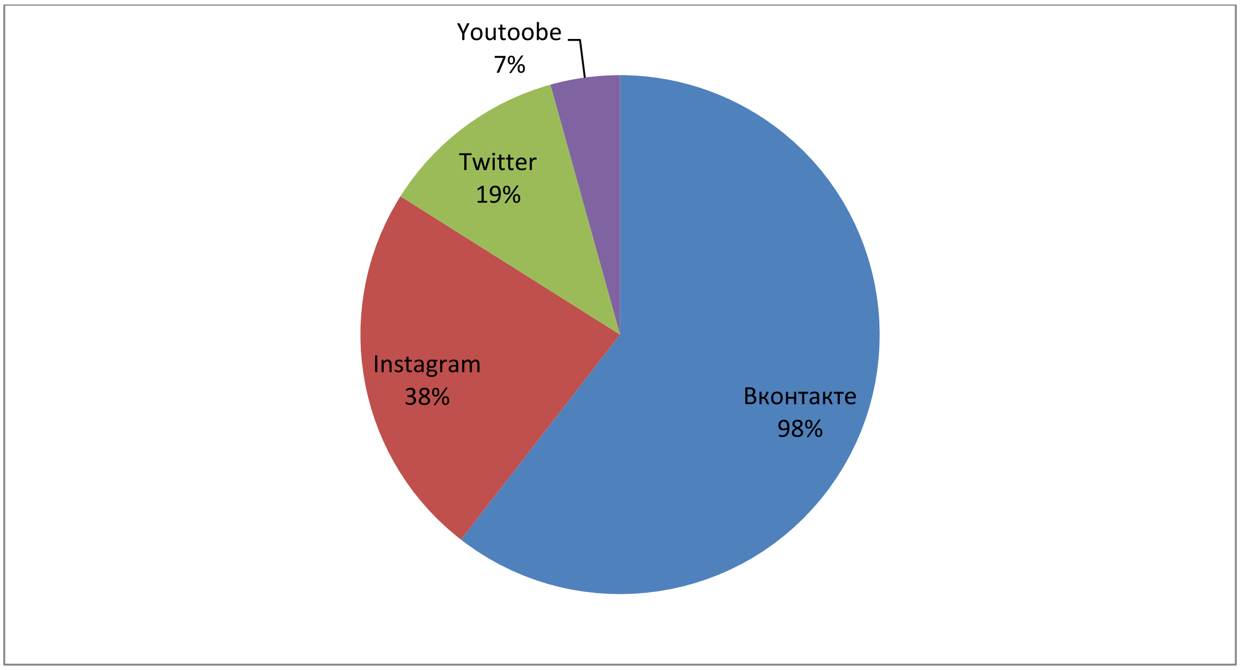

Figure 2. Social networks, which are characterized by a positive attitude

Studying the reasons for the positive attitude to networks, respondents' answers were divided into 2 groups: convenient networks and fashionable networks.

Therefore, students as the most convenient for communication, watching movies/TV series, listening to music, describe *Vkontakte* network. Students also note that in this network there are groups relevant to the study (group, class, school) in which they can exchange information on training activities, jointly preparing for tests, etc. This shows that the social groups become the criterion uniting students. Based on participation/non-participation in such groups, informal virtual social groups are formed.

In turn, most of the respondents described the network Instagram and Twitter as *fashionable, prestigious, cool*. Several respondents indicated that they are registered in these networks only because their idols have accounts in these networks.

When identifying social networks to which students have formed a negative attitude, the following was determined: the most negative attitude of students to the network *Odnoklassniki* 76% and *Moi Mir* 28%. The remaining networks were listed in a statistically small number.

Considering the reasons for the negative attitude to the above-mentioned networks, it should be noted that there is a widespread opinion among students that these networks are designed for a more adult audience. In addition, students find these networks not convenient to use. More than 80% of responses reveal negative attitudes towards networking, the students indicated that the network *Odnoklassniki* and *Moi Mir* - for old people.

We conducted consideration of the virtual identity of students through the study of several features. The first sign was the openness of access to the profile in social networks.

Therefore, among the respondents, 82% of the respondents *Vkontakte* profile has restrictions on access. 72% of the information on the page is open only to *friends and friends of their friends*, and 10% of the information is available *only to friends*. 18% - page is open *for all*. Among the users of social networks *Instagram* and *Twitter* 100% of respondents indicated that access to the profile is fully open. This distribution shows a high degree of openness of access to the profile of students in social networks.

The second sign was the attitude of anonymity / publicity of students in social networks. Consideration of this feature was carried out through the study: the use of real/fictitious name, the use of real photos /pictures.

First, let us look at how students presented themselves in social networks. An interesting result of the study was that 93 % of students in social networks use their real name. Seven % of respondents indicating not their name in the reasons indicated three people (4 %) - "do not want others me to recognize" and 2 people (3%) - "parents do not allow writing my name." Considering the aliases specified by students, it was found that students use the name of the book's hero and the name of their favorite game's hero. Moreover, this distribution is gender-based. Young men noted the name of their favorite game's hero, girls the name of the book's hero respectively.

Despite the high percentage of students providing a real name, the percentage of respondents using a real photo as a profile avatar is much lower. Among the respondents, 60% use a real photo. The remaining 40% of respondents do not use a real photo for two main reasons: "I do not like my photos" (30%) and 8% - "I do not want to be recognized". Speaking about the types of pictures used by students, we note that 25% of respondents on the avatar in social networks use a photo of a famous actor/actress, 10% - a hero of the film, the remaining respondents (5%) - abstract picture".

Discussions

In the relations of the initial age equality, the respondents work out the ways of relationships; pass a special school of social relations.

In their environment, interacting with each other, first-year students learn to reflect on themselves and their peers. Mutual interest, joint comprehension of the surrounding world and each other become self-valuable. Nowadays, the variability of communication between students, both with peers and with other people has increased significantly thanks to the Internet communities. In addition, access to various kinds of information is not just an opportunity; it becomes a way of life. In modern society, the Internet has a significant place in the lives of people, in particular students. Most people associate the Internet with anonymity, ease of access to information, lack of borders and censorship, and security. Nevertheless, the Internet is a reflection of the real world and negative phenomena can be found in its vastness. Students, as a social group, are one of the most active categories of Internet users. As a rule, the main purpose of the user of this social group is communication and virtual contact.

Studying the awareness of first-year students about social networks, it was concluded that they have high level of this phenomenon. 85 % of students know more than six social networks. In identifying the hierarchy of preferences of first-year students in relation to social networks, the following hierarchy was revealed: *Vkontakte* (98 %), *Instagram* (38%), *Twitter* (19 %), *and YouTube* (7%).

Considering the virtual identity of students in social networks, we concluded about the openness of profiles, active use of personal information on personal pages, personal photos. In view of this, we can talk about the presentation of respondents themselves in the network as themselves. *Virtual* identity of students in social networks is equated to *real* identity.

Conclusion

The network has become an intermediary with special properties, and there are *virtual communities* – worlds formed by Internet communication in the network virtual reality. There is a point of view that this Internet space has a certain specificity, due to the psychological and semiotic properties of the Internet as a new culture. Semiotics should be understood as the science of communication systems and signs used in the process of communication.

It is worth noting that there are the following psychological features of Internet culture:

1. The Internet divides the world into one's and other's space, and there are objective prerequisites for the perception of the Internet world and as characterized by openness, independence of the subject and scope for personal growth, and as imposing its own rules, addictive, "sucking the juices of life."

2. The space of the Internet makes it possible to realize the mythological component of the image of the Self: identification with the cultural hero of the Internet – hacker, the implementation of the action of *movement*, *crossing borders*, participation because of the identity of roles within one activity and participation in the *real time.*

3. The Internet stimulates the formation of a *wonderful* picture of the world, performing the function of the periphery in relation to all modern culture, where information about the accidental, new, abnormal, which does not fit into the rigid framework of established ideas, is accumulated.

4. The semiotic space of the Internet, which contains two types of languages, symbolic and iconic, is a medium for generating new texts and new meanings.

Now, there is already quite a large and differentiated community of Internet users, in which, along with random visitors, regular users of certain resources, *Internet workers* stands out and a group of people who are most appropriate to allocate as *Internet residents*. This group of people who have a high enough motivation to stay Online, in particular, spend significant financial and time resources, as well as demonstrate a high emotional involvement in the problems of the Internet. The authors conducted a study in which they identified the features of the emotional and communicative spheres peculiar to people who tend to turn the Internet environment into a space of open communication. As a result, the researchers identified certain psychological features of Internet communication, through which the Internet environment meets the needs of visitors.

First, it should be noted that the Internet provides a unique opportunity to combine communication and auto-communication: texts sent to another, at the same time become available to both the sender and the receiver.

The second feature of Internet communication is a special passion of *Internet residents* to discussions and disputes, which, first, affects the development of self-consciousness.

Another feature of the communicative process on the Internet – the use of *nick* - is the embodiment of the mediating function of the word. As in the technique of double stimulation of pseudo-gradually filled with subject content, so *nick* is a means of generalization of the texts which are marked by it, and after it over time and for interlocutors, and for the author himself begins to appear its subject relevance.

Internet communications have another property that has been repeatedly noted in the literature - anonymity, impersonality. *The border of the personality is the semiotic border*, in this case the border of the personality - *Internet resident* does not include either the physical Self of the person or his properties as the subject of social relations: both physical and social *face* of the person are hidden in the Internet under the mask of anonymity.

It is worth noting that communication has always been and remains organized on the principles of status and asymmetry of the center-province. In any society, the individual accepts these rules as a given: access to communication is possible only through status (position, title, wealth, and name). However, with the development of the Internet, to some critical level, the situation is changing. The role of status is gradually getting smaller. Ideally, the Internet is transforming a culture where communication is possible through status, into a culture where communication is directly accessible online: everyone is accessible to everyone outside of social status. Moreover, not through some highest status of permissiveness, but through the abolition of status as a principle.

Analysis of the communication in the Internet environment also has a number of features. One of the representatives of the specifics of virtual contact is a psycholinguistic kind of features of Internet communication. There are a number of aspects characteristic of this type of specificity of Internet communications: active invasion (inlay) of terms; the use of transliteration and transcription; the use of word-formation and semantic cripples; playing with English words using grammatical forms and norms of the Russian language; the creation of new words based on foreign.

Emotional saturation of communication: it has a compensatory nature in the conditions of almost complete absence of nonverbal means to convey emotions and describe emotional States. It is achieved both with the help of graphic verbal means (the use of capital letters, repetitions of punctuation marks, emoticons, etc.), and special software graphic means sewn into the software shell, for example, *emoticon* (when a graphic image expressing a certain emotion is added to any text message or replica). At the same time, some users prefer to communicate without physical representation (not in video mode). Thus, in this case, a number of communication barriers caused by such characteristics of communication partners, which are expressed in their appearance loses its value: gender, age, social status, external attractiveness or unattractiveness, as well as communicative competence of the person, or rather, non-verbal part of communicative competence. When communicating in Skype mode (i.e. video calls), the emotional component of communication is present in all its manifestations.

Abstract

The effective functioning of the infrastructure is one of the basic conditions for sustainable economic growth, the quality of life of the population, and the strengthening of Russia's defense capability. Rational use of infrastructure bonds will increase the share of private business in the financing of infrastructure projects, increase the investment attractiveness of infrastructure projects. The purpose of the research: to analyze the Russian market of infrastructure bonds aimed at financing or refinancing infrastructure projects in the field of public-private partnerships and concession agreements and to develop recommendations for its further development. In the process of analyzing the Russian infrastructure bond market, limitations were found out that impede the further development of the infrastructure bond market in Russia, and recommendations were made to eliminate the problems of institutional, organizational and economic support for the infrastructure bond market. It is concluded that the infrastructure bond market, as a mechanism for attracting long-term financing in infrastructure projects, is promising for the development and renewal of infrastructure.

Keywords: investments, infrastructure, concession bonds, infrastructure bonds, risks,efficiency.

Introduction

The emergence and development of long-term projects in infrastructure and energy is an indicator of trust to the economy, to its stability. It is known that the growth of investments in infrastructure in the future creates new jobs, stimulates economic growth, helps reduce transport costs and improve the standard of living of the population. The quality and level of infrastructure coverage determines the vector of development of all Russian industries and is one of the main factors for improving competitiveness and integration into the world economy as a whole. At present, the financial market allows attracting large-scale and long-term investments in infrastructure projects.

The rapid development of the domestic corporate bond market in 2017 led to the continuation of the trend of partial replacement of loans with bonds, but the bulk of investment in infrastructure projects is still formed through loans. The current state of the Russian capital market is characterized by: a low level of capitalization of the stock market, a low ratio of the volume of bonded debt to GDP, high entry barriers for medium-sized companies, a weak development of the securitization market and project financing instruments. Under the conditions of limited investment resources for financing infrastructure facilities, when classical forms of financing are not available or not profitable, the question of finding alternative sources of financing becomes relevant. One of these sources is infrastructure bonds. However, it should be noted that. The discussion of interpretations of the concept of “infrastructure bond”, the lack of a unified scientifically based approach to the financing of infrastructure projects through the issuance of infrastructure securities also actualize the problem.

Problem Statement

The search for possible sources and instruments for attracting long-term money to finance Russian infrastructure projects, the demand for and availability of these sources and instruments in the Russian financial market, mechanisms for encouraging long-term investments requires finding new and improving infrastructure financing tools used. The objective of the study is to show that under conditions of limited investment resources for financing infrastructure projects operating under a public-private partnership (PPP) agreement, a concession agreement, the use of infrastructure securities is a flexible tool that allows you to reduce market risk, the risk of inflation.

2.1. Research Questions

The methodology of the study supposes consideration of the following questions:

– find out trends in the development of the modern Russian infrastructure bond market;

– make an analysis of the institutional and organizational-economic problems of the infrastructure bond market and propose measures to overcome them;

– to consider foreign experience in the use of infrastructure bonds from the standpoint of the transformation of "best practices" into the Russian economy;

– develop a model to determine the boundaries of changes in the yield of the infrastructure bond, depending on the preferences of the institutional investor and the effectiveness of the infrastructure project.

The purpose of the study is to find out the main trends of the Russian infrastructure bond market in the context of limited investment resources for financing infrastructure facilities and to make recommendations for its further development.

2.2. Research Methods

The goal was achieved by analysing the analytical and statistical materials of the Central Bank of Russia, the Ministry of Economic Development, the Ministry of Finance of the Russian Federation, Rosstat, the Organization for Economic Cooperation and Development (OECD), the agencies Bloomberg and Rusbusiness-consulting, the Russian and international business press, which contributed to complex and objective conclusions.

Results and Discussion

The world has accumulated significant experience in issuing infrastructure bonds. Issues of such bonds are made in the USA, Australia, South Korea, Canada, Kazakhstan and other countries, where they are represented as municipal bonds and corporate infrastructure bonds. The concept of "infrastructure bond" first appeared in Europe, at the beginning of the 21st century, when European countries, faced the problem of updating and developing social infrastructure. They created mechanisms of supporting and raicing the rating of bonds used to finance infrastructure projects and developed new products for institutional investors. promoting private investment. One of such tools was the "infrastructure bond". In Russia, the necessity in bond financing of infrastructure projects has arisen due to the limited ability to attract both public and private funds. Currently, several definitions of bonds are used to finance infrastructure projects: infrastructure bonds, concession bonds, project bonds, as well as on the initiative of the Central Bank, concession bonds are developed for individuals (Ermolovskaya, Telegina & Golovetsky, 2018)

However, at the legislative level, these terms are not fixed (the draft law "On the specifics of investing in infrastructure using infrastructure bonds" was not adopted). Therefore, infrastructure bonds in Russia are not a separate type of assets, but have a business case without a legal basis. Legislative definition in Russia has only the term "bond" (Federal Law "On the stocks and bonds market").

The class of infrastructure securities in Russia includes concession bonds (bonds) and bonds issued by special project financing companies (further referred to as SPF) to finance infrastructure projects. The main advantage of SPF-bonds is that in case of default the holders of these bonds have more rights than the shareholders. The market has not shown any interest in the soft-currency bonds, so there has not yet been a single issue of these securities. One of the reasons why SPF bonds did not find practical implementation is that market participants could not reach a consensus on whether SPF may be a concessionaire (Larionova et al., 2018)

The concept of "concession bonds" also did not receive a legislative justification, but it was economically justified in 2013 by an order of the Federal Financial Markets Service (FFMS of Russia), as well as in 2017 provisions of the Central Bank of Russia (580-P and 534-P). In the above documents, bonds issued for financing the concession project were allocated to a separate class and received the right to be included in quotation lists of the first and second levels on the Moscow Stock Exchange, and the Central Bank included some issues in its Lombard list.

The issues of concession bonds first appeared in 2010 for transport projects. The minimum volume of issue of concession bonds is fixed at 1 billion rubles, and the maximum at 8.5 billion rubles. Placement of almost all concession bonds, except for two issues, was carried out at face value.

Later issues of concession bonds were, in addition to transport projects (63%), also directed to the social sphere (16%), communal facilities for waste recycling (21%) and others. At the same time, 54% of all funds from the issues of concession bonds were spent on financing infrastructure facilities of the Federal level, 46% on projects at the regional level (Yakunina & Galaktionova, 2017).

Concession bonds are often identified with project infrastructure bonds, which, unlike them, are not separated into an independent class of securities, and the common thing between them is only that the issuer is SPV.

In practice, in order to increase the attractiveness of securities for an investor, an infrastructure bond is called all bonds aimed at financing an infrastructure project. At the same time, if the bonds are not tied to a specific project, the funds raised through their issues can be spent not only on the creation of infrastructure. The peculiarity of such bonds is that they are not issued by SPV, but by the company itself; therefore, they do not have bonuses of concession and other infrastructure types of bonds.

It should be noted that the infrastructure and traditional bonds have a common nature of occurrence and are based on the traditional principles of credit relations (payment, repayment, urgency), which is reflected in their classification.

The main differences between infrastructure bonds and corporate bonds are as follows:

– the issuer of infrastructure bonds is directly a private partner (concessionaire);

– as a rule, a private entity is a specially created project company (SPV or special purpose vehicle), which is engaged in activities related to the project and is not a professional participant in the securities market);

– investments to bondholders are returned by the issuer from the cash flow generated by the project:

– target nature of use;

– long circulation period (circulation period ranges from 10 to 49 years, the average period is 17 years);

– specifics of security (concession bonds can be provided in some cases with direct state guarantees, and holders of securities have a priority when paying off debt to the shareholders of the concession company);

– specific project participants (insurance companies, non-state pension funds);

– predictability of cash receipts depending on the content of the concession agreement and, as a result, low dependence on the state of the securities market;

– setting a floating rate of coupon income, which, as a rule, is tied to the consumer price index, inflation, the key rate of Russia or other indicators.

Infrastructure bonds in practice have proven to be an effective tool for raising funds for the implementation of infrastructure projects in Russia. According to the InfraOne analytical review, the demand for concession bonds exceeds their volume in circulation by almost four times. This amounts to 17-20% of the total amount of funds available for financing the country's infrastructure (in absolute terms - 380-400 billion rubles) (Malinovskaya, Sapko & Brovkina, 2016)

In 2017, the market volume of concession bonds increased almost 9 times, and there are 22 issues of concession bonds in the amount of 75.046 billion rubles. These funds were attracted by 10 issuers to finance 13 projects. In the next two years, pension funds, as the main consumers of concession bonds, can invest in them about 10-15 billion rubles (Lower-Basch, 2014).

In the near future, a significant growth of the concession bonds market is predicted in Russia. However, at present the share of this market remains insignificant and amounts to 2.3% of corporate securities (75 billion rubles) (Bogoviz, Chernukhina & Mezhova, 2018)

A small amount of concession bonds in circulation is explained, on the one hand, by the lack of projects on the market, and on the other hand, by the fact that investment-attractive infrastructure projects are usually immediately structured for loan financing.

Table 1. Plan for entering the market in the years 2018-2020

Nr	Issue	Series Class	Project	Volume, billions of rubles	Maturity, years
1	North-West Concession Company	0,1 0,2	Section of the highway M-11 "Moscow - St. Petersburg", 15-58 km	5 5	20 20
2	"Waste Management"	BO-02	System for recycling and disposal of solid waste in the Murmansk region	1,75	12,5
3	TEC "Kyzyl-Kuragino"	-	Construction of the railway line Kyzyl - Kuragino (410 km) to the Elelegest coal deposit	134,6	15

Participants of the Russian market, in turn, explain such dynamics in the infrastructure bond market by the presence of problems of both institutional and organizational-economic nature, which impede the further development of the infrastructure bond market in Russia.

From an institutional point of view, the following main problems can be identified:

– the lack of legislative consolidation of the term "infrastructure bond";

– the limited goals and scope of the SPV;

– the lack of special conditions for the inclusion of infrastructure bonds in the Lombard List of the Bank (Esty, 2009).

– there are no requirements for disclosing information on the issue of infrastructure bonds during the operation phase of the infrastructure facility;

Organizational - economic problems are:

– lack of a unified standardized procedure for issuing infrastructure bonds;

– high capital intensity and duration of many infrastructure projects, which reduces the interest of a private investor

– imperfection of tax regulation;

– current market conditions (ineffective interest (coupon) rates, liquidity crisis);

– The existing procedure for assigning ratings to concession bonds.

At present, regulators and market participants are addressing the issue of assigning a rating to concession bonds prior to their release. Such a change will allow interested financial institutions to plan in advance the purchase of concession bonds and increase the circle of investors (Maslennikov, Fedotova & Sorokin, 2017)

The key problem of issuing infrastructure bonds is to determine the level of return that is comfortable for both the issuer and the investor. The practice of issuing infrastructure bonds in Russia shows that the yield on concession bonds is determined by the formula "inflation +%". The position of the Central Bank of the Russian Federation on this issue is as follows: the fact of concluding a concession agreement allows the concessionaire to be considered a serious borrower, based on this, the yield on infrastructure bonds should be lower than the average yield on a bank deposit and higher than the average annual inflation rate (Korovin, 2015).

Thus, the specificity of this instrument determines the yield of concession bonds below the yield of corporate bonds and above the yield of government bonds.

Taking into account the inflation rate for the first quarter of 2017, the average yield of concession bonds was about 2%. At the same time, the average yield of project bonds for the same period was 7%.

In 2018 the average coupon rate of the current yield of concession bonds was 9.42%, and the weighted average - 9.46%. With a large spread of interest rates (from 4% to 16.9%), the real profitability of the investor in almost all issues of concession bonds ranges from 2.5 to 4% per annum.

The relatively low profitability of infrastructure bonds contributes to a decrease in the investment attractiveness of the instrument. Given period of circulation of the infrastructure bond and the possible risks of the implementation of the infrastructure project, the institutional investor will prefer to invest in a bank deposit (Hojati et al, 2014).

The question of determining the optimal yield of the bond issue has been studied by many Russian scientists.

Thus, according to A. Ivanter (2017), setting the coupon rate according to the "inflation plus" formula reduces the relationship between the cash flow generated by the concessionaire and payments on bonds. This circumstance increases the risk of default on such securities. According to T.S. Shadiyeva (2016), it is not inflation, but the demand for infrastructure facilities and the solvency of the Russian population that have a significant impact on the profitability of concession bonds. Thus, the percentage of motorists who refuse to use infrastructure facilities due to an increase in tariffs in Russia reaches 40%.

According to the authors, it is possible to model both the lower and upper boundaries of the yield of an infrastructure bond. The existing practice of determining the yield of an infrastructure bond is supposed to be used as the lower limit. In this case, the lower limit of the yield of the infrastructure bond is defined either as "inflation +" or as "CPI (Consumer Price Index) +."

It is recommended to use the indicator of the internal rate of return (IRR) as the upper limit of the yield of an infrastructure bond.

This approach will allow us to more accurately predict the yield of a concession bond depending on the performance indicators of the infrastructure project and can be used by institutional investors in managing a portfolio of securities and determining portfolio returns.

The proposed method involves the phased modeling of infrastructure bond yields.

At the first stage, the effectiveness of the infrastructure project (NPV project) is determined. When evaluating an infrastructure project financed exclusively from the budget, it is advisable to use the discount rate calculated by the formula as the discount rate:

$$r = r(f) \pm r(k) + r(c) + k \qquad (1)$$

Where:

r is the discount rate for infrastructure projects;

r (f) is the risk-free rate determined by the median yield for the corresponding period;

r (k) is the corrective rate, i.e. interest rate oriented behaviour of euro paper on the time horizon after the median;

r (c) is the country risk rate;

k is a corrective annual coefficient depending on the level of inflation in the country.

As a risk-free return, it is advisable to use the yield on government bonds RUS-30 (Russia-2030)

When calculating the discount rate for PPP projects, instead of the RUS-30 index indicator, as a risk-free return, the indicator of the annual bonds of infrastructure bonds is used. The calculation of this indicator is difficult, because insufficient statistics has been accumulated for an analytical substantiation of the rate in the inter-annual interval; therefore, in order to unify the calculation of the discount rate for an infrastructure project operating under the PPP and concession agreement, it is recommended to use the weighted average cost of capital (hereinafter WACC) (Ahmed & Aziz, 2018).

As a WACC, it is proposed to use the declared return on infrastructure bonds. When calculating flows from operating and investment activities, it is recommended to use the scenario approach.

If the profitability of the infrastructure project is greater than or equal to the average profitability of the bank deposit for the current period, then the lower limit of the profitability of the infrastructure bond is subject to adjustment and is set at the level of the average profitability of the deposit. Upon reaching this mark, it is implied that the yield of the infrastructure bond is set at an optimal level (Authers, 2015).

What are the advantages of the proposed calculation approach:

– the investment attractiveness of concession bonds increases, since the yield calculated by this method is higher than the yield of government debt securities;

– a relationship is established between the performance indicators of a specific infrastructure project and the yield of infrastructure bonds issued for its implementation;

– there is an incentive to reduce the capital intensity of the infrastructure project;

– the lower limit of the yield of the infrastructure bond will provide investors with a minimum income (taking inflation into account) even with an unfavorable option of implementing the infrastructure facility.

In order to develop the Russian market of infrastructure bonds, it is advisable to study and adopt the accumulated positive foreign experience. Abroad infrastructure bonds are issued at the stage of operation of the infrastructure facility, when the project independently generates a stable cash flow, which is the source of payments. This is what determines the high reliability of infrastructure bonds and, as a result, their attractiveness to conservative investors. Conservative investors do not accept the risks associated with the rising cost of construction. In Russia, project companies are forced to finance the construction phase of infrastructure projects at their own expense, including through the issuance of infrastructure bonds. Increasing the risk for an institutional investor affects the growth of interest income on infrastructure bonds (Shubaeva & Kharchenko, 2016; Metsämuuronen, 2018).

The analysis of foreign practice shows that in the development of the infrastructure bond market a significant role is assigned to state regulation.

Abroad, the state stimulates the development of the infrastructure bond market with various forms of state support for issues, namely:

– issues monetary subsidies (the state transfers a sum of money for the project implementation);

– guarantees payment (the state accepts the obligations of the buyer in relation to a private person in the absence of market demand for a service or product);

– guarantees revenue (the state guarantees the minimum income of the project being implemented);

– guarantees the repayment of the debt (the state guarantees the payment of money to creditors (bondholders) in the event of an issuer default;

– guarantees the estimated cost of construction (the state protects the private investor from the potential excess of the cost of the project at the stage of its construction).

Russia also uses forms of state support for issues similar to those in the world, for example, guaranteed payment and a guarantee of revenue. However, for purposes of assessing risks and the quality of debt service, it is advisable to take into account other forms of security for obligations on bonds as well as state and municipal guarantees.

In order to unify the methodology for project evaluation, it is considered expedient to apply the European Union's experience in supporting project bonds 2020. Adapting the European experience will help maintain the rating of the infrastructure bond issued by the concessionaire at a constant level (for the duration of the loan or the guarantee period) (Joseph, 2013; Fathi & Dastoori, 2014).

Conclusions and Recommendations

In conditions of the budget deficit, sanctioning of the Russian economy from Western countries, legislative tightening of infrastructure projects (introduction of Basel III standard), limited stock market for finance infrastructure projects, infrastructure bonds as a tool for attracting long-term financing is promising for the development and renewal of infrastructure.

Opportunities for structuring loans, choosing a source of redemption of bonds, determining key terms of issue, developing a mechanism for distributing income and project risks allow the use of infrastructure bonds to finance any infrastructure project.

Analysis of existing issues of infrastructure bonds showed that the infrastructure bond market in Russia is not sufficiently developed.

The infrastructure bond market is characterized by a disproportionate fundraising for federal and regional projects.

An analysis of the institutional and organizational-economic support of the infrastructure bond market has made it possible to identify a number of limitations that impede the further development of the infrastructure bond market in Russia.

An analysis of foreign experience in using infrastructure bonds shows that those countries (Chile, Peru, Brazil) achieved the greatest development in financing infrastructure facilities using infrastructure bonds in which pension systems were reformed at the end of the 20th century and restrictions on investing pension funds in infrastructure were lifted.

The existing model for determining the yield of infrastructure bonds, depending on the rate of inflation, the consumer price index does not meet the expectations of an institutional investor.
A number of articles of Federal Law No. 39-ФЗ "On the On the stocks and bonds market" dated April 22, 1996, instructions of the Central Bank of the Russian Federation, regarding the inclusion of infrastructure bonds in the Lombard List of the Bank of Russia, establishing a uniform procedure for information disclosure by issuers of infrastructure bonds require further improvement.
It is advisable to create a specialized platform on the MICEX where infrastructure bonds will circulate, which will help create an institutionalized market for infrastructure bonds, as well as facilitate the process of investment in infrastructure projects by insurance companies and pension funds.
For the further development of the infrastructure bond market, there is an objective need to approve a uniform methodology for issuing infrastructure bonds for both financing and refinancing infrastructure projects, which will simplify and make the process of issuing infrastructure bonds more "transparent".
To remove economic constraints, it is necessary to consider reducing tax payments for concessionaires issuing infrastructure bonds. The use of the TIF mechanism in Russia (the mechanism for encouraging investment in infrastructure due to the increase in the tax base from operating the infrastructure facility) will allow the public side to more effectively finance infrastructure facilities and may become a promising direction for the development of state object private partnerships.

Confrontation Between Traditional Islam in Russia and Islamic Trends Abroad is Inevitable

Abstract

The article examines the conditions under which Russian Islam was formed, with its tolerance of the secular state power structures and its tolerance of the world perception and way of life of other ethnic groups and peoples. It demonstrates that the ideology of hostility, intolerance and militancy with regard to dissent characteristic of many trends of Islam outside Russia force them to be in permanent confrontation with all the other trends in Islam, including the Islam traditional for Russia. This contradiction inevitably destabilizes the political and socio-economic situation in the country. For example, Wahhabism which arose as the religious trend spearheading the national-liberation movement of some Arab tribes against Turkish rule, contradicts in its forms, methods of self-assertion and activity, the fundamental principles of tolerance of other faiths which Russian Islam has traditionally followed. For Russian Islam traces its origin to the early Muslims, the followers of the Prophet Muhammad and the Prophet Himself and is clearly set forth in the Koran and Hadith.

Keywords: Monotheism, traditional Islam, religious tolerance, Koran, Hadith, Torah, the New Testament, foreign Islam trends.

Introduction

Statement of the Problem

The problem of religious existence of modern mankind is undoubtedly one of the most urgent for all states on all the continents. Hardly a day passes without the mass media bringing alarming reports from all corners of the earth about terrorist attacks or detention of religious extremists and terrorists. We have shown in many of our previous works that humanity has in its development entered a fundamentally new era when many ethnic groups and peoples, losing their religious perception of the world under the pressure of scientific and technological progress adopt scientific cognition of the world and life activities based on this perception. Predictably, two civilizational mentalities within the same ethnic entities clash just like at the beginning of the first millennium and up until today ethnic entities and peoples who have matured to adopt monotheism have been switching from the pagan perception of the world (polytheism) to monotheism (Oganesyan, 2018; Oganesyan, 2015).

Powerful integration and migration processes which have spread their influence to all the ethnic entities and peoples in the world community have dragged into the maelstrom of worldview passions and clashes many countries including Russia which has over millennia been inhabited by ethnic entities of different mental civilizational levels.

It has to be stressed that we identify three stages of mental civilizational development of humankind: paganism, monotheism and the scientific perception of the world which the world's countries and peoples started to adopt beginning from the epochs of Enlightenment and Reformation in Europe (Oganesyan, 2018; Oganesyan, 2015; Mollaei et al, 2014).

The Goal of the Study

The purport of this article is to show that Islam as traditionally preached by ethnic entities in Russia has nothing in common with the "foreign Islamic trends" in terms of the forms and methods of its existence, its activity and interaction with the secular state as well as with other religions and beliefs existing in the country. Therefore traditional Russian Islam comes under serious pressure on the part of "foreign" Islamic trends which became widespread in the country during the period of disintegration of the Soviet Union, the pressure sometimes taking the form of physical elimination of the spiritual leaders of Muslims who espouse peaceful coexistence with other religions and religious trends traditional for our country (Ameen et al., 2018; saif & Abbas, 2018).

Research Methods

The article uses methods that are traditional for humanities studies. In particular, gathering and analysis of specialized literature on the theme. Gathering and analysis of historical sources on the topic of study. Analysis of statistical data on the number of Muslim religious organizations in the Russian Empire and the USSR. Comparative analysis of monotheistic Scriptures such as the Torah, the New Testament and the Koran which the Koran considers to be the three Messages from the One God to humanity.

Research Issues

The Islam traditional for Russia is known to be the Islam that most fully corresponds to the teaching of the Koran (2008) and the Sunna. The Islam which in terms of its peaceful nature, mercy and particular religious tolerance was characteristic of the early Muslims who were contemporaries of the great Prophet and Messenger of the One God, Muhammad, the Islam that was adopted by the ethnic entities of the Russian state from its followers.

However, it is no secret that each of the trends in Islam that arose earlier and exist today considers itself to be the "purest", most correct and righteous both in terms of interpretation of specific tenets of faith and the rituals of worshiping the Almighty. The reader at all familiar with the history of the existence of religions knows that Islam is no exception in that respect. No monotheistic religion in its historical development has avoided being splintered into many conflicting trends. This is characteristic for Judaism and Christianity. Unlike monotheism, paganism, for example, which has a rigorous family and tribal basis, has immutable norms and rules and customs of worshiping gods passed on from generation to generation in accordance with a strictly established procedure (Oganesyan, 2018; Oganesyan, 2015; Zare & Rajaeepur, 2013).

It is also known that many Muslims in Russia believe, not without reason, that they are following traditional Islam that was preached by Muhammad (Khaidarov, 2010).

There are of course other points of view which claim that all trends in Islam have the right to exist, like in other world religions. For it is only the Almighty who can decide which religious trend is true and which is false. They support their claims by citing the Koran and the Prophet's Hadith.

Thus the Koran writes: "Indeed, those who have divided their religion and become sects – you (Oh, Muhammad!) are not (associated) with them in anything. Their affair is only left to Allah, then He will inform them about what they used to do. Whoever comes… with a good deed will have ten times the like thereof [to his credit] and whoever comes with an evil deed will not be recompensed except the like thereof; and they will not be wronged" (Surah 6:159-160) (The Koran, 2008).

In an often-quoted passage the Prophet Muhammad warned his followers that if "the Jews divided themselves into 71 trends and Christians in 72, my community will be divided into 73 trends." However, he also warned Muslims that all of them would be "in fire except one." When his followers asked him who will be spared fire, the Messenger of Allah replied: "I and my followers" (Hadith on the Muslim community dividing into 73 trends, 2010).

Thus in the minds of the Muslim umma (community) of Russia, and of the whole post-Soviet space the traditional path is thought to be the one followed by the Prophet Muhammad and his co-religionists, that is, the path of "Tradition and Concord." (Khaidarov, 2010)

It is the accepted view that the time of actualization of the concept of traditional Islam in our country did not coincide with the start of the breakup of the Soviet Union by chance when the previously "totally atheistic" population of the country began to revert en masse to religious consciousness (Khaidarov, 2010).

Without going into an analysis of the religious situation in the post-Soviet space during the period of the disintegration of the Soviet Union, let us note that in 1991-1992 the former union republics saw not only an avalanche-like dissociation of religious organizations, notably Muslim councils (Trans-Caucasus Muslim Councils — Wikipedia, 2019) but also the emergence of new religious organizations. They belonged to various trends not only in Islam, but also in Christianity and in paganism because a flood of "spiritual teachers and mentors" of various persuasions inundated the country. Christian, Islamic, Judaist and Vedic pagan missionaries began to preach views that are alien to our ethnic entities but also flooded the country with religious literature, including overtly extremist literature.

While Christian and pagan missionaries preferred to work with flocks inside Russia creating religious seminaries and schools in specially acquired or rented buildings, the leading Islamic universities of the world also flung open their doors for young men and women who decided to preach Islam. Examples are the International Islamic University in Malaysia, Al-Azhar University in Cairo, Imam Saud University in El-Riyadh, Medina Islamic University in Saudi Arabia, International Islamic University of Islamabad and so on.

It is no secret that the organization of the teaching process in Islamic universities in the Middle East was superior to that of theological establishments in the Soviet Union. It had become fashionable and prestigious to acquire a theological education abroad. All the more so since as a rule it was free or was provided at a symbolic cost (due to financial support of foreign foundations and sponsors).

However, when they returned home the graduates of foreign theological education establishments typically began to preach not the Islam that was traditionally preached in Russia, with its tolerance of the authorities, other religions and denominations, but an openly radical Islam hostile and aggressive with regard to any other perception of the world.

This is not accidental because Islam in many countries of the world (this needs to be stressed) was formed and existed in conditions that were totally different from those in the Russian Empire and later in the Soviet Union.

The Russian Empire, which considered it self to be an Orthodox power nevertheless did not permit itself to meddle in the religious affairs of the numerous peoples inhabiting the Empire in its vast spaces and in their traditions and customs.

Let us cite but one eloquent example. The need to consolidate political power in the hands of the sovereign forced Peter I to introduce state control over the Orthodox Church which was considered to be the ideological and intellectual bulwark of the Russian Empire. Thus in 1721 Peter I established a Spiritual College later renamed the Holy Governing Synod) under his own patronage. Two years later (in 1773) the Synod issued a decree proclaiming religious tolerance and religious peace in the state: it was called "On the Tolerance of All Religions and on Forbidding All Archbishops to Be Engaged in Affairs Concerning Other Faiths and the Building of Prayer Houses According to Their Laws Leaving it to Secular Administrtions" (Decree of the Synod on Tolerance of All Religions – Russian, 2019).

Under the Decree, Muslims and Buddhists, among others, were not only granted total freedom to build mosques and datsans, but also to set up religious schools. Moreover, the Muslim mullahs and the Buddhist lamas were paid out of the State Treasury allowances that were often bigger than those allocated to Orthodox clergy.

All the other autocrats of the Russian Empire followed Peter the Great's religious policy. It is not by chance that in 1788 a Muslim community of the European Russia and Siberia was established, called the Orenburg Muhammadan Spiritual Assembly with its center in Ufa. The statute of the Assembly approved in 1789, combined the principle of appointed mufti and the principle of election of three Sharia judges (*kaziys*) from amongst ulema in the Kazan Gubernia. This made it possible to harmoniously combine the interests of imperial power and the Muslim umma (Khabutdinov, 2010).

The Tavrichansky Muhammadan Council was set up in Simpheropol in 1831 and spiritual Councils of the Sunnis and Shiites of Transcaucasia were established in Tiflis in 1872 (Khabutdinov, 2010).

It is very important that all the religious "councils" were based on the principles of non-interference of secular authorities in the internal affairs of religious organizations and of allowing them to act in accordance with their religious convictions (Khabutdinov, 2010).

The Muslim umma in Russia, given non-interference in its internal religious affairs, in the relations with the representatives of Christian and Judaist communities was guided by the prescription of the Koran to treat them as equals and not to be in conflict with them so as not to provoke enmity and hostility toward and hatred of itself. "And do not argue with the People of the Scripture except in a way that is best, except for those who commit injustice among them, and say 'We believe in that which has been revealed to us and revealed to you. And our God and your God is one; and we are Muslims [in submission] to Him." (Surah 29: 46) (The Koran, 2008)

Incidentally, the Koran demanded a more tolerant attitude to pagans than did the Torah and the New Testament: "If it had been Allah's plan, they would not have taken false gods; but we made you not one to watch over their doings, nor are you over them to dispose of their affairs. Do not revile those whom they invoke other than Allah because they will revile Allah in ignorance out of spite" (Surah 6:108) (The Koran, 2008).

Thus, over the centuries a type of Islam was formed in the Russian Empire which, first, had the loyalty of the country's secular authorities. Second, the Muslim umma was itself loyal to the state. Third, the Muslim umma was tolerant of all the other religions. Fourth, other religious communities were tolerant of the country's Muslim umma.

Of course, I am referring to official relationships among religions in the country. As for the actual attitude to other religions within each religious community, it was often negative.

Nevertheless, the Muslim communities of the Russian Empire, unlike the overwhelming majority of Muslims outside Russia, did not seek to uphold their religious identity and state sovereignty through bloody clashes with the "close and distant" ethnic entities and peoples, state regimes and countries. All the religions in the Russian Empire, including the Shiites and the Sunnis, coexisted peacefully under its powerful protection and patronage.

Beginning from 1917 the Soviet government separated all religious organizations from the state. However, it did not forbid people to conduct their religious observances (History of the Constitutions of the USSR and RSFSR, 2019).

For example, the 1925 Constitution of the RSFSR recognized citizens' rights to freedom of anti-religious propaganda and religious preaching. The RSFSR Constitution of 1929 proclaimed that "all citizens have freedom of religious worship and freedom of anti-religious propaganda" (History of the Constitutions of the USSR and RSFSR, 2019) That provision was sealed in the USSR Constitution of 1936 and later in the USSR Constitution of 1977 (History of the Constitutions of the USSR and RSFSR, 2019).

Moreover, Article 52 of the USSR Constitution of 1977 and Article 50 of the RSFSR Constitution of 1978 granted the citizens the right "to preach any religion or not to preach any religion" (History of the Constitutions of the USSR and RSFSR, 2019).

Under Article 28 of the current Constitution of the Russian Federation (2019), like many other Constitutions of the vast majority of the world's countries, every citizen is "guaranteed freedom of conscience, freedom of religion, including the right to preach individually or together with others any religion or not to preach any religion, to freely choose, follow and spread religious and other convictions and act in accordance therewith" (Constitution, 2019).

Clearly, unlike the truly merciful and tolerant "traditional Islam" that took shape in the boundless spaces of the Russian Empire and then in the Soviet Union, Soviet citizens who studied at religious educational establishments abroad, were exposed to a very different kind of Islam.

Many Middle East countries where Islam is prevalent, after Muhammad's prophetic mission, were constantly faced with complicated tasks, first, connected not only with internal political conditions (for example, feudal and clan quarrels). And second, with external threats from other states.

Fierce confrontation, bloody wars over state, economic and religious issues were permanent features of the countries of the Middle East and South East Asia. Understandably and logically, each of the opposing sides invoked not only the spiritual mentors of their people, but tried to find vulnerable spots in the interpretation of faith by their opponents. The search for the tiniest flaws in interpretations of various religious tenets and in the rituals of worship willingly or unwillingly created a new trend in Islam and made it intolerant of and aggressive toward all the other religious trends considered to be "infidels" and "impure." Besides, because monotheistic religions, owing to their historic mission, claimed universal recognition and world influence from the start, each ruler deemed it his sacred duty to spread it all over the world. All the more so because the Koran, like the New Testament in its time, prescribed believers to spread the faith in the One God among all the peoples of the world (Matthew 28:19-20) (The Bible, 1995).

The answer to the question why monotheism claimed world dominance and sought to conquer the whole world lies in the historic mission of monotheism (Oganesyan, 2015; Oganesyan, 2018).

It is well known that the One God, unlike the "home" gods of the pagans, first appeared to the sons of Israel and then through Jesus Christ and Muhammad to all the other peoples of the world as the one and only God who created not only the Earth and Man, but the whole Universe. He presented himself as the sole ruler and sole Law giver, the Supreme and Ultimate Judge of all the earthly and extraterrestrial worlds Who determined and bequeathed through his prophets and messengers and norms and rules of life as well as the concepts of good and evil, sin and righteousness. He presented himself as an impartial, immutable and eternal God of all people and all nations on Earth not perceived by any human senses. It was He, according to the Torah, the New Testament and the Koran, who showed all the peoples the strategic path of their development on Earth and the inevitable transition to a life "in Heaven close to their Creator" (Oganesyan, 2015; Oganesyan, 2018).

Let us recall the words of the Torah addressed to the sons of Israel: "I am the one, and there is no God like Me! I cause death and grant life. I strike but I heal and no one can rescue from my hand (Devarim 32, Haazinu, 39) (The Torah, 1993).

We may recall the instruction of Jesus Christ to His apostles and disciples before His Ascension: "Go therefore and make disciples of all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost teaching them to observe all" (Matthew, 28:19-20) (The Bible, 1996).

It would be appropriate to recall the words of the first (opening) Surah of the Koran: "In the name of Allah, the Entirely Merciful, the Especially Merciful. All praise is due to Allah, Lord of the Worlds. The Entirely Merciful, the Especially Merciful, sovereign of the Day of Recompense. It is You we worship and You we ask for help. Guide us to the straight path, the path of those upon whom You have bestowed favor, not of those who have evoked [Your] anger or of those who are astray (Surah 1: 1-7) (The Koran, 2008).

Hence it is natural that, first, the bulk of our country's population which is still at the mental stage of monotheism, rejects the values that are alien to its civilizational level, the so-called Western values. Second, "foreign" Islam with its call for building a state of social justice based on Divine Commandments, laws, and principles is finding zealous apologists and adherents in our country which is being corroded from within by appalling social inequalities, corruption, embezzlement and total moral degradation.

The character of the kind of Islam that is alien to the peoples of Russia is apparent in the emergence of Wahhabism in Central Arabia and its subsequent spread to various corners of the modern world, including the post-Soviet space (Wahhabism, 2019).

Wahhabism (2019), which sprang up in the 18th century, set as its main goal the liberation of the Arab tribes of Central Arabia from the Turkish rule, i.e. it envisaged a liberation war from its inception. Because the Ottoman Empire which had enslaved numerous Arab tribes had Islam as its official religion, the ideologist of the national-liberation movement, Muhammad al-Wahhab, a clergyman, found a simple and understandable slogan that would unite the majority of Arabs in the struggle against the Ottoman caliphate, the slogan of "cleansing" Islam of Turkish accretions and a "return" to the order of the times of the Prophet (Wahhabism, 2019).

Al-Wahhab, in calling for a merciless struggle against Turkish rule and for driving the Turks from the original Arab lands, called them apostates. That is why the followers of Muhammad Al-Wahhab declared the Islam preached by the oppressing Turks to be wrong and ungodly (Wahhabism, 2019).

While showing, in accordance with the Koran, tolerance with regard to the "People of the Scripture" (Jews and Christians) the Wahhabites urged the need to toughen the requirements to the Muslims. Over time, predictably, a situation arose when the Wahhabites found themselves waging jihad against all the Muslims who did not share their religious views.

Thus, for example, in 1785 the Wahhabites attacked the tribes under the jurisdiction of Mecca. They besieged the city of Al-Taif, and then, after entering it, slaughtered almost all its people. And yet the city that now lay in ruins was inhabited by the people who considered themselves to be Muslims. The city was looted and its priceless religious books were burnt.

In 1800 the Wahhabites besieged Mecca blocking all the approaches to the city sacred for every Muslim. Hunger raged in the city. Masses of Muslims were dying at the hands of the Wahhabites. That same year the Wahhabites seized another holy city of the Muslims, Medina, where the room containing the grave of the Prophet Muhammad was looted. During the seven years of the city's occupation the Wahhabites stole all the decorations at Kaaba and destroyed the domes over the graves. They forbade repetition of the praise of the Prophet (salavats) after azan (the call to prayer) considering it to be a departure from true Islam. Muhammad ibn Abd-ul-Wahhab personally gave an order to execute the muezzin who read the praise to the Prophet (Wahhabism, 2019).

In early 19th century Wahhabism began to spread in India, not by chance, because jihad was declared on the English colonial authorities.

In 1830 the Wahhabites occupied Peshawar and created an Islamic state there. The ideas of Wahhabism became popular in Indonesia where its adherents on the island of Sumatra fought the Dutch colonialists.

The ideas of Wahhabism exerted a great impact on anti-colonial movements in Libya, Sudan and other countries (Wahhabism, 2019).

One need hardly seek to prove that in terms of the goals and tasks Wahhabism initially set for itself, and most importantly, in terms of the forms and methods it used to solve the task of liberating Arabs and then other peoples from foreign rule, it has nothing in common with the Islam that is traditional for Russia. Having said that, one cannot but agree with some of its ideas on the fundamental principles of monotheism.

Findings of the Study

Thus it was not love of peace, mercy and tolerance preached by the Koran and Hadith but a permanent state of confrontation and irreconcilable struggle against "oppressors" that shaped the aggressive and expansionist form of Islam characteristic not only of Wahhabism but of many other trends of Islam that are "foreign" to Russia.

In our opinion, it is impossible and unrealistic to set the task of changing the ideological essence of Wahhabism as well as other currents of "foreign Islam" through "preaching". It is necessary to adhere to the behest given in the Koran (2008) to the Prophet Muhammad, and through Him to all the believers: "There shall be no compulsion in (acceptance of) the religion the right course has become clear from the wrong. So who ever disbelieves in Taghut and believes in Allah has grasped the most worthy handhold with no break in it. And Allah is hearing and knowing" (Surah 2:256) (The Koran, 2008).

Preventing and counteracting religious extremism and terrorism in our country is another matter. On the one hand, measures need to be taken envisaged under the RF laws to stop the activities of extremist and terrorist organizations. In particular, to thwart their intention to overthrow the state system and legitimately elected power and to build a theocratic state. The legal system and law enforcement bodies should be uncompromising and merciless towards those who violate law and order in the country.

On the other hand, it is necessary to conduct massive educational activities in order to explain the destructive anti-Islamic essence of religious extremism and terrorism and, especially important, using the Koran, Torah and New Testament to demonstrate to religious people the inevitability of humankind's transition from canonical (religious) law to secular law. And accordingly, the need to live by the Constitution and the laws of the RF.

To this end, it is necessary, first, to provide a scientific basis for training a qualified cadre of clerics inside Russia who promote the essential worldview of Islam which is ultimately tolerant. Second, to create and publish in large quantities printed literature and audio-visual materials, including electronic information, on the shared worldview of the Torah, the New Testament and the Koran and on their intransient cultural value, remembering the words of Jesus Christ: "For truly I tell you, until Heaven and Earth disappear, not an iota, not a dot, will pass from the Law until all is accomplished" (Matthew 5:18) (The Bible, 1995).

Naturally, all the materials created must have a style and form of presentation that appeal to the broad public and not only to the people who consider themselves to be religious, including Muslims. Fourth, the country's media should take part in explaining the worldview of the Islam that is traditional for Russia.

Conclusions

Thus, in answering the question in the title of this article, we can safely say that confrontation between the Islam traditional for Russia, with the tolerance characteristic of the Koran and the Prophet's Hadith, and all other forms of Islam is inevitable. However, considering the constitutional norm on "freedom of conscience and religion" there can be no ban in the country under law on preaching various trends in Islam. Therefore, proceeding from the Koran and the Hadith of the Prophet it is necessary to develop ideological and educational means to counter the trends in Islam which claim to be solely right. Considering the massive integration and migration processes that have swept the whole world, the experience of Russia's religious existence may be useful to all the other countries.

Abstract

The presented study is devoted to the impact of migration processes on the institutional spheres of society. The article reasonably highlights the socio-cultural problems of penetration, stratification, rejection, isolation, which lead to modern migration processes. As research methods, the authors used the methodology of system-legal analysis of social phenomena, as well as historical-legal, formal legal and analytical methods. The article considers 2 types of cultures: culture of individualism and culture of collectivism, shows the pros and cons of each of them. It is the conflict of cultures that underlies interstate problems, because people always try to preserve their roots and their identity even after changing their place of residence. The article deals with a variety of objectives of migration policy, which are implemented taking into account the needs of the labor market, the economic situation in the country and attitudes in the society. The practical significance of the study is confirmed by its high scientific value, proved by natural differences in institutional trends under the influence of migration processes on the example of Germany, USA, Russia and other countries.

Keywords: migration processes, globalization, institutional trends, conflict of cultures, migration policy.

Introduction

The rapid migration processes in Europe, America and the middle East in recent decades have attracted attention to the problems in various countries, not only the inhabitants of these countries, but also politicians and lawyers, sociologists and political scientists, cultural scientists and psychologists.

The world migration process (and this is proved by the figures in the Figure 1 (United Nations, Department of Economic and Social Affairs, Population Division, 2017), affecting in one way or another the institutional changes, penetrates into all spheres of life of states: from politics, law and economics to education and culture. How do migration processes influence the institutional trends of public relations?

Literature Review

In the modern palette of economic theories, despite the emergence of most of them at the beginning of the last century, a special place is occupied by the socio-institutional concept. The growth of industry, stimulated scientists to understand the radically changing economic conditions and related relations.

At the beginning of the twentieth century, the prevailing historical school in Germany (Weber, 2018), with its multi-aspect approach to analysis, including socio-economic relations, was an intellectual stimulus for multivariate analysis of the economy. Widely understanding 'institutum', T.B. Veblen (1899), J.R. Commons (2012) and others considered the economy as a system where relations between economic entities evolved under the influence of economic and non-economic factors.

More than a hundred years ago, an analysis of economic and non-economic factors made it possible to formulate such shortcomings of capitalism as the violence of monopolies, the costs of free market forces, the growing militarization of the economy, certain vices of the "consumer society" (such as lack of spirituality, etc.). Reflecting on the problems of a hundred years ago and comparing them with the present day, it seems that the socio-economic relations in the world either stand still or were frozen, and people froze ... they are so relevant today (Mendes & Silva, 2018; Al Mashady et al, 2018).

However ... Conceptual ideas of the institutional-sociological direction prove the constant change of the economy, market space, causing a natural transition from one economic model to another. The idea of development along the ascending line to the highest moral and ethical goal sounded encouraging — as a prediction of overcoming the contradiction of business objectives and human needs (Tabatabaei et al, 2014).

Today there is a bipolar picture of the problem of transformation, institutional trends. On the one hand, scientific and technical progress, digitalization of society, including economic relations, equalizes participants of social relations, overcoming social contradictions, rising to a new level of "conflict-free social evolution of society" (the theory of convergence was born: R. Aron (2015), Y. Tinbergen (2006)). On the other hand, global migration processes have a significant impact on socio-economic transformations, complicating social contradictions, creating a conflict environment.

Results

The first migration processes were caused by the resettlement of people to free lands around the world. Mass migration in the 16th – 19th centuries was of a bilateral nature: on the one hand, Europeans rushed to America, South Africa and Australia, mastering vacant spaces. On the other hand, America was settled by black slaves brought from Africa. At the end of the Second World War, migratory "rivers" flowed from developing countries into countries with developed economies.

There are many reasons for migration: we will leave them to political scientists, sociologists and other scientists, because the focus of our attention is institutional changes, trends due to migration processes.

Today, migration processes have led to sociocultural problems of penetration, layering, rejection, isolation, and a number of others - i.e. to such bipolar tendencies due to, above all, the type of culture of peoples entering into a relationship. Cross-cultural studies of different countries and nations helped to correlate the peculiarities of their cultures, economic development and legal systems with the identified behavioral patterns of their representatives, since culture is the history of a people, their beliefs, traditions, habits and values. These differences, established by nature and transmitted in our genes, and resulting from the educational process, identify us in a group, shaping world outlook, values and priorities at the new stage of the generational development.

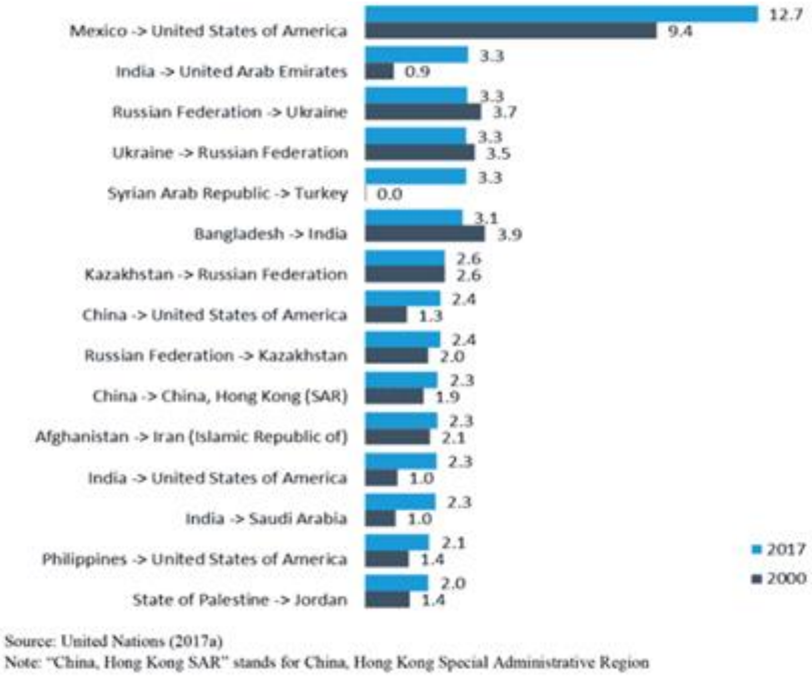

Figure 2. Fifteen largest populations of international migrants from a single country or area of origin living in a single country or area of destination, 2000 and 2017 (in millions)

Researchers traditionally distinguish the cultures of collectivism (for example, South Italy, Korea, Portugal, Japan, China, most countries of Asia, Africa and Latin America) and individualism (USA, Australia, Great Britain, Canada, Sweden, Belgium, Denmark, France, etc.) - These are fundamentally different basic values, attitudes, rules of conduct.

Amongst the advantages of individualism multiculturalism, democracy and the emphasis on the rights of the individual are to be marked. One person is punished in accordance with the law and only for his misdeeds. Same time the individualism is accompanied by loneliness and family conflicts, divorces and alienation, juvenile delinquency and early pregnancy, drugs and suicide, psychosomatic disorders and murders. Moral authorities are absent, and everything rests on the laws. Studies have shown that high value and the expectation of wealth negatively correlate with success and well-being, when money is the main motive of a person’s behavior. It turned out that behavioral violations and crimes are higher among the materialists. Also, a high level of distress is associated with a high desire for power, with a desire to control, suppress others (Figure 2) (United Nations, Department of Economic and Social Affairs, Population Division, 2017).

The essence of the culture of individualism, as it is known, is the focus of people on the resolution of conflict by legal means. Such a society requires a greater number of lawyers and courts than in collectivist cultures, where the conflict is resolved informally, with the use of intermediaries - reputable relatives or acquaintances.

On the one hand the traditional collectivist cultures usually has a lower crime rate, which is related to the type of socialization - taking care of children, encouraging interdependence and avoiding problems related to crime, alcoholism and drug addiction. On the other hand, authoritarianism and pressure on the individual in collectivist cultures are higher - children are often forced to choose not what they like, but what their parents like. Under collectivist culture on a community scale, there is a greater likelihood of autocratic regimes, in which persecution of dissidents is frequent and there is great competition among individual groups for power (Bagreeva, 2013).

Thorston Sellin, having published the work "The Conflict of Cultures and Crime" (Sellin, 1938) in 1938, proving the criminal nature of this phenomenon, has drawn attention to a wider range of problems.

The essence of the conflict of cultures lies in different attitudes to life, habits, stereotypes of thinking and behavior, when different values underlie differences and the other life ideals do not cause respect, compassion and sympathy, and often upholding one's own ideals causes persistent rejection leading to conflicts.

Over the past century, we have repeatedly stated not only intrastate, but also intergovernmental problems, which were based on the conflict of cultures.

Modern scholars (American sociologist A. Cohen (1955) and others) also point to institutional sociocultural tendencies that are driven by migration. "The clash of cultures was not an easy task. It is extremely difficult for people to abandon their culture and adapt to another, a new one. The clash of cultures usually leads to conflicts and opposition. People want to preserve their roots and their identity even after they changed their place of residence". The judgment expressed by R. Kapuscinski (2008) is based on the analysis of migration processes and gives the development of the idea of socio-psychological institutionalism (Veblen, 1899) as one of the directions of the theoretical economics.

In turn, the locals assert their identity as well. Thus in Hamburg (Germany), an advertisement for the kindergarten Kita Rabenhorst appeared, where one of the advantages of the institution was called "a small number of children from migrant families". The public outraged such a statement and the brochure was rewritten. After that, in the advertising of this kindergarten, among such advantages as the location in a prestigious district, the predominance of children from wealthy families, the following phrase appeared: "Our kindergarten is open for all girls and boys; it does not matter low and high, strong and weak, sick and healthy, well-fed and thin ones - regardless of whether they are of German origin or from migrant families." This example of tolerance is rather the exception.

The experience of foreign countries is not the same: positive, such as in Australia, where highly qualified specialists are invited to live; and negative - Germany, southern Italy and other European countries, where the uncontrolled flow of migrants created all sorts of problems for the local population. Every State today develops a migration policy taking into account the needs of its labor market, the economic situation in the country and attitudes in society.

Economically developed Germany, having shown unprecedented humanism, populism and democracy, today suffers from a huge number of migrants. The distribution of illegal immigrants was one of the main reasons for the recent domestic political crisis in the Federal Republic of Germany. In addition, interstate problems also arose: German Chancellor A. Merkel and Hungarian Prime Minister V. Orban could not agree on the migration policy: his country refused to accept back refugees even registered in that country (Gazeta.ru, 2018; Safdari et al, 2013).

Institutional trend of influence on migration processes in Germany through the issuance of laws and court rulings implements social and legal institutionalism (Commons, 2012), proclaiming legal relations as the basis for economic development. Also, the courts of Germany in January-May 2018 decided to deport 24 thousand migrants. However, the police were able to execute the sentences only for 11 thousand migrants (less than 50%!): the influence of court decisions is not as significant as the Germans would like.

Of course, each country itself, taking into account the recommendations of international law, formulates its position with respect to migrants. For example, Estonia, in which the number of Ukrainians who received a permit for short-term work and a temporary residence permit in 2018, has doubled compared with the previous 2017, (and ten times when compared with 2014), considered it possible for itself. However, the basis of this decision of the Estonians was to rely on EU economic assistance.

It should be recognized that there are countries that hold a different position and do not support The Global Compact for Safe, Orderly and Regular Migration — GCM, approved by the international conference in Marrakech (Morocco) in December 2018. The United States withdrew from the discussion of the pact at the end of 2017. Australia, the Netherlands, Austria, Bulgaria, Hungary, the Czech Republic, Poland, the Dominican Republic, Chile, Latvia, Slovakia, Estonia and Italy either refused to take part in the conference or ruled out signing the agreement.

The states, above all, decide on the need for additional labor resources, understanding that the majority of migrants are middle-aged men, who very often have only primary education, possessing just basic skills of professional activity. However, receiving low-skilled and low-paid work, men transport their families, as a rule, with unemployed wives and a large number of children. In turn, the solution of the emerging complex of socio-economic and socio-cultural problems becomes the task of social services of each state.

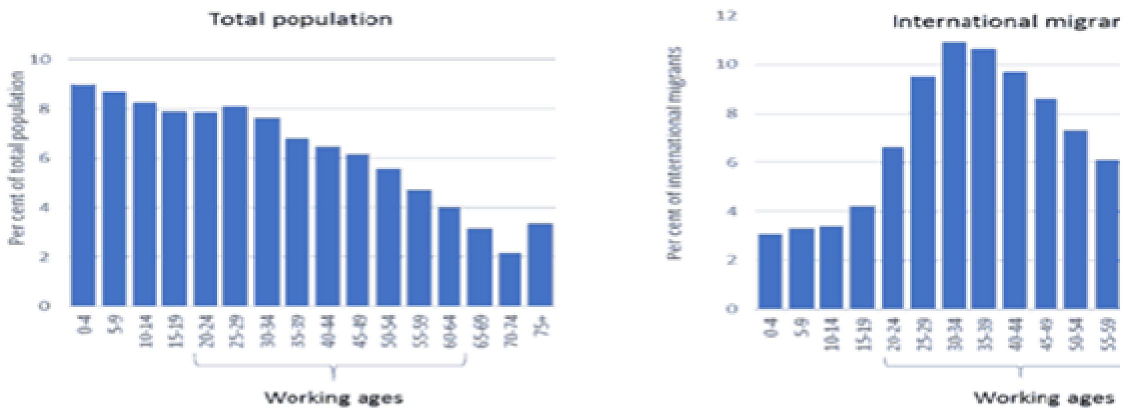

Figure 3. Age distribution of the total population and of international migrants worldwide

It should be understood that migration policy often creates conditions even for serious inter-state tensions, which are often based on the conflict of cultures, setting in motion the institutional foundations of states.

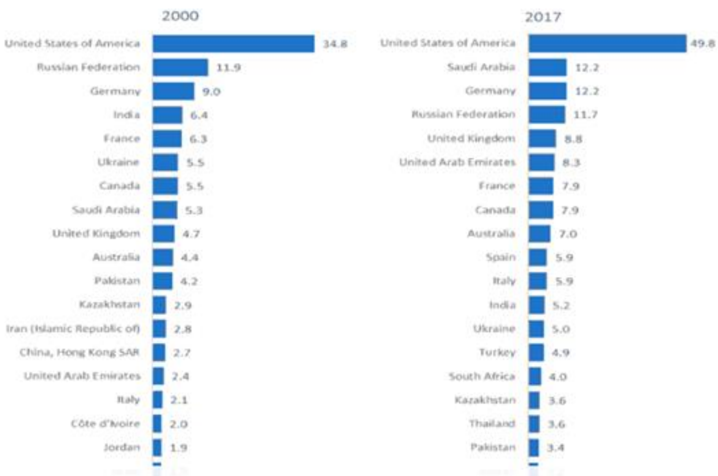

Figure 4. Migration statistics: 20 countries where most international migrants live, million

Conclusions

Thus, migration processes cause not only domestic institutional changes, but also lead to international conflicts, since the goals and objectives of the migration policies of states are different. Each state, weighing all the pros and cons of the influx of migrants, takes certain measures, including legislative acts that ensure institutional changes.

The policy of the Russian Federation in the field of migration processes, first of all, is based on the principles and norms of international law in the field of protection of the rights of migrants, the inadmissibility of their discrimination on the basis of race, gender, nationality, origin, etc.

The concept of social and legal institutionalism (Commons, 2012), whose followers proclaimed legal relations as the basis for economic development, formed the basis of the Russian position on migration processes.

Modern Russia conducts a balanced migration policy, analyzing the need for labor resources without disturbing the sociocultural balance of nations and nationalities, both in regions and throughout the country as a whole. As can be seen from the Figure, the percentage of migrants in Russia practically does not change, which allows the country to experience an evolutionary transformation, mutual influence and synthesis of two basic cultures. We are witnessing the birth of a different type of culture based essentially on the balance of values of an individualistic and collectivist culture. In our opinion, it is this balance, enshrined in the legislation that creates conditions for the economic stability of the state.

The country's leadership constantly pays considerable attention to creating and strengthening the legal framework for the regulation of migration in the Russian Federation. It consists of: the Constitution of the Russian Federation, the Federal Law "On Forced Settlers" N 4530-1 of February 19, 1993 (as amended on December 27, 2017), the Federal Law "On Refugees" N 4528-1 of February 19, 1993 (as amended on December 27, 2017), Federal Law “On Citizenship of the Russian Federation” N62 of May 31, 2002 (as amended on December 27, 2017), Decree of the Government of the Russian Federation of May 23, 1998 N 484 “On the Amount of One-Time Cash Benefit and the Procedure for its Payment to a Person who received a certificate of consideration of the application for recognition of a refugee "and other regulations. In addition, in R The Federal Law “On the procedure for departure from the Russian Federation and entry into the Russian Federation” dated August 15, 1996 N 114-ФЗ (as amended on October 11, 2018) and the Federal Law “On the legal status of foreign citizens in the Russian Federation” dated July 25, 2002 (as amended on December 27, 2018).

These laws have been amended to change the rules of entry, grounds for deportation, the situation of migrant workers. Probably, the situation on the Russian border in the Far East of the country will require Russia to revise its attitude to the visa regime, to pursue a protectionist migration policy that would be in the interests of domestic policy and security of Russia as a whole.

After analyzing all the pros and cons, Russian President V.V. Putin at the VI World Congress of Compatriots said that he had signed a new concept of state migration policy, which would simplify the acquisition of Russian citizenship for compatriots.

Modern institutional tendencies of states largely depend, firstly, on migration policy and, secondly, on ways of solving the problems of migrants, and the economic effect of institutional transformations is caused not only by choosing one or another direction of theoretical economics, but by overcoming and transforming the conflict of cultures into a socio-cultural state stability.

Abstract

Over the past two decades, fundamental changes have occurred in the process of the formation of students' professional competencies, which is due to the development of new educational technologies. However, the issues of application of these technologies, in particular VR-technologies, within the framework of psychological, pedagogical and technical-ergonomic aspects remain debatable, which makes the study relevant. The purpose of this study is to determine the prospects for the use of VR - technologies in the process of formation of students' professional competencies, as well as problems hindering their application. In the process of studying this problem, such research methods as the study and synthesis of training experience in higher educational institutions, training in the framework of corporate training, statistical methods of analysis, and the method of expert assessments were used. The study by the authors of the article on the best foreign and domestic practices allowed highlighting the advantages of VR technologies in the formation of professional qualifications at the level of individual companies (corporate training system) in the process of forming professional competencies of students. The authors of the article gave an assessment of the B2B market of the virtual reality technology market. The article describes the problems that hinder the more intensive use of modern technologies for the formation of students' professional competencies. Based on the conducted research, the actual directions of improving the use of VR technologies in education are formulated. The article may be of interest to practicing teachers, employers, students and for all who are interested in using VR - technologies for the formation of professional competencies of students, as well as in the training process in the framework of corporate training.

Keywords: VR technologies, competencies, training, students, professional qualifications.

Introduction

ABI's research showed that companies that implement VR training programs save up to 80% of training time (The global AR / VR market in 2018 will increase to $ 18 billion, 2017). In addition, the efficiency of training increases, as students learn more quickly and acquire the necessary production skills more easily.

Virtual reality (VR) technology is based on the use of computer graphics, which create virtual scenes and elements that the user will manipulate using input devices so that they can be seen, heard, touched, and even smelled using output devices, and the user may feel highly immersive when interacting. Using a well-designed and built virtual reality system, users feel completely involved in this action. In virtual reality, the shown environment is completely virtual, which is opposite to the real world, and between them there is an augmented reality and augmented virtuality (Ivanova, 2018; Kenan, 2018).

Thanks to the properties, we will dry out the inherent VR technologies and, above all, the possibility of obtaining practically real work experience in a harmless virtual environment, these technologies can become an ideal tool for training and developing professional competencies of students and employees of various enterprises. Currently, VR technologies are widely used in many areas, such as military, aerospace, aviation, surgical, and others (Zhang, 2017). In Russia, there are also a number of studies on the features of the use of VR technology in the formation of professional competencies of students from various industrial universities (Korneva, 2016; Vyaltsev et al., 2017; Mankhi, 2018).

Recently, a lot of research has been carried out on the possibilities of using VR technologies in teaching and development of students, as well as in the system of corporate training. Many researchers (Burdea & Coiffet, 2003; Foreman & Corallo, 2014) write that virtual reality will lead to a paradigm shift in education and training, but there is little empirical evidence about its educational value.

G. Makransky, T.S. Terkildsen and R.E. Mayer (2019) conducted a study whose main objectives were to determine the implications of adding immersive virtual reality to virtual learning simulations, as well as a study on whether the principles of multimedia learning apply to immersive virtual reality.

A study of student opinions by M. Shanahan (2016) shows that virtual radiographic simulation plays an important role in the development of technical and cognitive skills.

According to A.Z. Sampaio et al. (2019), virtual reality technology can be used as an addition to three-dimensional (3D) modeling, which ultimately will lead to improved communication in the field of vocational training as well as in education or professional practice. The introduction of CAD and VR methods is useful already in school to prepare students to use these technologies as the most important basis for their development at a later stage of their professional practice.

The results of the study by G. Makransky and G Petersen (2019) showed that there are two main ways in which desktop VRs lead to an increase in the amount of learning after a VR lesson: an affective path that runs through the functions of VR, presence, intrinsic motivation and self-efficacy; and the cognitive pathway that went through VR functions, usability, cognitive advantages and self-efficacy. It is concluded that learners can benefit from desktop VR simulations that emphasize effective VR functions and a high level of usability.

In addition, the use of VR-technologies makes it possible to increase the efficiency of teaching students who have any health restrictions, including disabled children. In the Russian Federation, the Ministry of Science and Higher Education believes that in every educational room (in lecture halls, classrooms for practical classes, training workshops, library, etc.) it is necessary to provide for the possibility of equipping 1–2 places for disabled students for each type of violation health - musculoskeletal, hearing and vision (Bayat et al, 2014). However, it is not always possible to equip a workplace in the laboratory for disabled students, as well as to ensure the safe execution of tasks. According to A.S. Akhlimanova, D.A. Kuznetsova and O.M. Vakhrusheva (2017), in such cases, the organization of learning with the help of VR technology can give a particularly high effect. The use of VR technologies in the process of teaching students with disabilities at minimal cost will contribute to improving the educational process, as well as the adaptation of people with disabilities to the educational process and to the environment.

Methodological Framework

In the process of studying the problems and prospects of using VR - technologies in the process of forming professional competencies of students, such research methods as the study and synthesis of experience in training personnel in higher educational institutions, statistical methods of analysis, the method of expert assessments were used.

The study of the problems and prospects of using VR - technologies in the process of forming students' professional competencies was performed using the following information sources:

– research results of consulting firms and recruitment agencies;
– materials of scientific conferences;
– scientific publications on the problems of using VR - technologies in education, etc.

The use of theoretical and empirical research methods, statistical analysis methods and expert evaluations of employers allowed the authors to highlight the advantages of VR technologies in the formation of professional qualifications at the level of individual companies (corporate training system) in the process of forming students' professional competencies and to justify the direction of improving the use of VR technologies in education.

Results and Discussions

3.1. The Essence of VR - Technology and the Direction of their Application in the Process of Forming Professional Competencies of Students

The first attempts to create interactive devices that allow interacting with the simulated reality or complementing reality with information imposed were made at the beginning of the 20th century, the concept of mixed reality itself (“the continuum of reality-virtuality), whose elements are AR and VR in the modern view, is quite young (24 years), as well as the market of the technologies of virtual and augmented reality. And although the notions and concepts of virtual and augmented reality have not undergone radical changes over the past 30 years, but virtual and augmented reality technologies have gone through a significant evolutionary path in terms of improving devices and software and content, and have already experienced several growth spikes.

According to L.V. Kurzaeva et al. (2017) today the following directions for the development of product markets based on the use of virtual reality technology are identified. The first is connected with the study of virtual and augmented reality technologies as a new direction in the information technology industry, the fundamentals of creating virtual and augmented reality applications (VR, AR). The second direction is pedagogical design of teaching aids based on technologies of virtual and augmented reality. The third is the definition and experimental verification of the organizational and pedagogical conditions for the effective use of such teaching aids in the educational process.

Summarizing the results of existing studies of Russian authors in the field of application of VR-technologies in education (Sobolev & Kiseleva, 2014; Kornilov & Popov, 2018; Danilenko & Yarusheva, 2018; Emam & Shajari, 2013), it can be concluded that the formation of the professional competencies of students involves not only the study of the theoretical aspects of these or those activities, that is, the acquisition of new knowledge, but also the formation of certain skills in specific areas of professional activity.

3.2. Evaluation of the B2B Market of the Virtual Reality Technology Market

In 2017, Snap company representatives reported that nearly 70 million users spend an average of three minutes per day with AR objects. Large technology companies like Apple and Google, Snap, Facebook, Niantic Labs, Adobe and startups like Blue Vision Labs help developers and content creators produce better products based on the use of VR technology. The most popular products were based on the use of smart glasses, various 3D tools and SDKs. (The Venture Reality Fund released a report on the global landscape of augmented reality, 2018)

According to Augmented Reality, the market for virtual reality technology could grow from 5.2 billion dollars in 2017 to 34.1 billion dollars in 2023. The forecasts of GoldmanSachs are less optimistic - its forecast is $ 28 billion in 2020. According to experts, by 2021 mobile devices of augmented and virtual reality (approximately 75% and 16%) will be most popular, the remaining share will be approximately equally divided between wearable devices of virtual and augmented reality (After mixed year, mobile AR to drive $ 108 billion VR) / AR market by 2021, 2017)). At the same time, the share of software in the B2C segment will be 54%, and in the B2B segment - 46% (The Real Deal with Virtual and Augmented Reality, 2016). The main market drivers in Russia are virtual reality technology for mobile devices and the development of content for viewing video format 360 ° and undemanding in terms of technical characteristics.

In Russia, the consumer market for devices, software and content for virtual reality by the end of 2016 was estimated at $ 21.7 million, the B2B solutions market was $ 6.2 million. The structure of the Russian B2B virtual reality market by project areas is represented by figure 1.

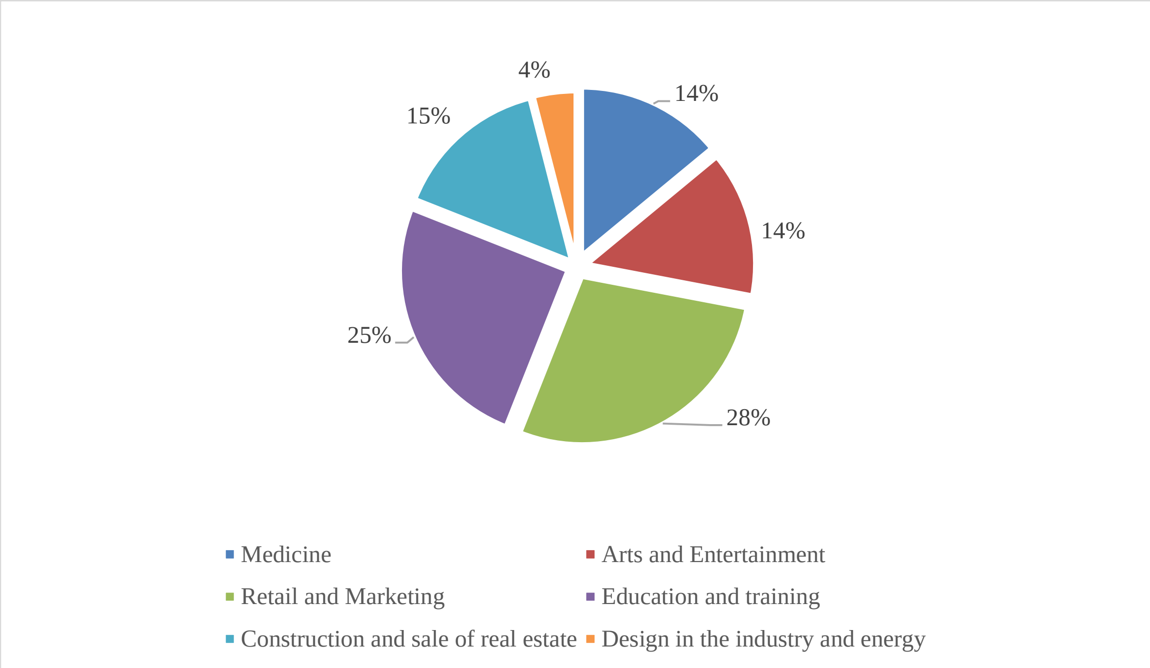

Figure 1. The structure of the Russian B2B market of virtual reality technologies by project areas (at the end of 2017)

Evaluation of the dynamics of the user base of the main virtual reality platforms in Russia from 2016 to 2018 shows a significant increase - by 70% in 2017, and by 55% in 2018 compared with the levels of the corresponding previous year (Figure 2).

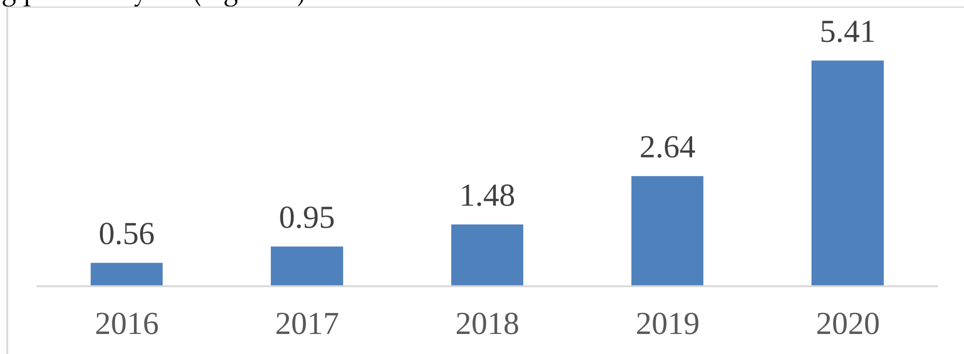

Figure 2. Dynamics of the user base of the main platforms of virtual reality in Russia, million dollars.

An assessment of the market development prospects as of the beginning of 2019 shows that the market is developing intensively, new products and technologies are emerging, although not everything is so clear. So, according to Greg Sullivan, director of communications for Microsoft Mixed Reality, the entire VR industry has experienced both growth euphoria and decline with disappointment. The technology, according to a Microsoft representative, has great prospects, but now its potential is not realized (Microsoft: VR did not meet expectations, 2019).

Microsoft Mixed Reality introduced the immersive VR headsets as consumer devices, and they generally failed to meet the high expectations that were placed on them. Figure 3 shows the different variants of such a headset.

Figure 3. Microsoft Mixed Reality VR Glasses

Virtual reality glasses and helmets have become increasingly mass-produced since 2015. Modern virtual reality systems (VIVE) are significantly different from the first samples. The latest advances in the study of the brain-computer interface (BCI) (Figure 4) have become increasingly used.

Figure 4. Classic VIVE, refined by Neurable, which can additionally capture brain signals (Mike Ambinder from Valve will talk about neural interfaces at GDC, 2019)

Presented in Fig. 4 virtual reality helmet additionally uses eye tracking technology and other indicators. Already in the short term, VR helmets could be improved using neuro interfaces.

3.3. Problems and Prospects of Using vr - Technology in the Process of Forming Students' Professional Competencies

As it is shown in Fig. 1, at the end of 2017, 25% of the entire Russian B2B market of virtual reality technologies is occupied by products developed for the education and training system. However, the issues of applying these technologies in education within the framework of psychological, pedagogical and technical-ergonomic aspects remain debatable. This is due to the following reasons:

– incorrect assessment and lack of understanding of the possibilities of using virtual reality in education. Currently, there is not enough objective and comprehensive research into the possibilities of using virtual reality technologies in education. There is a steady prejudice on the part of teachers that this technology is intended exclusively for games and other entertainment;

– misconception about the ergonomic characteristics of modern hardware, virtual and augmented reality. In particular, there are many publications in which it is argued that virtual reality glasses have a bad effect on vision, contribute to the rapid fatigue and fatigue of users of glasses (Lobodenko & Batyreva, 2017);

– lack of an extensive scientific and methodological basis for designing, implementing and using teaching aids using virtual reality, resulting in caution and mistrust of the teaching community to these technologies, and as a result - low efficiency of their use in the educational process.

At the same time, the use of VR-technologies in education has several advantages over traditional methods (Danilenko & Yarusheva, 2018):

– Visual representation - three-dimensional graphics allows visualization of certain phenomena or situations. For example, the use of VR in the energy sector makes it possible to consider a specific object and split it to a molecular level.

– Safety - managing air transport in critical conditions, modeling surgical or space operations allows working out a specific situation without risking your life.

– Focus - thanks to the technology of 360 degrees and full presence, VR allows focusing on a specific action without the influence of external sources that can affect the learning process.

– Novelty - this technology because of its relevance and futuristic helps to increase the level of involvement in the process.

– Saving resources - although the use of VR-technology is quite expensive at the present time, nevertheless, large companies still decided to implement this tool, while saving a huge amount of time and a number of other resources.

In addition, there are a number of advantages of VR-technologies in the formation of professional qualifications at the level of individual companies (corporate training system):

– reducing the time of training and instruction with an increase in their effectiveness, due to visibility and interactivity of information, greater involvement in the educational process;

– reduction of expenses for consumables, development of methodological support and other training materials;

– reducing the cost of teachers and business coaches while increasing the number of students;

– the ability to simulate different production situations, with the same “input conditions”, which contributes to the development of soft-skills, including behavior in non-standard situations.

Conclusion

The authors of the article have repeatedly investigated the use of modern technologies for the formation of students' professional competencies (Yumatov et al., 2017), as well as in the training process in the framework of corporate training (Mironova et al., 2017; Rodinova et al., 2017).

As part of this study, an assessment of the VR technology market and the applicability of these technologies in universities and the corporate training system was made.

According to the results of the study, it was concluded that there are a number of problems that hinder even more intensive development of this market:

– inconvenient in practical use of equipment for the application of VR technology, as part of this equipment involves the use of cumbersome or inconvenient headsets;

– low quality and limited range of content used in educational programs using VR technologies;

– high cost of equipment, and above all, helmets, glasses;

– high cost and problems with the compatibility of specialized software with the requirements of a particular business, the adaptation of foreign developments for the national economy;

– undeveloped privacy and cybersecurity issues;

– the impossibility of achieving the effect of full immersion and used of platforms.

Thus, one of the most relevant areas for improving the use of VR technologies in education is to improve the design and mobility of virtual reality devices without compromising the technical characteristics of devices. In addition, it is very important that developers of devices based on VR technologies carry out explanatory work with the teaching staff, managers and employees of corporate training centers.

Abstract

The presents analysis of the research practices that offer methodological foundations for studying the problems and perspectives of state regulation in the sphere of formation of scientific and innovational potential of the youth. It is concluded that there is a clear dependence between students' involvement in scientific activities and the emerging transformation of value orientations of future young scholars. Dynamics of the research showed stable significance of such values as freedom of creativity, competence, social significance of professional activities against the background of reduction of the values of career perspective, conditions and material components of labor, prestige in society, and group solidarity in a work group. Research and analysis of specifics of reproduction of potential of the youth as the main resource of development of innovational economy of the country allowed for the conclusion that formation of scientific and innovational potential of the youth requires systemic, well-planned, and effective state regulation.

Keywords: state policy, scientific and innovational activities, youth, science, education.

Introduction

In the completely new socio-economic and geopolitical conditions of functioning of the modern Russian society, the role of science as a strategic resource of innovational development of a country grows. Functioning of science is closely interconnected to the real market economy and is a part of society's innovational economy, which determines its progress.

In the recent decade, the Russian science has been associated with destructive processes and has been undergoing the period of systemic transformation of the institutional structure. Political, socio-economic, and administrative reforms, economic decline, destruction of production, and ethnopolitical conflicts caused a comprehensive and deep crisis of the Russian science. The modern model of the Russian science could be called transitional and, thus, ineffective. Among many problems of the Russian science, discussed by the expert society, one of the main problems is urgent deficit of young scholars. A negative tendency has been observed recently during hiring of graduates of universities by the organizations that deal with R&D. Since 2005, the share of graduates in the number of hired persons has been decreasing (from 27.4 % in 2005 to 18.4 % in 2015); the share of graduates that deal with R&D decreased from 2.8 % in 2005 to 2 % in 2015 (Indicators of science, 2018). According to the statistical data, average age of a researcher is 47 (Indicators of science, 2018)

Absence of responsible and pragmatic state policy led to destructive processes in the scientific society, decline of prestige of science, and reduction of the level and quality of life of the scientific community, which stimulated mass emigration of scholars: they leave the sphere of science in favor of a more profitable sphere or try to find a job abroad.

Together with administrative transformations of the scientific community, the socio-cultural transformation of the unique scientific ethos – totality of the normative rules of behavior that dominates over the whole scientific community – takes place (Merton, 2006). It is the institutional environment for formation of professional ethos of young scholars in the process of professional socialization.

Professional socialization is a multi-level process aimed at person's mastering special knowledge, socio-professional abilities and skills, values, and norms for achieving high professionalism as the basis for effectiveness of professional activities and oriented at development of innovational, adaptation, and integrative qualities of an individual that are necessary for his effective inclusion into the professional and labor society.

Successful process of professional socialization of young scholars is the main factor of strengthening of scientific personnel in the sphere of science and education. This process envisages successful inclusion into a profession and formation of a sense of professional identity and allows the subject of social activities to master professional skills, abilities, and models of behavior. The criterion of the result of professional socialization is correspondence of professional training of a young specialist to the requirements that are set by the specifics of scientific activities (Tastan et al., 2018).

The transformation processes that take place in the Russian society make a young scholar change his social trajectory and adapt to the market circumstances, refusing from the norms and values peculiar for the socio-cultural code, which leads to the loss of the reproduction mechanism in the scientific sphere

Research Methodology

Due to constant socio-cultural transformation of scientific ethos as a totality of normative rules of behavior that dominate over the whole scientific community, which is the institutional environment for formation of professional ethos of young scholars in the process of professional socialization, we used the theory of science's ethos of R.K. Merton (2006) as the main methodological principle.

The Russian and foreign research environment pays close attention to the problems of reproduction and specifics of professional socialization of scientific personnel. Thus, P. Bourdieu (2001) analyzed the theory of human capital and presents professional capital as a complex of abilities and skills of a person, which are used within implementation of the professional activities for obtaining income.

In this article, the authors use the foreign theoretical and methodological approaches to studying professional socialization, which are adapted to studying the scientific and innovational activities of the youth. Thus, the functionalist approach is based on sociology of French positivism (Wentworth, 1980; Hoy and Rees, 1977 etc.) and treats professional socialization as a structural component of a wider social context (Wentworth, 1980; Hoy & Rees, 1977). The interpretation approach is based on the German idealist tradition in the humanitarian and sociological thought (Lacey, 1985) and focuses on the subjective aspect of the process of socialization (Lacey, 1985). This approach is based on anti-positivism, nominalism, and voluntarism, which forms the understanding of professional socialization. The critical approach is based on the theoretical concept of Marxism and the Frankfurt School (Bolster, 1983; Wexler, 1987) and connects the change of the processes and the mechanism of professional socialization to the changes of the general social process (Bolster, 1983; Wexler, 1987).

This research is based on the ideas of such Russian authors as M.K. Gorshkov and F.E. Sheregi (2010), Y.A. Zubok, T.K. Rostovskaya and N.L. Smakotina (2016), who developed the theoretical and methodological approaches to studying youth as a socio-demographic group. Most researchers define youth as a special socio-demographic group, distinguished on the basis of age and socio-cultural characteristics: uncertainty of status in society, social marginality, etc. The youth that are involved in the sphere of science are one of the specific socio-professional groups, with specific features and qualities. On the one hand, it has the features and characteristics of the youth on the whole, and, on the other hand, it is included into the professional scientific community of scholars that is important in the knowledge society. It is necessary to note mismatch of the status elements – primarily, level of income and education – which is caused by the insufficient level of transfer of the cultural and educational capital into the economic capital. As a result, half of young people have the growing feeling of social marginality, which is expressed in dissatisfaction with social position, lack of confidence in future, insufficient identification with the scientific community, psychological discomfort, etc. A peculiarity of the socio-professional group of young scholars is significant dependence of its social position on the state policy in the sphere of science. That's why reduction of the social status of the Russian scholars influences the reproduction of this professional group on the whole.

The problems of professional socialization are studied in this article in the conditions of the scientific and educational environment of a technical university, and the start of formation of professional competences of a young scholar takes place in the period of studying in a university. Technical universities, as a platform for the scientific and educational integration, have the applied and practice-oriented character and follow the modern tendency of competition, developing inter-disciplinary and inter-professional ties that are oriented at increasing the socio-adaptive and research culture of graduates. Focusing on human resources, university – as a special social organization – has to form such culture in which ability for scientific and innovational activities is a special value (Vodenko, Tikhonovskova & Ivanchenko, 2015; Vodenko et al., 2016; Vodenko et al., 2017).

The basis of scientific research of formation and reproduction of scientific and innovational potential of the youth is the complex of sources of empirical information, which includes the results of sociological research, performed by the authors in 2011 - 2017 via personal questionnaire survey of undergraduates and young scholars of the leading technical universities of South Russia. Representativeness of the performed research procedures is ensured by means of implementation of multi-level quota selection. The selection was calculated for two groups: 1st group – undergraduates of technical universities (total selection - 2,627 respondents); 2nd group – young scholars (total selection - 358 respondents). The main purpose of the research was to study the motivating factors of scientific activities and to determine the level of prestige of the profession of a scholar, career orientation of undergraduates at scientific and innovational activities, and the problem of state regulation in the sphere of formation of scientific and innovational potential of the youth.

Results

Transformation of internal goals and motives of young people, predetermined by adoption of the market model of behavior and growing commercialization of science, influences the attitude of undergraduates towards science and innovational activities.

Thus problem is especially important in the conditions of development of modern higher education. The system of modern higher education is integrated in subjective space of socio-economic relations, which present the set of its stakeholders. There's a necessity for new approaches to managing higher education on the basis of regulation of interaction between its stakeholders and, accordingly, development of scientific substantiation of the theories and principles of managing socio-labor relations and scientific and innovational activities.

Undergraduates and postgraduates are not a closed self-developing system, so understanding and systemic analysis of the processes that take place in the youth community are conducted in direct causal connection with social changes in the Russian community and with state measures that are taken within the modern youth policy. Based on this, a complex analysis of socio-economic factors that influence the formation of career perspectives of college students in the sphere of science is performed; quantitative and qualitative indicators of statistical (objective) and estimate (subjective) data are studied (Vodenko & Ivanchenko, 2013).

Organization of research work in university is the main platform in training of future scientific personnel. Organization of the research work in university determines formation of research competences with undergraduates and their acquaintance with peculiarities and specifics of the scientific community. However, undergraduates' treatment of science is peculiar for the pragmatic emphasis: for most of them science is not a mandatory condition of professional education, but science, including student conferences and forums, contains the resource of career growth and allows strengthening the motivation for achievements.

Scientific work attracts 47.2% of the respondents, creative character of work and possibility of self-implementation attract 40% of the respondents, and the possibility of studying that which is interesting attracts 26.2 % of the respondents. 34.8 % of the respondents want to be involved with science upon graduation (answers "yes" and "rather yes than no"). Low prestige of scientific activities is indirectly confirmed by the fact that the share of those inclined for scientific work constitutes 6-8 %, but only 0.5% of graduates do devote themselves to science. It should be noted that the "yes" and "no" answers prevail. 33% of the respondents are ready to choose a scientific career (Table 1).

Table 1. Readiness of undergraduates of technical universities to be involved with research activities (% of the respondents).

Variants of answer / Respondents	Yes	Rather yes than no	No	Rather no than yes
Bachelors	12.5	12.3	23.4	33.6
Masters	25.7	28.1	27.4	17.4
General for the selection	15.3	19.5	24.2	30.2

Analysis of the scientific and innovational environment of a higher educational establishment allows evaluating the form of organization and complexities of implementing scientific and innovational activities in a university. Very often, university environment is a place of "acquaintance" of students with the scientific & innovational and technological creativity. Thus, answering the question "What was the start of your technological creativity?", students say that it started in the university environment and give a specific event: 27.7% of the respondents started with participation in a conference, forum, etc.; 24.1% of the respondents were influenced by the lecturers; 20.2% of the respondents were attracted to the work in a laboratory. It should be noted that 10% of the respondents said that they were always interested in scientific and innovational activities.

Organization of scientific and innovational activities of students was evaluated with analysis of difficulties faced by the respondents in the process of scientific and innovational work. Analysis of difficulties was performed at the stage of scientific research and at the stage of promotion of results and innovations, as scientific and innovational activities envisage scientific inventions and promotion of the obtained innovations (their commercialization). The first place belongs to the financial component at the stages of research and implementation (46.5% and 47.2%, accordingly); also, undergraduates note the deficit of scientific communication (38.3%) and regional closeness (27.9% and 23.4%) (Table 2).

Table 2. Difficulties faced by the students in the process of scientific and innovational activities in a university.

Difficulties	At the stage of scientific research	At the stage of promotion of result and innovations
Absence of financing (investments)	46.5	47.2
Deficit of scientific communication	38.3	37.1
Absence of interest to new ideas in business	28	26.3
Lack of scientific literature	23	20.8
Insufficient knowledge of foreign language	22.9	23.4
Regional closeness	22.9	23.4
Weak material and technical base	22.8	30.5
Personal qualities	20.8	18.6
Difficulties with publication of results	15.9	15.1
Doubts in significance of results	14.6	6.6

Weak scientific management	12.4	12.6
Lack of organization	11.7	6.9
Absence of knowledge in the specialty	7.7	4.5

The problems in scientific and innovational activities consist primarily in absence of proper financing of student science from government structure and from business structures – which, due to different reasons, are not interested in investments into university science. Besides, students distinguish such problem as deficit of scientific communication. Apart from free access to scientific information at the stage of research, the respondents need the opportunity to visit scientific events, at which they would approbate their scientific results, learn the experience of other scholars, and obtain new knowledge. Due to absence of communication, future scholars feel regional closeness (22.9 %). In the course of promotion of results and innovations, an important problem is weak material and technical base of a university (according to 33% of the respondents). Personal qualities and lack of organization are the last positions in the rating of difficulties.

Discussion

The research results show that in the conditions of liberalization of economy, when activities in the scientific sphere are positioned as one of the types of professional activities, which requires high qualification, there's a necessity for smart state policy in the sphere of attraction of scientific personnel. Turning science into a competitive sphere of activities, which includes high professionalism and decent payment for scientific labor, allows a young scholar to implement his moral and ethical system with value priorities and ideas on ideal science and scholar.

The research showed that 47.2% of undergraduates are attracted by scientific activities, and 34.8% are ready to conduct scientific activities. Students' refusal from science is predetermined rather by objective, not subjective, reasons, of which the financial problem is the main one. The material component is very important, especially in case of the young generation. Young people value the possibility of career growth, material well-being, possibility of self-implementation, stability, and social importance. The leading position belongs to the variant "work has to be interesting and well-paid". However, if the respondents are to make a choice, 40% of them choose a boring job with high wages, while 34% are ready to accept interesting job with low wages. Almost all respondents (98.2 %) are ready to continue scientific career if the university's management helps with the accommodation. This problem, which is the most important for young scholars, may lie in the basis of development of the programs of support and motivation of young scholars at all levels. The main directions of state policy that are aimed at development of scientific innovational potential (according to young scholars) are given in Table 3.

Table 3. The main directions of state policy in the sphere of formation and reproduction of scientific and innovational potential of the youth.

Main directions	% of the number of the respondents
Annual competitions for young scholars, financed from the budgets of different levels	69.4
Long-term cooperation between scientific centers in Russia and abroad	58.4
Support for entrepreneurial initiatives of youth: creation of small companies	48.8
Stimulation for additional education, advanced training of young scholars	46.4
Support for innovational and entrepreneurial initiatives of the youth: legal, accounting, information	40.2
Provision with necessary scientific equipment	36.6
Older colleagues' attracting young scholars for research by the grants and economic contracts	31.8
Creation of small innovational companies on the basis of departments	28.3

As to assessment of career perspectives in the scientific sphere, young scholars see their main advantage in science, as compared to older colleagues, the ability for effective adoption of foreign experience and achievements (55.4 %); ability to work intensively (48.1 %); mobility in the scientific environment (46.8 %).

Career growth of young scholars is an important factor in the process of formation of creative and professional qualities and their further adaptation and establishment in the scientific environment. Career growth, according to the respondents, is acquisition of scientific degree (55.6 %) and increase of the number of scientific works (20.2 %) (Table 4).

Table 4. Career growth according to young scholars.

Variant of answer		% of the number of the respondents
	Acquisition of scientific degree	55.6
	Increase of the number of scientific works	20.2

	Career growth	12.2
	Increase of wages	10.2
	Acknowledgement of scientific works in Russia / abroad	1.8

The image of modern science seems to be complex and ambiguous to young scholars. The basic characteristics have the following priorities: making money and commercialization (20%) and technologies (18.4%). At the same time, progress achieved with modern science is emphasized – 19.2%; new characteristics of the world science in the modern society is formed – scientific symposia and conferences, activities of international scientific groups, and creation of a system that can ensure joint creativity of representatives of science from various countries – 15.1%.

Young scholars' image of ideal science does not coincide with its classical images. Thus, its cognitive characteristics, which are the basic ideas of the respondents on ideal science, are absent. Active negativism appears due to one of the specific features of the world science – commercialization – which is doubtful and imposed from outside for the respondents.

The main reasons of such state of affairs in the Russian science, according to young scholars, lie in decrease of financing (89%), absence of smart and systemic policy of the state (50.8%), which leads to lack of demand for science and scholars (35 %), and "brain drain" (24.9%).

In their turn, respondents pay attention to the role of other factors, e.g., socio-cultural: they note decrease of the quality of education and such factors and lack of skilled specialists, decrease of prestige of scientific work and transformation of values, which leads to change of morality in the scientific environment and thus stimulates the disappearance of such moral type as "unselfish scholar".

Young scholars show understanding of domestic science as the most powerful intellectual component of the world science and as a brain factory for developed Western countries. The scholars also show concerns regarding future possibility for the West to subdue the Russian science and perform influence through provision of orders to Russian scholars or through turning Russian establishments into a platform for development of the Western scientific thought, which achievements will be implemented in Western countries.

The optimistic future of the Russian science, according to young scholars, depends on domestic factors: increase of its prestige (27.9%), financing (73.8%), and state support (17.9%). Only 0.8% of the respondents count on commercialization of science. Domination of the formula "if… then" with the respondents should be noted. According to the, if the state supports and finances science, the Russian science will have a future. 33% of the respondents show optimism in this regard, and 30.2% of the respondents show pessimism regarding the future of the Russian science.

Conclusions

When considering socio-cultural changes of the scientific community, it is necessary to note different dimensions of their manifestations. It is possible to distinguish two directions of the changes. Firstly, differentiation of the scientific community is expressed in differentiation of government structures, which allows speaking of the complex character of this process, which takes place at the individual and institutional levels, which covers separate scholars and scientific institutions. The second direction of socio-structural changes of the modern scientific community is differentiation as to the level of incomes. Low level of wages is the main factor of dissatisfaction with work of most scholars. Also, there is no opportunity to conduct full-scale research, which negatively influences the number of scientific personnel (Vodenko, Tikhonovskova & Ivanchenko, 2015).

The perspective directions of state regulation of formation and reproduction of scientific and innovational potential of the youth include the following:

– integration of applied science with production. Stimulation of this direction will allow increasing innovational potential of universities and developing sectorial science and scientific schools;

- development of the scientific infrastructure of universities;
- development of scientific and production connections of universities;
- development of the system of management in the scientific environment;
- increase of the level of provision with resources and of laboratory and technical equipment;
- increase of the level of financing of young scholars;
- development of the system of social provision and social guarantees for young scholars;
- creation of a positive image of scientific image and profession of scholar in society;
- involvement of academic staff in research activities.

There is a clear dependence between involvement of students in scientific activities and the emerging transformation of value orientations of future young scholars. Dynamics of research showed stable significance of such values and freedom of creativity, competence, social significance of professional activities against the background of reduction of the values of career perspective, conditions and material component of labor, and prestige in society and group solidarity in the work group. Loss of the large share of potential scholars has external character, determined by the economic, organizational, and socio-cultural conditions of research activities in a specific moment of time in the country, establishment, and work group. The measures that could raise the effectiveness of implementation of measures of state policy in the sphere of formation of scientific and innovational potential should include organizational, motivational, material, and social aspects.

Abstract

In modern conditions of global interaction, intimate knowledge of foreign languages by specialists in various fields is a prerequisite for carrying out professional activities not only at the national, but also at the international level. Determining economy as the main development direction of Russia, there is a need foreconomics students to be ready for carrying out professional activities not only in their native, but also in a foreign language. This, in turn, requires an accurate exteriorization of foreign professional (terminological) lexical units, taking into account the characteristics of a partner, a representative of another society, a bearer of other values, norms, concepts, another picture of the world. Owing to the national character, native and foreign professional thesauruses in many cases do not correlate.The article considers the potential of the intercultural approach, which allows economic university students, firstly, to perceive their native professional concepts peculiarities, therefore expand their horizons, realize their unique, nationally determined entity, secondly, to compare a native thesaurus with the foreign one to identify correlating and differentiating features. All this, ultimately, contributes to differentiation of two completely different professional thesauruses and provides conditions for improving the quality of business interaction between representatives of two different communities.

Keywords: thesaurus, professional terminology, concepts, intercultural approach, economics students.

Introduction

Globalization and integration process opens new opportunities, types and forms of communication, the existence of which is impossible without mutual understanding between different cultures (Birova, Vasbieva&Masalimova, 2017). Due to globalization, the result of which is the pervasive interconnection of people from different countries, where language is regarded as a means of communication and integration into global community, foreign languages teaching has become a vital issue for modern non-linguistic universities. The reason for growing concern is concentrated on the particular result ofevery contemporary education, which presupposes that future professionalsshould be able to tackle professional problems not only in Russian (native) language, but also in English.The ability to speak English forprofessional activities performing acquires ever-growing importance within the confines of *economic* university students(Kalugina et al., 2018), because economy was proclaimed the main area for country development. In view of the foregoing, there is a growing need in such teaching, which makes modern economic higher education institutions graduates able to solveprofessional problemsin a foreign language in the way they can do professional activities in their native one. What is more important, present language teaching should be aimed not at a foreign language itself, but at ESP where language is regarded as a tool of tackling professional problems(Kalugina, 2016; Vasbieva&Saenko, 2018).

An integral part of efficient speaking a foreign languageis for lexical aspect, which presupposes specific notions knowledge, various lexical units use and, more importantly,the ability to actualize required lexis, corresponding the communicative situation and thecommunication register. In terms of lexical side of thetarget language, the foregoing makes speech look natural and correspond to the accepted norms of communication.All things mentioned above necessitate a need of personality thesaurus formation, which implies a clear systematization of lexical units, the formation of links between concepts in a mental structure of a future specialist.

On the other hand, a communication between people from different societies impliesa kind of «clash» of two different pictures of the world(Tareva&Tarev, 2018), since the communication is carried out by bearers from two different social societies with their own norms, customs and foundations. Therefore, many concepts (and, accordingly, lexical units) from different pictures of the world do not coincide. Ignoring this peculiarity can lead to the fact that the future specialist will not be able to solve the communicative problem correctly.

This raises the question of how to ensure the learner's ability to understand, realizeand correlateforeign and native concepts to solve communicative tasks in the process of communication with a foreign colleague. The paper examines the difficulties of words learning and exteriorization, the advantages of the *intercultural approach*, which linguodidactic specificity in relation to a non-linguistic university is far from full-fledged scientific understanding and covering and which has a powerful potential for solving the issue of professional thesaurus formation.

Literature review

The problem of economic universities graduates training continues to attract the attention of researchers due to the fact that there are many unresolved issues in this area. One of the urgent problems is the insufficient formation of foreign lexical skills, allowing economic universities graduates to readily operate professionally significant lexical units (terms) in order to solve professional problems within intercultural communication. Today, students of non-linguistic universities are not able to fully use a variety of vocabulary which satisfies the communicative situation conditions and the register of professional communication. As scientists note, in the process of foreign language learning one of the difficulties economic universities students face is lexical units, especially vocational, and the reason for this lies in the insufficient development of modern foreign language teaching technologies (Pavlova, 2013: 48). The result of this is the fact that the students' speech looks unnatural, devoid of lexical variety, suitable flexibility, which does not comply with the accepted norms of communication(Vasilyeva, 2016: 68).

For the lexical side of a foreign language to be sophisticated enough, there is a need for introduction of innovative technologies (Kalugina&Tarasevich, 2018; Kulamikhina et al., 2018; Tastan et al., 2018), meeting the current requirements and allowing the future economist to master the vocational vocabulary and ensure the quality and effectiveness of professional communication. The use of a thesaurus dictionary is one of such new technological solutions. This means allows the learner to form the meaning of words not only with the help of the definition, but also through the correlation of lexical units and their categories. A thesaurus provides systematic memorization of lexemes, forms connections and logical dependencies of concepts in the process of the student's active cognitive activity, who in the future will be able to actualize the acquired knowledge and skills in relevant situations, conditions of communication. Thus, the use of such a dictionary can contribute to future specialists' professional thesaurus formation.

Thesaurus is devoted a lot of research in various fields of scientific knowledge. In linguistics, the thesaurus level of a linguistic personality is distinguished, his/her language abilities and properties at this level are revealed (Karaulov, 2010). A "model of secondary linguistic personality" (Khaleeva, 1995) was developed, in which thesaurus features are given a defining place. Research works by M.E. Korovkina (2015), Yu.S. Fomina (2011) and others allow us to find out the place of the thesaurus level in the structure of individual's intellect, how concepts (the pictures of the world) are formed in the mind of a linguistic personality, what relations between lexemes can be established, andalso they determine principles oflexical unitsselecting.The above-mentioned sources have made an invaluable contribution to the study, since they allowed to determine that there are 3 levels in the structure of an intellect, and the thesaurus is the key phenomenon here. Taking into account the fact that relations between lexical units at the thesaurus level are arranged in an *orderly, strict* hierarchical system, expressed in lexemes, definitions, aphorisms, feathered words, proverbs, sayings(Karaulov, 2010: 52), all scientists agree that at this stage individual's thesaurus reflects, first of all, the structure of the *world*. This level is not as mobile and individual as the second, motivational,this leads to the conclusion that the likelihood of *influence* at thesaurus stage of concept formation is great because the thesaurus initially reflects the consciousness of the society and only then is interpreted through the prism of personal experience. Such studies confirm the *possibility* and necessity of professional thesaurus formation, before the students form correlations in their mind incorrectly.

From the perspective of psycholinguistics, the main object of consideration is the relationship between the internal lexicon and the thesaurus of an individual. The research works by scientists (Akhutina,2014; Zalevskaya, 1999; Aitchison, 2003; Collins & Loftus, 1975; Garman, 1990; Levelt, 1989; Bierwisch, 1965; Fillmore & Atkins, 1992;etc.) help to identify the relationships between lexical units at different levels of human mind, the principles of words search in memory, as well as mechanisms of speech production. All researchers distinguish different types of lexical units' relations, the most common are:

- on the basis of categories of knowledge, uniformity, associative proximity(Zalevskaya, 1999);
- semantic relations(Collins & Loftus, 1975);
- based on the form of the word or semantic associations(Garman, 1990);
- on the basis of syntax, morphology, meaning, phonology or associations relations (Levelt, 1989);
- linguistic and non-linguistic level associations (Bierwisch, 1965);
- associations relations based on already existing in the mind frames (Fillmore & Atkins, 1992).

Despite distinguishingdifferentlexis connections, all researchers agree that all units of mental lexicon are not located separately, but necessarily combined with each other. At the same time, to verbalize the necessary lexeme there is a word search within the framework of semantic networks of lexical units stored in memory and forming concepts. All mentioned above points out the importance of a thesaurus as part of the individual intellect formation, the need to form*accurate* connections in the mental lexicon to ensure the correctrelations in structural hierarchy inmindand, subsequently, to verbalize the necessary information properly.

Serious difficulties are in the way of those who study the process of individual's foreign professional thesaurus formation. When studying this process, scientists are faced with predicaments that are difficult to overcome due to the fact that thesauruses of the native and foreign languages in many aspects do not coincide because of significant discrepancies in the cultural characteristics of different communities. In cognitive linguistics, it is proved that the system of knowledge about the world includes many concepts (fixed representations associated with various objects and phenomena of reality) of different levels of complexity and abstraction, formed in various ways (Shcherbina, 2008: 19). In order for new meanings to appear in the mind of an individual, a *conceptualization* process, which is responsible for the formation of new concepts, conceptual structures, conceptual systems, takes place and *categorization*, which implies comprehension and correlationof new information with existing categories [ibid.]. Modern understanding of categorization proceed starts with the fact that there are "basic" and less significant categories within different existing categories; at the same time, the basic categories of different societies will differ from each other due to discrepancies in the way of people's lives (Rosch, 1978). In other words, representatives of different societies will have different basic and minor categories. In this case, not only the order of systematization of categories may differ. The national specificity can be also shown by the fact that some connotates of a lexical unit will be more important and "brighter" in one culturethan in another one (Sternin, 2016: 51).

It follows from the above that any foreign language lexical unit is perceived by the recipient through the prism of the cultural representations of the native society, which can lead to incorrect memorizing and fixing in the mind of a student distorted information relating to one or another lexical unit. There is a high probability that such a foreign vocabulary will be fixed in the student's mind, the meaning of which will be perceived from the point of view of the native picture of the world, which will lead to an incorrect use of the word in a foreign language professional communicative situation. "A person is not inclined to notice these phenomena and things that are outside his ideas about the world" (Maslova, 2004: 49), and this means that the knowledge included in the native picture of the world is stable, and a person with obvious difficulty fixes new ideas about already established objects and phenomena.

Solution to the problem

The presence of different conceptual structures, the difference of the most significant connotativemeanings of lexical units' indifferent societies' minds reveals the necessity of comparing native and foreign-language thesauruses for a better understanding of the latter. The need for connotates differentiation is connected with the peculiarities of a picture of the world formation. Due to the fact that in the mind of an individual there are already existing concepts, on the basis of which aperson perceives objects and phenomena (through his native picture of the world), the study of a foreign thesaurus restricted to a demonstration ofanother society cultural concepts, does not allow to automatically gain foreign cultural knowledge. In order to avoid a merge of native and foreign professional thesauruses in the student's mind, it is necessary to form a foreign thesaurus in the framework of an intercultural approach. It will allow the future specialist to get integrated knowledge based on a comparison of the native and foreign pictures of the world and, thus, at their crossing and mutual enrichment he will understand his/ her unique (nationally conditioned) entity.

This didactic strategy (intercultural approach) is widely studied in Russian and foreign linguodidactic research works(Khaleeva,1995;Tareva, 2017; Bennett, 2004; Corbett, 2003;Byram, 1997;Kramsch, 2011). The main feature of this approach in reference to teaching lexical side of a foreign language is related to the fact that language in this case becomes a means of professional cultures dialogue and an effective tool forprofessional intentions realization associated with interaction with a representative of another culture, country, or another society (Dikova, 2008: 281). When studying a foreign language and learning the characteristics of someone else's behavior, the student expands his picture of the world, rethinks the characteristics of the native culture through the study of foreign cultural characteristics. At the same time, which is fundamentally important, the pictures of the world (native and foreign) are in an equal position, which allows to *avoid dominant ideas* about objects and phenomena of professional reality, the thesauruses begin to enter into equal relations of a "dialogue" (Tareva, 2017).

The use of the intercultural approach is especially significant for teaching students' professional terminology, since the diversification of the native and foreign conceptual and terminological apparatus,connected with insufficient correlation and differentiation of native and foreign pictures of the world, can be a reason for negative consequences of communication. The intercultural approach helps to eliminate insufficient knowledge gaining, which arises from studying *foreign* lexemes through the prism of the *native* picture of the world, because this approach is based on a comparison of native and foreign thesauruses, differentiation of distinctive cultural features of considered lexical units.

Methods and materials

In linguodidactic system a thesaurus dictionary, built on the principles of the intercultural approach, becomes a means ofteaching lexical side of a foreign language. Such a dictionary is responsible for the substructures of the student's mind and forms the student's professional picture of the world (thesaurus) (Zalevskaya, 1999). The dictionary is organized around a central concept, it (the dictionary) reflects the connections and relations between lexical units, considers cases and stable expressions used within the topic being studied. In other words, a thesaurus dictionary is a verbal product, showing the way lexical units should be organized, stored and interacted in the mind (mental lexicon) of the student. The undoubted advantage of the thesaurus is that the information presented in it is carefully selected, schematic, and visual. The lexis is presented in the form of semantic networks, which, in turn, help to systematize knowledge, establish relations with existing concepts.

From a methodological point of view, the potential of the intercultural approach for the economic universities students' professional thesaurus formation will be carried out by presenting *native and foreign thesaurus dictionaries* to students as a means of forming professional *concepts* in students' minds.

According to A.V. Shchepilova (2005: 140), in order for the student to understand differences in the ways of expressing thoughts in a foreign and native language, the "open comparison" will be the most effective. Moreover, students under the guidance of a teacher should carry out such a comparison. This means that for accurate foreign lexical units learning when applying a thesaurus dictionary built on the principles of the intercultural approach, specially organized thesaurus training is needed. In addition, the best way to achieve accurate understanding is based onthe use of *anexplicit comparison* of native and foreign thesaurus dictionaries.

The thesauruses themselves are not so informative, since their demonstration to the students is not a guarantee that all relations between lexical units will be formed correctly. Economic university students' professional thesaurus formation needs specially organized teaching methods based on a comparison of these two thesaurus dictionaries.

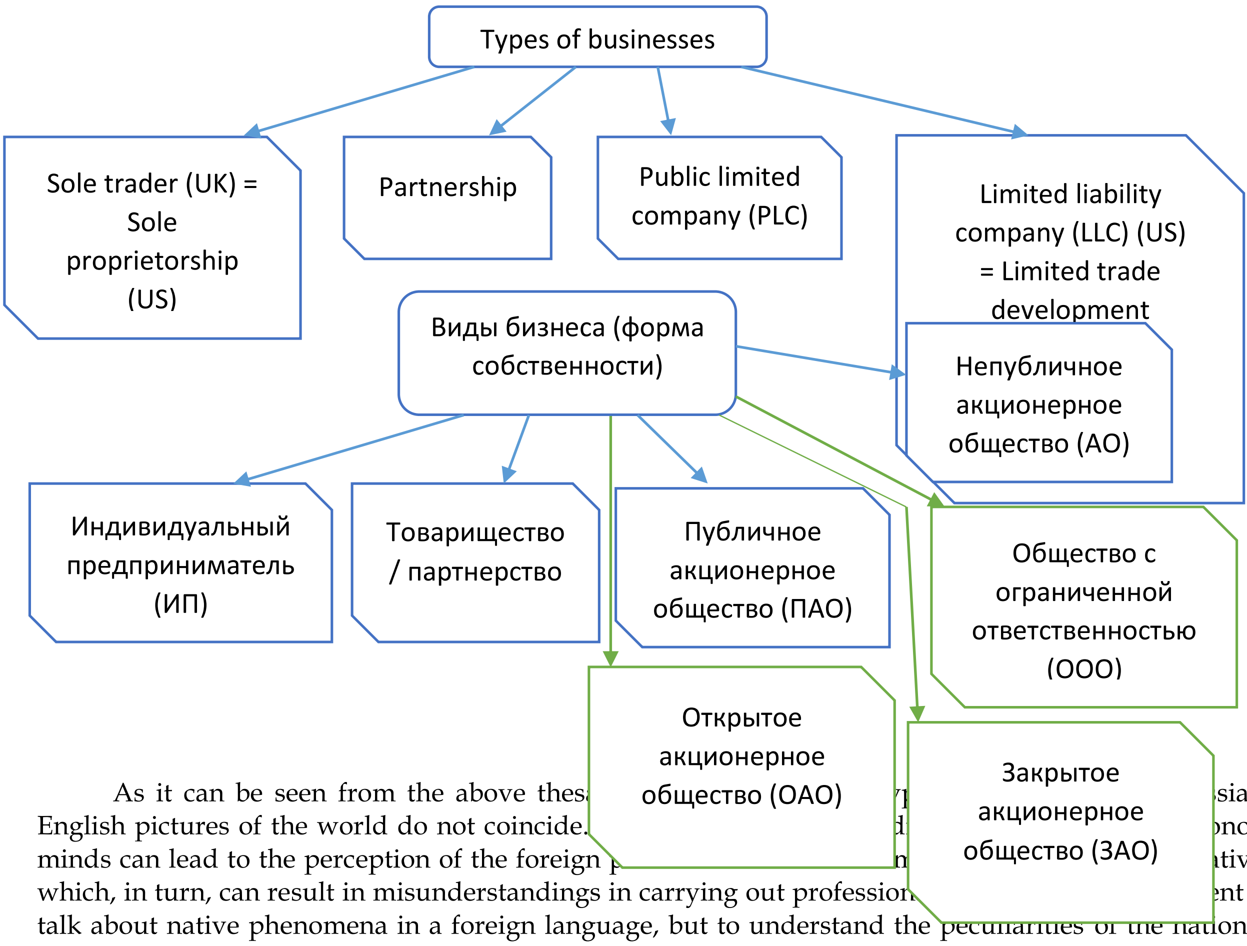
From methodological perspective,in the first stage a teacher should provide the students with a detailed description of the thesauruses.For students to achieve accurate understanding of the studied concepts, the second stage is for thesauruses training, which can be implemented by doing such exercises as gap-fill tasks, native and foreign concepts description, filling in the texts' gaps with information from the thesauruses, power point presentations (with particular examples: companies, products and etc.) preparation and others.

Results and discussion

In a generalized form, a formation of a thesaurus in the framework of the intercultural approach can be demonstrated by considering the classification part with the main topics and subtopics of thesaurus dictionary logical-semantic structures.

A good example demonstrating the need to study lexical units in an economic university in the framework of the intercultural approach is the consideration of proximal space of such a category as "types of businesses". This topic is one of the first / introductory in the foreign language in the professional field class.

Figure 1. The classification part of the thesaurus dictionary based on the intercultural approach in the semantic field of "types of businesses"



As it can be seen from the above thes… sian and English pictures of the world do not coincide. … onomists' minds can lead to the perception of the foreign … tive one, which, in turn, can result in misunderstandings in carrying out profession… ent not to talk about native phenomena in a foreign language, but to understand the peculiarities of the national and foreign identity, there is a need for the intercultural approach to be implemented into the learning process. Vocabulary developing within the intercultural approach, entailing external differentiation and correlation of native and foreign concepts/ thesauruses, helps students to realize their *unique* cultural essence, understand, comprehend, and accept cultural dissimilarities of different linguistic communities for obtaining *integrated* knowledge about the phenomena studied.

Meanwhile, it should not be forgotten that thesauruses themselves are not so informative, therefore there is a necessity to identify the main distinctive features of the native and foreign concepts "Types of businesses". It is generally agreed that the common model of business types is the following:

- a sole trader;
- a partnership(UK)/ a sole proprietorship (US);
- Limited liability company (LLC) (US)/ Limited trade development (Ltd) (UK)/ Private limited company (UK);
- Public limited company.

Equivalents for the first two lexical units are obvious – индивидуальный предприниматель (a sole trader), товарищество/ партнерство (a partnership). As for the last two terminological combinations, their interpretation requires comparing them with the national (Russian) economic specifics. It goes without saying that under the influence of globalization there were transformations in the understanding of such a phenomenon as business types, and their classification changed accordingly. On the other hand, the simple (primitive) definition of the concepts "Limited liability company" as "Непубличное акционерное общество", "Public limited company" as "Публичное акционерное общество" does not allow a student to understand a place of such phenomena as ОАО, ООО, ЗАО in the thesauruses. Despite the fact that these types of businesses are outdated and gone from the official turnover, they "live" in the society mindset and are in demand in the national economic consciousness even among modern youth.

From the perspective of professional practice, a need to differentiate the regarded phenomena may arise when trying to start a business with a foreign colleague. In this communicative situation, misinterpretation of the business type can play a key role, that is why there is a need to classify business types in Russia and to identify relating and differentiating features of business types in Russian and English pictures of the world.

As it can be seen from the ideographic part, thesauruses themselves are not informative enough for students to form correlations on their own, therefore students' professional thesaurus formation in the framework of the intercultural approach should be with a teacher's assistance or under his guidance, in addition, special training with well thought-out methodological system is needed.

Conclusion

The presented view on the problem of students' professional thesaurus formation is innovative, since the object of consideration is concentrated not on the skills of thematically related lexical units operating, but onthe foreign professional pictures of the world formationwithin an intercultural approach, which, in turn, takes into account the cultural peculiarities of the native and foreign societies. Such an approach allows students not only to understandthe sense of thematically combined lexical units, not only to use words which correspond to the situations of communication, but also to note the connections and dependencies between the conceptual rows of two thesauruses - native and foreign. Such a comparison is based on the principles of the intercultural approach, which allows to study the interaction of different professional concept spheres (thesauruses), comprehend information about a foreign world picture in its comparison with the native one on the basis of explicit differentiation and correlation. The introduction of the intercultural approach will make it possible to rethink already existing in consciousness and perceived through the prism of the native picture of the world concepts, to make the thesaurus of a language personality more systemic, developed and deeply aware.

The results of the research are the basis for further investigation of distal space of the semantic field "Types of businesses", full thesauruses (with 4 parts) on this theme design, creation of methodological conditions in the form of exercises for thesaurus lexical unitspractice. The findings of the research and the ideographic part of the created thesaurus can be implemented in the educational process at English lessons for accurate economic university students' professional thesaurus formation.

Abstract

Research topic relevance is grounded on the lack of high quality supply market segment alongside with the evident food quality deterioration on the market. Formation conditions of the segment are complicated and demand deeper level of knowledge. That can be defined as a ground for the article to be aimed at determination and justification of reasons for this market segment formation not being in growth but resolving instead together with continuous food quality deterioration. Methods of SWOT analysis, five factors of the industry market, product life cycle, and market institutional organization competitive environment analysis were used during research. Trends and reasons of processes on industry market and the segment researched were determined and justified during analysis. All market competitive factors, acting and new coming companies, suppliers and consumers are focused on production and circulation of low quality goods: consumers because of low income while producers because of fast growing expenses. As a result the market becomes filled with degraded quality substitutes. Big distributors dominate in selling food due to profitable price policy and monopolistic market position. There is a lack of effective institutional market organization. Necessity of food market organization modernization with the aim to create formation conditions of high quality food market segment and strengthen institutional controlling and regulating structures is grounded in this research. Theoretical significance of the research lies in the fact that achieved results improve knowledge on industry market competitive factors. In practice achieved results can be used for competitive relations regulation and high quality food market formation.

Keywords: food market, food quality, competitive factors, market environment, monopolism, distributing facilities, institutional organization.

Introduction

Research topic relevance was predetermined by sustained trend of produced and sold food quality deterioration and high-grade, high-quality food disappearance from market turnover. The market becomes filled with food produced with low-quality food and non-food fillers and genetically modified products. There is no possibility to identify product quantity and determine its usefulness on information provided by producers. Choice and consuming conditions for meat, milk, fish and bread, vegetables, fruits and canned products have become unacceptable.

Such situation usually stimulates creation of alternative market segments with a wide high-quality food choice. Representatives of small and mid-sized business enter this market segment in agricultural regions as they can provide production and sell of organically clean and genetically full food. From time to time they have been appearing in Volga region but could not stay for a long time. Formation of this segment is terminated for today. Obviously this problem has objective and subjective background which shall be determined for the problem affecting sustainability of social food safety be solved.

Based on the above the aim of the research is determination and description of competitive relations peculiarities on food markets with the following characterization of current formation conditions of high quality food market segment and measures justification for institutional ordering and sustained functioning of this market.

The following tasks were solved during research: competitive factors analysis on industry market with determination of their system interconnections and intercommunications; characterization of current formation conditions of high quality food market segment; justification of necessity and description of obstacles preventing regional producers enter this market; justification of necessity for food market institutional organization improvement.

Methods and Materials

Methods of five factors of the industry market were applied (Porter, 1985). Adapted to theme method of SWOT-analysis (Grant, 2008) allowed estimating possibilities on industry and inner environment, their actual usage, reasons of usage and allow measures on increasing regulation efficiency. Threats appearing on industry market environment and on production factors market were also characterized. Degree of domestic producers' security from threats is estimated, sources of threats are discovered, and steps on improving institutional rules, restrictions and sanctions producers' security are given.

Results

The analysis made proves formation of high-quality, ecologically clean and genetically full food market segment aiming to strengthen and guarantee social food security as the main task of economy. This segment has not formed yet as there are no economical and institutional conditions for that. The analysis of five competitive factors on food market revealed peculiar nature of this market competition (Porter, 1985). This competition is not based on price and quality indicator but exclusively on price and costs. Quality indicators are hidden and do not play a vital role on market as consumers have lack of knowledge on cheese (cheese product), meat (meat product), and a number of other food products quantity. Producers have an opportunity to hide quality and use profitable price policy manipulating costs (decreasing them by adding cheap fillers in a product).

The analysis of five competitive factors shows the first factor, firms being on market for a long time are on specific positions. From one side they represent large, middle and small business making food. From the other side they represent both buying and selling business with dominating trading chains having competitive advantage. The source of this advantage is a monopolistic power of oligopolies controlling together both volume of purchases and price policy. They have no necessity to go into a huddle for that, they can just monitor other's price and food policy. The majority of firms producing food are representatives of middle and small business. They are not free to choose their own price and food policy as large trading chains dictate them own terms and sell own goods many times more expensive than pay producers. Being on such a distorted position they use ingredients which worsen food quality but improve (or, at least, not worsen) its design. That is the ground reason for permanent food quality deterioration. Trading chains gain excess profits while food suppliers also do not wish to stay at a loss. What is more small business competitive position both among producers and suppliers and retailers stays weak. Trading chains have little interest in working with them because it leads to higher transaction costs and time losses (Tumalanov & Pavlova, 2015).

The second competitive factor on food industry market is new firms entering this market. Entering process usually becomes more active on the growing stage but nowadays when this stage is inactive this process is weak. There are a lot of cases when small business representatives entered this market segment but they did not stay long and left it. Some tried to enter big cities markets, Moscow and Kazan particularly. But there they also suffer from difficulties as costs, especially transaction, are high. Moreover they do not know a lot of information necessary for new producers and sellers. Goods life cycle on market is sluggish (Tumalanov & Pavlova, 2015). There can be years passing before the beginning of growth cycle. Signs of future growth are necessary to be known. Redistribution of the existing volume does not happen even with the market growth. As a rule, only adding volume is going under redistribution (Tumalanov et al., 2017).

These circumstances can lead to high-quality food market stagnation unless positions of existing and new firms turn to be better. Any firm trying to enter this market unless market conditions are favorable falls under effects of "misconceptions". If there are not many sellers (producers) on market, demand exists, prices are attractive, entrance seems to be profitable. But entering firm does not pay attention on a creeping food prices growth, absence of consumers' income and entrance of other firms. This leads to the situation when this firm faces increasing costs, decreasing demand and lowering prices for own product.

The third competitive factor is food suppliers systematically increasing prices. This tendency remains despite efforts of regulating state institutions trying to hold price increase last years. That is the reason for increasing costs for producers. As usual they try to cover these costs by minimizing salaries. However this hint does not help to improve goods quality as producers have to hire unskilled workers with no diligence and capacities. Such state with food suppliers and workers does not help to create high-quality food market segment. On the opposite, impossibility to lower costs or, at least, keep them on previous level forces producers to turn to the second powerful (after lowering costs) way of increasing (or keeping) competitiveness which is a product differentiation.

Now we came to the results of the fourth competitive factor analysis which is substitute goods producers. The analysis witnesses that there is one common category for notions substitute goods producers, product differentiation and diversification. Differentiation is production of new kinds of product with new quality indicators (Porter, 1985). These indicators are not obligatory better, at least, no one speaks directly about it. Diversification is a passage to production and distribution of new products (Olusoga, Mokwa, & Noble, 1995). On the majority food market segments studied by us the fourth competitive factor, substitute goods producers, is presented by firms and companies producing and distributing so called meat products instead of beef, pork and other meat types, milk products instead of milk and so on. This process fully matches competitive differentiation and diversification but not normal consumers satisfaction. All market gaps are filled by these quasi products. There is only one explanation for market self-regulating mechanism blindness to this. Only one development direction is possible for non-regulated or ignorant and limp regulated market which is profit maximization. Product falsification making possible its differentiation and diversification in accordance with the theory of competitiveness allows profit maximization (Grant, 2008).

This process continues. Differentiated substitutes, quasi products do not allow real products with natural qualities occupy own market segment and even oust them from market. Not far ago market was full of enthusiasts trying to occupy and keep (or increase) market share. Today they are leaving market. It is extremely hard, almost impossible to achieve competitive advantage due to costs leadership and quality keeping in modern conditions.

A consumer goes to the main stage as the question appears "what is the situation with the demand for high-quality food?"

The analysis of the fifth competitive factor, consumers position and behavior, is usually executed with the aim of getting closer to the competitive advantage by creation of value (number of values) for a consumer. Segmentation on consumers groups is used to achieve best results in analysis (Fleisher & Bensoussan, 2005). Plus the idea of aggregated demand curve existence is rejected (Smith, 1995). Consumers segmentation allows to disaggregate demand schedule and consider many demand curves. This position also allows to consider food market as a model of imperfect competition with own demand and supply curves in each consumers segment. Such approach can help to explain market peculiarities in globalization. Rapid growth of offer and income in global economy leads to new segments where rich consumers claim high-quality products. Demand exists and grows if market with its institutions is well organized. Any firm with unique resources can define consumer groups ready to pay more for satisfactory product qualities through sectional analysis of consumers demand.

This orientation cannot obligatory bring high profit. The main reason for that is a distribution market constriction and high costs due to necessity of giving up the effect of industrial scale. That often defines as a reason for a little number of those wishing to enter and settle in such segments. What is more risks and uncertainty are high on domestic market. It is obvious for today that only rare firms have opportunities to take such risks when low income rate and corresponding paying capacity are well known for everyone. And their rapid increase and consumers' activity revival are not expected. Average income rate equal to 42,000 RUB and long-term credit burden taking most part of such low amount of money from dozen million citizens do not reassure about growth and development of high-quality market segment.

The analysis of this market segment in our region shows deep traditions of agricultural production in Chuvashia which can help it to occupy corresponding high-quality market gap. Works in this sphere are going actively nowadays. It can be proved by Oldeevskaya agrofirm activity. The firm built barn for 414 heads, started construction of milking and dairy unit for 120 cows in Krasnochetayskiy district. Novocheboksarskiy greenhouse complex for 22 ha on the high-tech basis of the fifth generation, new objects of the agricultural and food processing industry have being constructed in Batirevskiy district, etc. However, it cannot be assumed that the general trend of deterioration in food quality has bypassed the region's food enterprises. The analysis of the sectoral market environment shows that there are significant possibilities for high-quality food market development in the region, but they have not being fully used yet (Table 1).

Table 1. Summary of the results of regional high quality food analysis

Factors of existing opportunities	Significance (in shares from unit)	Estimation of current condition	Average weighted score	Factor's real usage	Reasons of factor's non-usage	Supportive measures
1	2	3	4	5	6	7
"A" Opportunities						
1. Usage of agricultural land	0.15	4	0.60	There are not used agricultural lands	Results of usage do not satisfy small and middle business.	Stimulate results increase by manufacturers support mechanisms.
2. Free workers	0.15	3	0.45	There are free workers but little used.	Employers are not satisfied with workers qualification.	Increase the quality of staff training and level of wages.
3. Investment opportunities.	0.20	3	0.60	There are investments made but their growth rates do not satisfy industry demand.	Investors are not sure in payback periods of high-quality food capital.	Create and use flexible system of this industry segment's investment attraction increase.
4. Demand increase on high-quality food.	0.10	1	0.10	Factor is rarely used due to consumers' inactivity.	Low income and weak population purchasing power.	Stable population income increase can provide system cooperation between state, business, labour

						unions and banks.
5. Export and sell on other regions markets.	0.10	3	0.30	There is export on neighboring regions markets. Global export without government support is complicated.	Absence of government export stimulation.	Stimulate and support damping export by subsidies. Number of developed countries use this practice.
6. Implementation of high-tech technologies in production and distribution.	0.10	3	0.30	Transition to high-tech technologies has begun not far time ago.	Trend to cut costs by ignoring product quality.	Cooperation between government, business and workers in the sphere of high-tech technologies implementation.
7. Availability of workers.	0.15	4	0.60	Hire workers on low wages condition taking unemployment into account.	Underestimation of workers. Overestimation of business. Instability of common price level.	Strengthen government and trade unions control and sanctions for employers dishonest in labor compensation.
8. Good quality food market organization and regulation.	0.05	2	0.10	Market is not organized. Restrictions and norms are not clear. Sanctions used rarely and ineffectively.	Absence of strict rules and restriction norms undermines opportunity for this market organization.	Systematic rules and norms organization with usage of digital economy achievements.
Total opportunities indicators	1.0	2.9	3.05	Level of opportunities usage is average.		
"B" Threats						
Threats appearing				Security level	Source of threats	Steps taken to strengthen security
1) Supplies level and conditions (prices, quality and stability of supplies) are	0.20	4	0.80	Insecurity before supplies rapidly growing prices, quality decrease and instability.	Ineffective control, regulations and sanctions.	More dynamic and flexible regulation, control and sanctions.

getting worse.						
2) Price increase on oil-chemical products, gas and electricity.	0.20	3	0.60	Security is weak nowadays.	Plain tariff policy. Unlimited monopolistic power of corporations.	Improvement of tariff and ant monopolistic policy.
3) Lending difficulties (high interest rate, complicated conditions, and additional bank requirements).	0.05	4	0.20	Security is complicated and weak.	Inflexibility of money-credit policy, banks abuse of their market power..	Regulating policy differentiation for different economic sectors. Institutional restriction of banks market power.
4) Decrease of workers qualification and competence level.	0.15	4	0.60	It is a common trade. Activities are currently implemented to overcome this common trade by increasing workers training level.	Problems in training system of additional workers education.	Improve process of additional education.
5) Domination of trading chains and their monopoly and high concentration in food trade.	0.20	4	0.80	Permanent food price increase, low food quality which lead to monopolism.	Imperfection of anti-monopolistic legislation and policy corresponding.	Improve anti-monopolistic legislation and policy of FAS and other institutions taking into consideration real state of things.
6) Foreign low quality products appearance.	0.05	2	0.10	Customs barriers and restrictions are overcome illegally.	Import through illegal ways.	Take legal measures and corresponding steps against unauthorized import.
7) Low quality food market domination.	0.05	4	0.20	Food quality is getting worse. Measures taken or not do not bring to strong results.	Low threshold of food quality norms and standards. Low control on their execution.	Information on product quality and quantity should be reliable, understandable and available. More effective

						control and sanctions.
8) Demand for high-quality food can be lowering continuously.	0.10	4	0.80	That will happen if real population income would be decreasing. Its increase solves this problem.	Indexation is executed only towards pensions and public workers' wages but it is still inadequate.	Execute indexation adequate to real state of economy and common price changes.
Total threats indicators	1.0	3.6	4.10	Threats level is high.		

Note: Table is made from results of empirical research of competitive factors on food market and adapted to research theme out of table 6.1. on p.78 of "Firms and industry market: strategic analysis" study guide by N.V. Tumalanov (2007). Cheboksary: Chuvash state university publishing house.

Investment of industry, however, is generally increasing and qualitatively improving. Low population income and correspondingly weak demand are the main obstacles for high quality food segment formation and successful development. Other four competitive industry factors are also in the same interconnections and relations as those of a country.

The analysis also shows that threats for the following food quality deterioration are quite significant. Such threats can be both manufacturing production prices growth and complications in getting loans for improving staff qualification. Trading chains merging with each other strengthen their market power getting income often equal to costs without that. All that leads to wider distribution of low quality substitutes. And all competitive factors and their interconnection promote this situation.

Discussion

Widely used five competitive forces model of M.E. Porter (1985) is universal. Both opportunities on SWOT-analysis factors and threats are mainly connected with it. Despite doubts in some of its aspects (Black & Boal, 1994) it remains to be a leading method. Analysis of market segmentation from the perspective of consumers has special meaning in choosing production and selling strategy (Ries, 1992; Duboff, 1992). If we take into consideration W. Smith's (1995) point of view, we should disaggregate demand schedule as each group of consumers has its own demand curve. Perfect competition model is not suitable for explaining such kind of market. Firm and industry development strategy should use differentiated approach to each group of consumers which means that each group should have both own demand and offer curve. This refers also to high quality food consumers and this segment development strategy. Producers should have corresponding competence to enter this market segment and compete successfully. This competence does not consist of external circumstances but internal key competitive factors (Prahalad & Hamel, 1990). More specifically advantages for a firm from usage of key competences are explained from financial point of view (Mahoney & Pandian, 1992). Authors described four types of economic revenues providing stable financial position and competitive advantage.

1. Income from valuable sources, ricardian revenue.
2. Income from market power mechanisms (patents, barriers for entering firms, secret agreement and other illegal actions of the same character).
3. Income from innovations and risks (entrepreneur's revenue).
4. Income from specific firm's sources (quasi revenue).

State support and effective competition development policy are very important for firms entering this market segment (Aleksandrov, 2015). That provides market exploration and firm's market position. Institutional restrictions, norms and rules are vital in modern conditions of market relations globalization (Kharlamov & Skodinskiy, 2015; Tumalanov & Urusova, 2016). For researched market they should be notably rational, strict and flexible at the same time. In that sense membership of Russia in WTO brings significant limitations for the opportunity of institutional support of Russian (including regional) producers (Tumalanov, 2007). These WTO limitations should be leveled. In other case agriculture especially seed production and breeding can fall under foreign companies control (Tumalanov, 2007).

Conclusion

1. The research proved that high quality food market formation and functioning answer interests of government and society. That increases level of food and economic security, has positive influence on demographic processes and supports flexibility of food policy.
2. Additional opportunities for small and middle business of agricultural and processing industries to enter this market and widen their share n it appear. Industry producers can count on a favorable position on production factors market and getting the necessary labor, land resources at a low price on it and organize the release of clean, not genetically modified products and create a competitive advantage by improving abilities and competencies. This production has good prospects and can soon enter the stage of intensive growth.
3. Factors preventing formation and growth of this market are discovered. It is still not institutionally organized. Restrictions, norms and rules are fuzzy. They are strict mainly to the technical side of production but not to deceiving consumers and product falsification. Control is executed ineffectively. Measures preventing production and selling of low quality production are soft and weak. Competences of firms needed for high quality production are insufficient. Mostly low population income and insufficient paying capacity prevent this market formation from side of demand and consumers.
4. Large trading chains are dominating on food market. They use their strong market power and get over income. That is the reason for their economic interests not being in the sphere of product quality improvement. New coming medium and small firms fall into a complicated position caused by increase of costs and unreliability of suppliers. They also have to switch to low quality production. As a result of these negative factors, elements of high quality food market are shortening and

disappearing.

5. Opportunism of institutional structures and institutional imperfections do not allow this market to self-identify and become independently developed on the stage of growth. Government structures responsible should use new approach for this market organization and regulation as it has special importance for food security. Anti-monopolistic policy needs to be tighten by granting more opportunities and power to corresponding institutions, revising legislation, quantity, rights and responsibilities of executors.

That leads to the whole industry concentration only on substitutes and quasi-food and termination of normal food production.

Recommendations

Results of this research can bring a significant usefulness in implementation of regional agricultural complex development strategy and improvement of organizational structures institutionally providing effective functioning of this market and regulating competitive relations.

The study is carried out with the financial support of the Russian Foundation for Basic Research (RFBR) in the framework of the research grant No. 18-410-210002

Abstract
The exploration is gone for the investigation of the arrangement of the associations between the procedure of ethnic individuation and ethnic personality, resilience to vulnerability and multicultural condition. 325 Ukrainians matured 24 to 56 took an interest in the observational research among which 23% individuals were with optional training and the rest – with advanced education. Among those under examination there were 175 ladies and 150 men. With regards to the statistic attributes every one of them lived in various urban communities, towns and towns in extent average of the statistic creation of the number of inhabitants in Ukraine. The accompanying techniques were utilized: an authorial survey on the instruments of individuation, top to bottom meeting, Budner's Size of Resilience – Narrow mindedness of Vagueness and "Ethnic Character" by H.V. Soldatova. It was discovered that prejudice to insolvability urges to arrangement of the troublesome errands, enactment of such instruments as acknowledgment, allotment, aesthetic inventive completion and separation. Narrow mindedness to the intricacy of the world to some degree muddles the elements of specific systems of the ethnic individuation to be specific allocation and coordination in this way supporting appearance of new components.
Keywords: Individuation,multiculturality, ethnic identity, tolerance to uncertainty.

Introduction

1.1. Articulation of issue

Within the post-dynamic approach a number of studies were conducted focusing at the problem of individuation. However, most of the studies were investigating fairytales, myths, narrations created by the clients. That's why there appeared a necessity to develop and approbate psycho-diagnostic tools for the research of the process of individuation, its factors and mechanisms. This study is especially focusing at the process of ethnic individuation, its connection with tolerance to uncertainty, multiculturality and ethnic identity.

1.2. Previous Research Analysis

Following the definition given by C.G. Jung (1954), a founder of the research devoted to individuation, it is a process of achievement of the internal unity with Self and the whole humanity. A core idea of the analytical psychology is a notion of individuation that is defined as a process of establishment that enables a person to realize his/her internal potential to the fullest. Within the framework of our research it is important to notice that individuation makes it possible for a person to feel a connection between his/her in-depth motives and get engaged in the social and cultural context as much as possible. Following and complementing the conception of G. C. Jung, J. Atwood and R. Stolorow (2016) stated that the aim of individuation is an establishment of a stable self-representation. They highlight three basic elements of the process:

- recognition;
- performance of the transcendental function;
- drawing a boundary line between personal and collective contents thus providing the contact with universal topics.

M. Fordham (1976) and E. Harding (1965) consider the process of individuation from the perspective of the archetypes and collective unconscious. Living through this process a person is supposed to find his/her personal interconnection with archetypical images, feelings and behavioral models. Step by step a person starts identifying something that can be classified as his/her personal and something that was passed down from the depth of the ages. Consequently, life gets an inexhaustible sense of purpose as it is not dictated by the outer requirements but rises from the depths of the internal source.

Within the framework of the modern analytical psychology there are studies aimed at the research of not only sources of individuation but of the dynamics of this process too.

Representatives of the school of development believe that the process of individuation starts in the childhood and differentiates between five separate stages of development of consciousness (Lambert, 1981). At the first stage consciousness identifies itself with environment without realizing its body and personality. At the second stage Self separates itself from the environment and other people and at the same time Big Figures of Mom and Dad are identified. At the third stage the fact that projection and its objects are not identical becomes clear. The projection of the timeless values gets separated from the image of Big Figures and is being «transmitted» in the system of religious and philosophical believes. At this stage are the people with religious worldview. At the fourth stage the place occupied by faith is desolated and the decisions are made with an account for the pragmatic and realistic worldview. At the fifth stage subjectivity, reflection and realization develop actively and this leads to the integration of the conscious and subconscious aspects of Self.

M. Stein who is a representative of the School of Development (Stein, 2009; Stein, 2010) in her research points to the existence of two more stages besides those described above. They appear after personality integration. Thus, at the sixth stage a sense of unity of psyche and material world is formed and the seventh stage is typical only of some personalities namely those who achieve the stage of augmented cognition and going into the depth of the collective conscious. Modern Ukrainian researchers of ethnic psychology (Bakhov, 2014; Danyluyk, 2010; Konuykh, 2014) pay special attention to the issues of formation of the of the ethnic awareness and tolerance leaving unconscious aspects of this process beyond the scope of research. O. Hutsulyak (2011) analyses mythological component of the ethnic unawareness and V.M. Zayika (2014) distinguishes between three criteria of personal development. Psychological studies on the border of culturology (Gluzman et al., 2018; Alekseeva et al., 2018; Damgaci & Aydin, 2018; Carothers & Parfitt, 2017; Husnutdinov et al., 2018) reveal close connection between linguistic and psychological components of culture and mentality. According to the results of the previous research formation of the ideological and moral components of the ethnic unawareness (Melnikov et al., 2018; Jesse et al., 2016; Andrew, 2018; Boegershausen, Aquino & Reed, 2015; Ju et al., 2017) is significantly influenced by mass media whereas measures of positive discrimination are considered in the article by A. Oliven and L. Bello (2016).

In the result of the theoretical analysis (Didukh, 2014; Didukh, 2014b) such factors of the process of the ethnic individuation as multicultural environment, tolerance to uncertainty, reflection, personal maturity and type of the ethnic identity were used.

The aim of the empirical research was to reveal the mechanisms of the ethnic individuation and influence of the types of the ethnic identity and tolerance to uncertainty on the defined process. 325 Ukrainians aged 24 – 56 participated in the study among which 23% of the participants were with secondary education and the rest – with higher education. Among those under study there were 175 women and 150 men. As to the demographic characteristics all of them lived in different cities, towns and villages in proportion typical of the demographic composition of population of Ukraine.

The following methods of research were used: authorial individuation mechanisms questionnaire, in-depth interview, Budner's Scale of Tolerance – Intolerance of Ambiguity, «Ethnic identity» by H. V. Soldatova (1998). The study was conducted on the informed consent of the respondents.

Results

No evidential connection between manifestations of the process of ethnic individuation and sex, age and social status of those under study was revealed. It can be explained by the fact that the history of the process of individuation is largely connected with maturity of a person despite the fact that all the participants of the study were working socially functioning adults. The terms for becoming mature do not have any immediate correlation with the stated age of the people under study.

Among the participants there were more of those who were at the fourth stage of individuation (pragmatics was prevailing) and at the first stage (low-differentiated). Such an inequality can be explained by the influence of the external and social factors. The participants of the first group were brought up and worked in towns and villages of Ukraine. They had a little access to the information resources yet lived and grew up in the principally mono-cultural environment. Those who were at the second stage were growing up in the multi-cultural environment. The respondents at the fourth stage had higher education and were actively climbing the ranks, treated their future as promising and closely connected it with successful development of their country and people. The respondents at the fifth stage of individuation were aiming at self-realization and were publicly proactive.

Study of the correlations between the mechanisms of individuation revealed the following regularities (table 1).

Close system of the positive correlations between different mechanisms of the ethnic individuation proves that they are the manifestations of the same process yet their correlation with the other factors of individuation is not the same.

Analysis of the data received distinctly showed that the influence of the personal factors on the development of the mechanisms of the ethnic individuation is uneven. At different stages of the ethnic individuation various factors become determinant. Thus, for example, availability of the multicultural environment and life maturity is an important condition of the realization and differentiation while integration of the personality and his/her creative realization largely depends on the altruistic emotions and tolerance to uncertainty.

Table 1. Correlation between the mechanisms of the ethnic individuation

	Realization	Appropriation	Reframing	Differentiation	Internalization	Creative realization	Integration
Realization	1	-0,066	0,138**	0,084	0,129**	0,160**	0,093*
Appropriation	-0,066	1	0,443**	0,384**	0,276**	0,251**	0,235**
Reframing	0,138**	0,443**	1	0,389**	0,259**	0,321**	0,274**
Differentiation	0,084	0,384**	0,389**	1	0,224**	0,072	0,016
Internalization	0,129**	0,276**	0,259**	0,224**	1	0,153**	0,318**
Creative realization	0,160**	0,251**	0,321**	0,072	0,153**	1	0,193**
Integration	0,093*	0,235**	0,274**	0,016	0,318**	0,193**	1

*p<0,05; ** p<0,01

It is notable, that all the mechanisms of the ethnic individuation are interrelated and are the manifestations of the same process. The biggest load is on two of them namely reframing and internalization. It can be assumed that it is reframing of the history of the own people and forming of the sense of own responsibility for the contemporary events that are the triggering mechanisms of the individuation process in which mechanisms of realization (as individuation is mostly unfolding at the unconscientious level) and appropriation (that becomes part of the reframing and integration).

Application of the retrospective and perspective analysis of the intensity of the manifestations of ethnic individuation mechanisms showed that most of the respondents irrespective of their age consider the process of individuation as the one that is unfolding now and not in the past or future. Results of the analysis of the individuation process in temporal dimensions are showed in figure 1.

	1	2	3	4	5	6	7
past	2.8	3.3	3.2	2.1	3.3	2.1	2.3
now	3.5	4.48	4.88	5.2	6.5	3.4	4.9
future	3.1	4.2	4.5	4.8	6.1	3.1	4.5

Figure 1. Specifics of the realization of the individuation process in temporal dimensions (average values) (1 — Realization; 2 — Appropriation; 3 — Reframing; 4 — Differentiation; 5 — Internalization; 6 — Creative realization; 7 — Integration)

As the provided data show, the intensity of the manifestations of the individuation process is generally of medium level. Reframing and creative realization show lower indices (3,5 and 3,4 correspondingly), differentiation and internalization are upper-middle (5,2 and 6,5 correspondingly). Individuation process has the biggest impact on the dynamics of these particular mechanisms: their manifestations in the past were perceived by the participants as middle or even low while now they consider them middle and upper-middle and are sure that they will stay the same in future.

Ethnic identification giving rise to the types of ethnic identification can also influence the individuation process although such an influence can be reverse – ethnic individuation can reform non-normative types of ethnic identity. H.V. Soldatova (1998) distinguishes between six types of ethnic identity. Ethnic negativiam which is one of the forms of the altered ethnic identity shows itself in negative attitude to the own ethnic community and search for the stable social and psychological niches on the basis different from the ethnic characteristics. Ethnic indifference is a diffusion of ethnic identity which is manifested in the uncertainty concerning ethnic affiliation and out-of-dateness of ethnic self-determination. Positive ethnic identity is a combination of the positive attitude to own people with a positive attitude towards other peoples. In the poly-ethnic environment positive ethnic identity is normative and typical of the majority of population. It forms an optimal balance of tolerance in relation to other ethnic groups and allows considering it as a condition of the independent and stable existence of the ethnic group as well as a precondition for the peaceful intercultural cooperation in the poly-ethnic world.

Destructive interethnic relations are presupposed by the deformations of the ethnic self-consciousness by the type of the hyper-identity which can appear in three variants. Ethnic egoism that is represented in the relatively safe form of recognition of the events through the prism of the interests of the own people and recognition of the right of own people to solve its own problems at the expense of others. This can be a reason for the conflicts and disruption of interethnic communication. Ethnic isolationism manifests itself in the highness of the own people, necessity of «filtration» of the national culture, negative attitude towards interethnic marriages and xenophobia. Ethnic fanaticism is connected with readiness to go to any length for the sake of implementation of the own understanding of the ethnic interests, refusal to other people to exercise their rights to use resources, rights and freedoms of a person. Connection between the manifestations of individuation and types of ethnic identification is shown in table 2.

Table 2. Connection between the parameters of ethnic individuation and identification

	Positive ethnic identity	Isolationism	Ethnic negativism	Ethnic fanaticism	Ethnic indifference	Ethnic selfishness
Realization	0,101	0,039	-0,079	-0,184*	0,084	-0,230**
Appropriation	0,083	-0,157*	-0,041	0,143	-0,362**	-0,036
Reframing	0,	-0,063	-0,016	0,154*	-0,319**	-0,146*
Differentiation	0,077	-0,228**	-0,316**	0,089	0,048	-0,176*
Internalization	0,221**	0,079	-0,018	0,091	0,017	0,108
Creative realization	0,023	-0,033	0,214**	-0,156*	-0,268**	-0,055
Integration	0,078	0,093	-0,064	-0,194**	-0,302**	0,147*

*p<0,05; ** p<0,01

The data received show that the processes of individuation and identification are not similar. Mechanisms of ethnic individuation manifest themselves irrespective of the level of the positive ethnic identity; at the same time there is a proved negative correlation connection with the deviant forms of ethnic identity.

Some ethnic identity disorders can be prevented with the help of the mechanisms of ethnic individuation. Recognition favors decrease of the manifestations of ethnic negativism, ethnic fanaticism and ethnic egoism. Appropriation negatively influences on ethnic isolationism and ethnic indifference. Reframing does not have the same straightforward effect as it prevents manifestations of all the deviations; this mechanism can in some cases indicate to the increase of ethnic fanaticism. Differentiation prevents negativism, isolationism as it encourages interest in differences between own and foreign culture.

Internalization almost does not show any influence on the deviant forms of ethnic identity and favors forming of the positive ethnic identity instead. Creative realization prevents manifestations of both ethnic indifference and fanaticism. Integration can secure from deviant manifestations however is able to encourage ethnic egoism as this mechanism is focusing on the alignment of the own interests and interests of the ethnic community. Thus, we can draw a conclusion that the development of the processes of ethnic individuation can be enough successful for the prevention of the deviant forms of ethnic identity both excessive and insufficient.

We also analyzed systems of connections between the mechanisms of ethnic individuation and such a manifestation of the personality as tolerance to uncertainty (table 3). Multicultural environment was characteristic of 78% of the participants of our study and positively influences on the mechanism of assignment. It happens due to the process of comparison of the own perception and experience with world outlook of the representatives of the other ethnic groups.

Table 3. Connection of the mechanisms of ethnic individuation with multicultural and tolerance to uncertainty

Mechanisms of ethnic individuation	**Tolerance to uncertainty**			**Multicultural environment**
	Insolvability	Novelty	Difficulty	
Realization	0,175**	0,061	0,207**	-0,027
Assignment	0,262**	0,019	-0,147**	0,242**
Reframing	0,065	0,053	0,250**	0,141**
Differentiation	0,127**	0,031	0,157**	0,115*
Internalization	-0,052	-0,061	-0,073	0,066
Creative realization	0,263**	0,071	0,237**	0,040
Integration	0,013	-0,041	-0,094*	-0,085

Note: * quality at the level 0,05; ** quality at the level 0,01.

There was no connection with such a parameter of tolerance to uncertainty as fear of novelty at all and it can be explained by the fact that the process of ethnic individuation is mostly unfolding «here and now», partly comprising individual and collective past and completely excluding future.

Intolerance to insolvability encourages to solution of the difficult tasks, activation of such mechanisms as realization, appropriation, creative realization and differentiation. Intolerance to the difficulty of the world to some extent complicates the flow of some mechanisms of ethnic individuation namely appropriation and integration favoring manifestation of the other mechanisms instead. It can be explained by the fact that the process of ethnic individuation both answers some questions of a person appearing throughout life (as a consequence of the subjective complexity of the world) and gives birth to new questions.

Conclusions

In the result of the research a close connection between manifestations of ethnic individuation was found out. Mechanisms and stages of individuation are not connected with sex, age and education of a person. They are characterized by the subjective dynamics and connected with multicultural environment of the respondents. The process of individuation is influenced by the level of tolerance to uncertainty and ethnic identity.

At the next stages of the study of the process of ethnic individuation a system of the inter-influence between the process of individuation and trans-generating traumas typical of the residents of Eastern Europe will be analyzed.

Abstract
In the article, the authors reveal the essence of methodological support in partnerships with the institution of additional education. It was found that methodological support is called a holistic system of activities based on the achievements of science, best practices and analysis of teachers' difficulties, the purpose of which is to improve the skills of each teacher, generalize and develop the creative potential of the team, and achieve optimal education results. The authors examine and analyze the role of methodological support in the partnership of teachers to improve professionalism and organize additional education. In the course of the work, a survey was conducted of the employees of one of the Centers for Continuing Education in Nizhny Novgorod. A questionnaire was developed for the Center's specialists, containing several questions to evaluate their work. which showed that the organization conducts activities for the improvement of professionalism for its employees, but they are not enough, but the management is addressing this issue and is trying to develop this area, teaching competencies that require attention, the level of theoretical knowledge about the forms and methods of working with the organization of additional education, the level of practical skills in the forms and methods of work with the organization of additional education.
Keywords: methodological support, social partnership, additional education, professionalism

Introduction

Among the priorities of modern educational policy of Russia, the National Doctrine of Education of the Russian Federation is distinguished, which defines the strategic goals and objectives of the development of education until 2025, notes (Vaganova 2018);. In the light of the requirements of the new education paradigm, the main task is to increase the professionalism of specialists as an educated, creative person capable of continuous development and self-education, Fedorov (2017) points out. This implies the search for new forms and methods of work with the teaching staff. One of the most effective forms of such work is a methodical lesson. There is a contradiction between the substantial number of additional educational institutions available and the lack of attention by the management to organizing methodological support with the team, which underlines the problem of the study. The aim of the work is to examine and analyze the role of methodological support in the partnership of teachers to improve professionalism and the organization of additional education.

Literature Review

Institutions of additional education, first of all, organize the social environment in which students find themselves. It is up to any such institution to inform students: for example, to conduct lectures, conversations, distribution of special literature, or video and television films. These actions help develop responsibility in the learner. But for the implementation of activities requires special training of teachers. The standard contains a description of the necessary knowledge for the implementation of skills in the activities of the teacher of additional education. However, knowledge alone is not enough for the successful implementation of the tasks of additional education; the teacher needs special personal qualities that ensure his professional competence and success.
Carrying out activities in the organization of additional education, the specialist must have the energy to charge the audience with his positive mood, attitude to the business, the students speak (Vaganova 2017a; Smirnova 2017a; Perova 2017; Bulaeva 2018). And one more important, in our opinion, component of a teacher – professional is the ability and readiness to make a first impression on the audience (in one's own

way, in behavior, knowledge, attitude to professional activity), which in many cases determines the further dynamics of the interaction process.

Methodical support is called a holistic system of activities based on the achievements of science, best practices and analysis of teachers' difficulties, the purpose of which is to improve the skills of each teacher, generalize and develop the creative potential of the team, achieve optimal educational results, notes (Vaganova 2017b; Smirnova 2017b; Ilyashenko 2018c) .

The urgency of the problem of studying the mechanism of methodological support of pedagogical activity in the context of additional education is to find the existing shortcomings and develop proposals for improving this activity. Methodological support for teachers in institutions of additional education is conducted by the methodological service through a specially organized, systematic interaction between the methodologist and the teacher, aimed at assisting the teacher in a situation of professional improvement, taking into account his existing level of professional competence in his work (Tsyplakova 2016; Markova 2018; Garina 2017, 2018). Methodical work is an integral part of the activities of teachers of additional education notes Yashin (2017). Through the methodological support of teachers, tasks are solved to ensure the effectiveness of the activities of circles, training groups, other types of extracurricular activities, educational activities through the active use of information, computer and health-saving technologies, systematic methodical and handouts are being systematized, and teachers are focused on drawing up creative reports and increasing the level of self-education each member of the teaching staff, says (Smirnova 2018a; Ilyashenko 2018b; Potashnik 2018) . An important task is to improve the innovative orientation of the activities of teachers, which is manifested in the systematic study, synthesis and dissemination of effective teaching experience. It is also important to motivate educators to publish excellence in print and other types of media. The organization of methodological classes plays a special role in the system of improving teachers' professionalism (Smirnova 2018b; Ilyashenko 2018a; Lubov 2018) Methodical classes with the pedagogical team of specialists of the organization of additional education of children are designed to ensure that the methodical organization of additional education meets the requirements of the Concept of additional education and the standard of the teacher of additional education: variability, lack of formalization and program updates, methodical diversity Ia (methods, forms, techniques and means) of their expediency, developing, problem and applied orientation.

Methodical studies are organized to solve the following tasks: teaching new approaches to building additional education in a specific area (new forms, methods, techniques, teaching aids) says (Kutepov 2017; Kuznetsov 2018; Pavlov 2016) to finding various sources of information required for an additional education teacher to solve professional problems and self-education; improving methodological and logistical support; establishing links with the methodological service of the municipality, other institutions of additional education of the city, town, district, region; mastering effective methods and techniques for working with students who are gifted in their chosen field of activity, mastering the skills to create the special conditions necessary for further education of people with disabilities are noted (Sadker 2015; Safford 2014; Schmidt 2016; Schweers 2015). The organization of methodological classes on psychological and pedagogical support and improvement of professionalism of the specialist of additional education should be a holistic system of cooperation accompanying and accompanied, which occurs in the process of pedagogical interaction, has a humanistic nature, is complex, uses personality-oriented forms that ensure professional growth of a specialist and productivity his activities speak (Hernandez 2014, Hunt 2015).

Methodology

In order to assess the work with the teaching staff to improve their professionalism, a survey was conducted with experts. In total, 12 specialists from the Center took part in the study. They were offered a questionnaire. After filling out the questionnaire, participants were asked to explain their answers in an interview.

The base of the research: the Trivium private center for additional education for children. The main contingent of children is from 1 to 7 years. On the basis of the center, educational activities for children with speech lag, robotics, chess, dance classes are held; Works on painting and sculpting; consultations are conducted by a psychologist and speech therapist, a mini-kindergarten, a city camp, creative and artistic workshops, and children's parties. In order to develop recommendations on the organization of methodological support with the teaching staff of the Center, observation and study of available documentation was conducted. The purpose of the study is to evaluate the effectiveness of conducting methodological support in partnership with the Trivium center for additional education of children and with their teaching staff as a condition for improving the professionalism of specialists. One of the most important methodical events of the Center "Trivium" is the meeting of the members of the methodological association. It is held 4–5 times a year in accordance with the plan of methodical work on the days established for this with the purpose of collective discussion of the issues of organization and implementation of the educational process, methods of pedagogical activities of specialists, students' successes.

Analysis And Discussion

In the Trivium Center under study, for the period from September 2017 to April 2018, only 2 methodical classes were conducted. In these classes, the Center's specialists master the patterns of actions in a developing educational environment, comprehend the relationship between an environment saturated with intellectual resources and the effectiveness of training and education. The main goal of the first lesson was to discuss and train specialists in the best ways to interact, as well as ensure the continuity of the Center and pre-school and primary education, and the successful adaptation of children to circle and club work. The second lesson was devoted to the organization of work to preserve the physical and psychological health of children of preschool age. A pediatrician, a psychologist, a teacher of a pre-school education institution participated in this event. In the process of implementing these activities, in general, the task of improving the professionalism of the organization's staff was carried out: their professional experience was expanded, and interaction with specialists of different profiles was carried out.

For specialists of the Center a questionnaire was developed containing several questions for the purpose of evaluating their work. The first was a question about how research participants evaluated the level of theoretical knowledge about the forms and methods of work about the organization of additional education.

Table 1

Questionnaire for center specialists

Question	Answer Options
How would you rate your level of theoretical knowledge about the forms and methods of working with the organization of additional education?	A) highly B) medium C) low
How do you assess your level of practical skills in the forms and methods of work with the organization of additional education?	A) highly B) medium C) low
How do you assess the desire of colleagues and management to interact with you?	A) highly B) medium C) low
Which side of your professional competence, in your opinion, needs improvement from you?	A) pedagogical competence B) methodological competence C) instrumental competence D) integral competence D) communicative

	competence
At what level do you consider the work of the management of the Center to improve your professionalism?	A) highly B) medium C) low

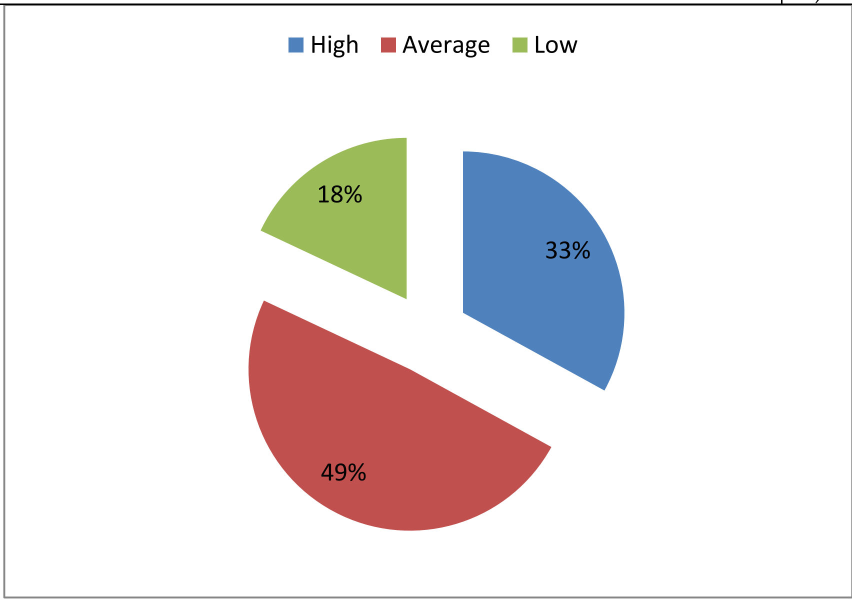

Figure 1 The results obtained on the basis of the analysis of the first question about the level of theoretical knowledge

The results showed that the majority of participants (49%) evaluated their theoretical knowledge at an average level: in an interview, the participants explained that they generally possess the knowledge they need to conduct group and club work on specialization. However, theoretical knowledge about the effectiveness of the organization of classes in the conditions of the Center is not enough for them. In the conversation, the participants also explained that this level depends on the personal aspiration of specialists to obtain theoretical knowledge, which, at times, they do not have enough time.

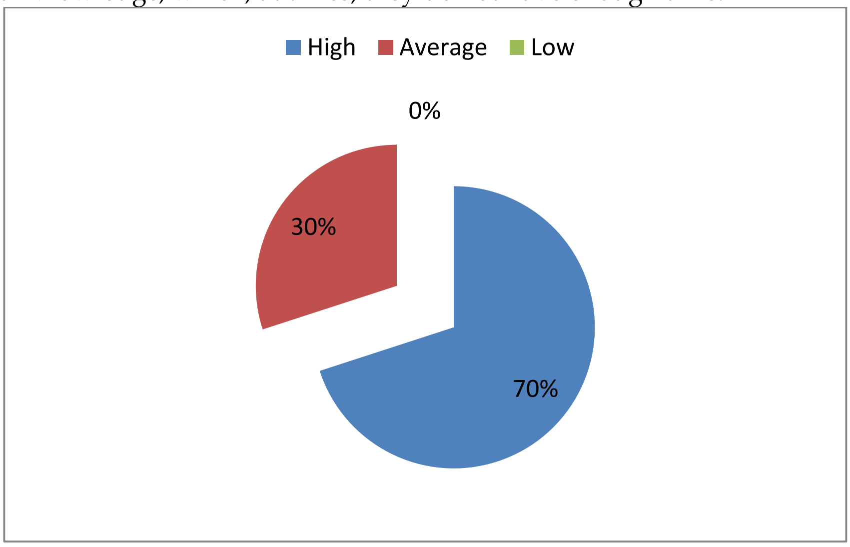

Figure 2 The results obtained on the basis of the analysis of the second question on practical skills

None of the participants noted a low level. The majority (70%) of specialists are confident in their practical knowledge. 30% of the study participants considered that they needed to learn from the experience of their colleagues, to take part in various events organized by specialists in other similar centers, which is not being carried out at the moment. These participants do not always feel confident in the competent work with the parents of students. In most cases, participants need to master innovative forms of cooperation with parents, and they are also concerned about the psychological side (resolving conflicts in working with parents with a low general and pedagogical culture, etc.). In the conversation, the participants explained that it was difficult for them to build pedagogical communication in tandem with other employees of the Center due to the lack of necessary knowledge**.**

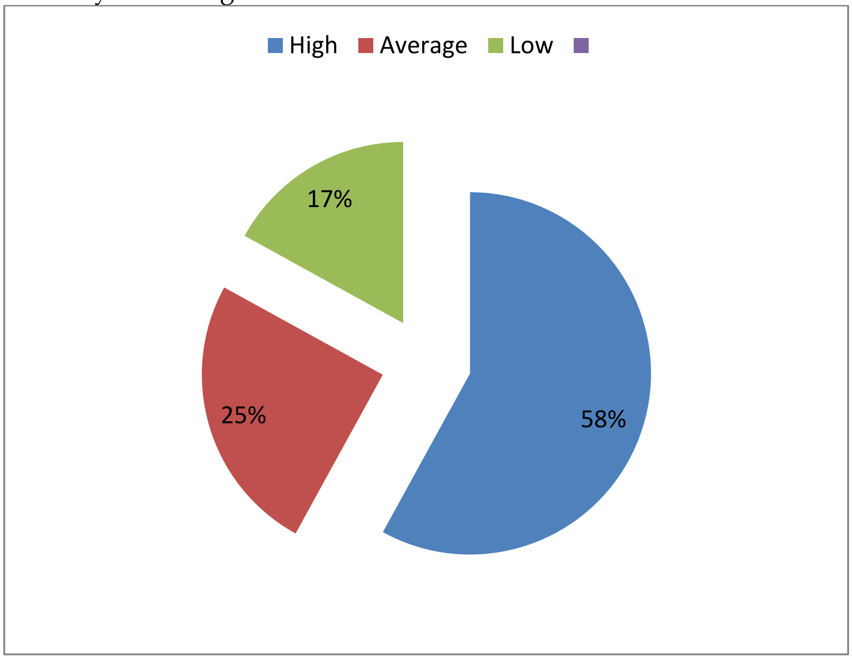

Figure 3 The results obtained on the basis of the analysis of the third question on the assessment of the willingness of colleagues and the management of the Center to interact with the study participants

Most participants appreciated the interaction with colleagues and management. In the conversation, they explained that, in general, in the event of problems arising in their work, they may turn to their colleagues and management. Participants noted that colleagues and leaders approve of them, try to help them in every way possible in organizing events, give advice, tell in detail about their observations of children, etc. Nevertheless, 17% of the participants indicated that they did not find the support of the leadership in solving urgent issues. In many ways, they relate to the material aspect of the activities of specialists.

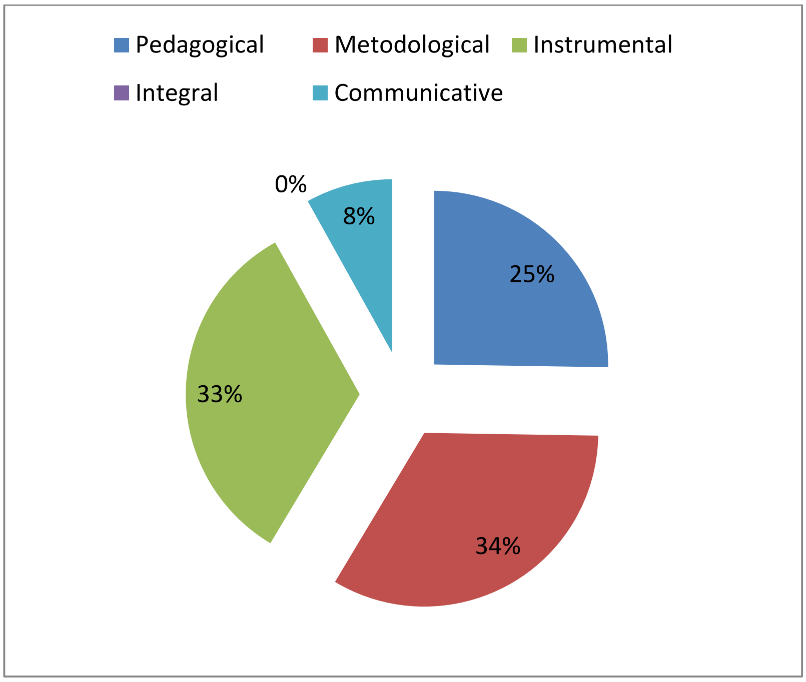

Figure 4 The results obtained on the basis of the analysis of the fourth question "Which side of your professional competence, in your opinion, needs improvement from you?"

Most teachers believe that they have the least instrumental and methodological competence. This means that, in general, experts still have little understanding of the scientific and theoretical foundations of the profession, they do not completely see the correctional-educational process and, in many ways, act intuitively. Experts noted that they lack the necessary methodological and psychological knowledge. Also, specialists need to improve knowledge of differentiated pedagogical technologies, ideas about methods and means of correcting and preventing existing disorders in children, as well as methods and forms of cooperation with parents. Most of the participants, in their opinion, have developed integral competence - the application of theoretical knowledge in practice, the desire to develop their personality as a professional. Teachers also noted that they lack a personal culture of communication, the development of empathy, the motivation to gain practical experience.

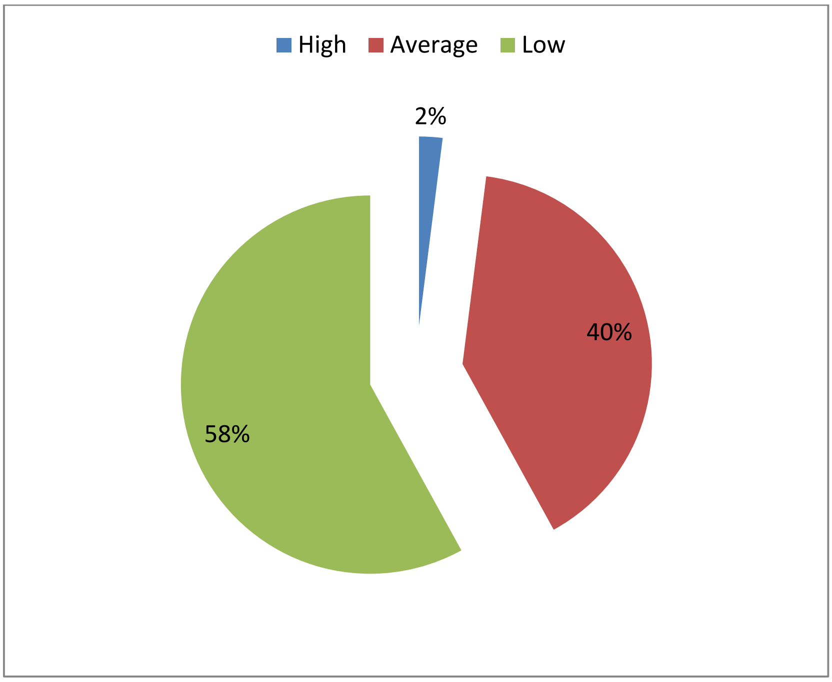

Figure 5 The results obtained on the basis of the analysis of the fifth question "At what level do you consider the work of the management of the Center to improve your professionalism?"

Only 2% of respondents indicated a high level of leadership assistance. In general, as shown by the answers of specialists, the organization still carries out activities for them to improve the professionalism of workers, but they are not enough, but management is addressing this issue and trying to develop this area. All participants admitted that they would be happy to participate in events within the walls of the Center itself.

Conclusion

Observing and studying the documentation of the Center showed that the main link in the management structure of the organization's teachers is the methodical association of teachers. It is this department that develops and implements specific projects and events, consistently implements plans and recommendations approved by the administration. The head of the methodological association builds its work, analyzing the activities of the methodical association in the past year, comprehending the tasks set for the new academic year, getting acquainted with the plan of the upcoming district and school-wide events, annual plans of the school's educational and educational work. The tasks of the methodical association determine the directions of its work: holding meetings of the methodical association; meeting the requirements of regulatory documents, decisions and recommendations of a methodical association; acquaintance with advanced experience in the field of additional education and its introduction into the activities of specialists; preparation and holding of conferences, seminars, round tables; intellectual marathons, olympiads; activities for clubs and clubs; attendance of classes according to available directions. Thus, the role of methodological support in the partnership of teachers to improve professionalism and the organization of additional education was reviewed and analyzed. The survey and interviews showed that the issue of improving the professionalism of the staff of the organization of additional education in the Center in question requires additional attention. It may be noted the importance and the need to improve the mechanism of methodological support of pedagogical activity in the conditions of the studied center of additional education.

Abstract

The active changes taking place in modern society are the reason for changing priorities not only in the sphere of economics and politics, but also in the field of education. Therefore, educational institutions are seeking new methods that promote the development of the organization in the best possible way. One of the promising areas in this regard is interaction with social partners. Institutions of additional education of students are one of the main social institutions that provide the educational process and the development of individual abilities of students. In their work, they try to attract new tools to provide a higher level of services. In the article, the authors reveal the importance of social partnership for institutions of additional education. The essence of social partnership for educational institutions as a whole was revealed and its necessity was revealed by interviewing participants in a particular institution of additional education. A large percentage of respondents consider courses from center specialists useful educational information that is easily used in ordinary life, which has a positive effect. In addition, the great popularity of such a new direction as body ballet was defined, which includes quite a lot of physical exercises, without requiring large power loads and sudden movements.

Keywords: social partnership, additional education institution, students, parents.

Introduction

Measures to improve the education system reflect the state program of the Russian Federation "Development of Education" for 2018-2025, as well as the concept of the development of additional education for children until 2020. At the same time, the leadership of the institutions of additional education is faced with the task not only to provide high-quality training for existing students, but also to attract new students.

In addition, the socio-economic conditions in which educational institutions operate force leaders to look for new forms of management, new, improved management mechanisms, additional resources capable of ensuring the sustainable functioning and further progressive development of the educational institution. One of the promising areas in this regard is interaction with social partners.

Institutions of additional education of students are one of the main social institutions that provide the educational process and the development of individual abilities of students. Their presence in the country has an important role. In modern education, an individualized approach is appreciated, and since general education institutions do not have a choice of type of activity, additional education institutions provide it, besides students can choose the level of complexity and pace of development of the educational program of additional education in their chosen field. These institutions solve the task of developing the skills and abilities of students, which will ensure self-development in later life.

Additional education at the state level is taken as an important resource for ensuring the human right to free personal development and professional self-determination. Services in the system of additional education are the results (products) of the activities of the collective of the institution of additional education in various areas of social and cultural activities: group activities, club activities, development of creative innovative projects, organization and holding of competitions of conferences, forums, exhibitions and other events of various sizes are designed to perform such functions as communicative, outreach, cultural, recreational and health vayuschaya ideological defining the mission of additional education in modern Russian society.

The communicative function is that a special communication space is created on the territory of the institution of supplementary education, connecting people with common interests and goals (Prokhorova, 2018). The informational and educational function is manifested in the fact that the institution of additional

education expands the horizons of students and their parents in various areas of artistic and technical creativity, as well as topical issues of everyday culture and life organization through the promotion of healthy lifestyles and safe behavior (Myalkina, 2018). The cultural function, its essence is that participation in the work of creative teams, circles and club associations allows each participant to make his own contribution to the creation of new cultural events, new creative products and services that expand the cultural diversity of the surrounding society. Recreational and recreational - active leisure time ensures that the psychological and physical overloads associated with compulsory study load (school, college, university) will be to some extent compensated by other types of creative activity (artistic, dance, music, technical) .
An educational institution, like any other social organization, actively interacts with the external environment, which has a multilateral influence on it (Campbell 2014), (Banks 2013). The establishment of additional education, given the lack of funding, in turn, can influence the situation in its immediate environment by promoting services and building partnerships (Bulaeva 2018). Promotion of services of the municipal institution of additional education should be based on mutually beneficial interaction with social partners, which are government management structures of different levels, educational organizations of all levels of education; cultural institutions (theaters, museums, etc.) and sports; commercial organizations.

Literature Review

Modern social partnership

"Social partnership" is a relatively new concept. It appeared in Russia in connection with the change of forms of ownership (Garina 2017). Today, the term has received an extended interpretation: it means a certain type of social interaction, characterized by a special way of regulating social relations between different social groups based on equal cooperation. In this case, different authors can find some differences in the definitions (Hamitowa 2017). But at the same time, all researchers see two aspects in social partnership: organizational (in this case, social partnership is seen as association, community, union, joint activity) and personal (supposes relationships based on trust, mutual understanding, consent and, moreover, participation in a common cause and even empathy) (Chaikina 2018). And this is no accident, because not only enterprises and institutions can act as partners of an educational organization, but also individuals, in particular parents of students. Modern educational organizations are independently developing mechanisms for finding and establishing partnerships (Ilyashenko 2018a). The researchers propose to distinguish the relationship: in form (contractual, organizational); by level (macro level, meso level, micro level); by type of interaction (charity, sponsorship, cooperation, investment) (Garina 2018). When characterizing the very process of partnership development, the stages are marked - preparatory, organizational, functional (Tosolt 2010). At the first - preparatory stage, common goals, values, capabilities and resources of the parties are determined (Carl 2015). The second stage defines the legal framework of the partnership. Legal registration of social partnership relations is carried out by concluding contracts (Ilyashenko 2018b). Next comes the functional phase in which the construction of partnerships takes place - partnership projects are being developed, joint activities are planned, the functions of both parties are further elaborated and directly implemented (Tiedt 2012). All this should be done while observing the principles of voluntariness, mutual interest, responsibility of the parties, as well as mutual trust (Vaganova, 2017b). Only in this way can mutually beneficial relationships be established that serve as the basis for long-term joint activities (Ilyashenko, 2018c). The school forms the "open space" of its activities, involving everyone who is interested in its development and promotion (Nikolai, 2017b). By initiating, actualizing and coordinating social partnership, the school itself rises to a new level of its development (Smirnova, 2017a).

Partnerships in the promotion of additional educational services

Social partnership plays a big role in promoting the services of an additional education institution (Ilyashenko 2018d). Promotion is a set of activities aimed at increasing the demand for the product being promoted and, as a result, aimed at increasing sales efficiency through the communicative impact on personnel, partners and consumers (Skatova 2018). In the field of education, three methods of product promotion (out of four possible) are used: advertising, direct marketing, and direct public relations (social partnership) (Calkins 2014). Public Relations (PR) - measures to build relationships between the organization and the audience to create a reputation that is beneficial for the organization (Vaganova 2018). PR is a managerial function of establishing and maintaining mutually beneficial relations between an organization and the public, the success or failure of this organization (Nikolai 2017a) depends on the mood and opinions. PR activities in the field of education are primarily aimed at strengthening and building trust between the target audience and the educational institution (Ivanova 2017), (Vaganova 2017a). First of all, PR activities should be aimed at ensuring that educational institutions have a positive reputation and long-term relationships with consumers (Kochetova 2017). The target audience of PR activities in the field of additional education, and at the same time social partners are parents of schoolchildren, students themselves, teaching staff, employees of educational institutions, government officials, partners and sponsors (Markova 2018). As a rule, the following event-events are held to promote services - presentations, conferences, round tables, open days, courtyard holidays, contests and exhibitions, sports tournaments and battle shows, master classes, and open holidays for parents. (Pavlov 2016). As noted, MA Belyaev, V.A. Samkova, holding numerous events (open doors, exhibitions, forums (Berry 2012), conferences, lectures of famous personalities, parents' meetings) the task is to maintain the image of an educational institution, to create its brand, to promote services (Perova 2017). The difference between advertising and direct marketing from public relations is that the first two points are aimed at an additional cash flow, and the third point is focused primarily on creating the image of the organization (Smirnova 2018). Partnerships are built in different ways (Smirnova 2017b).

Methodology

To determine the need for partnerships in the development of an institution of additional education, we conducted a survey among parents whose children study at the Sun institution of additional education after the introduction of classes provided by the specialists of the Rost health center. 32 people took part in the survey. As a result of the analysis of the obtained data, we found that parents are positive about innovations, so the cooperation of organizations can be considered successful. Specialists of the center provide services at the proper level, so that students like to attend classes. Such interaction takes the Sun activity to a new level.

Analysis And Discussion

In order to determine the significance of partnerships in the activities of the institution of additional education, we conducted a survey of parents of pupils of the institution of additional education "Sun", which builds partnerships with the health center "Rost". Thanks to the cooperation with the employees of the center in the institution of additional education, additional directions for the development of students have emerged, such as stretching, body ballet, recreational gymnastics, educational conversations with parents about the methods of maintaining the child's health in modern conditions. We needed to find out the attitude of parents to this interaction.

Among the parents, a survey was conducted, presented in Table 1. 32 people took part in it. Of these, 22 people aged from 35 to 45 years and 10 people from 53 to 55 years.

Table 1

Survey of parents to establish the need for cooperation organizations

Do you like the introduction of the possibility of additional classes of these types in our institution?	Well no
How do you feel about the educational course for parents from the specialists of the "Rost" institution?	I think it is useful / I think that I am knowledgeable (on) about preserving the health of my child and do not need additional information.
Would you like to attend courses for parents in the future?	Well no
Which of the following activities does your child attend?	stretching body ballet

	recreational gymnastics
Do you think your child is happy to attend classes?	Well no
Will your child continue to attend health classes?	Well no
Would you recommend visiting the institution of additional education "Sun" to your friends?	Well no

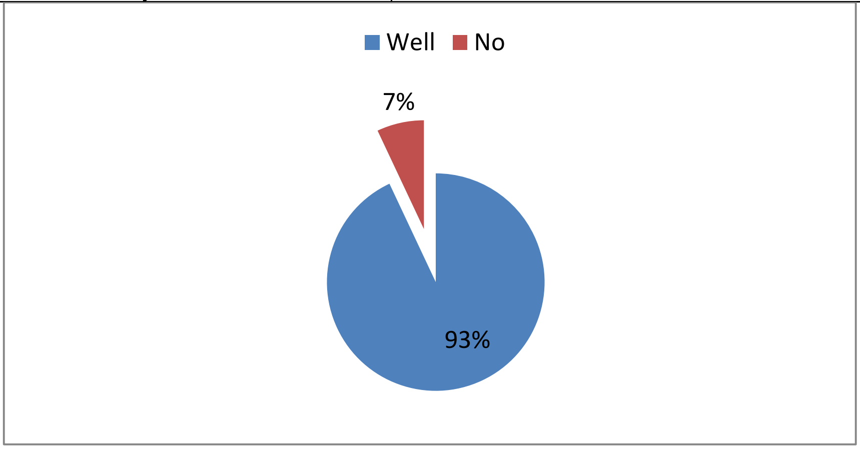

Figure 1 The results of parents' answers to the question "Do you like the introduction of the possibility of additional classes of these types in our institution?"

As shown in the figure, almost all parents are satisfied with the introduction of extra classes from the specialists of the Rost center. In addition, an additional conversation showed that parents enjoy the participation of certified specialists in the field of health preservation in the education of their children.

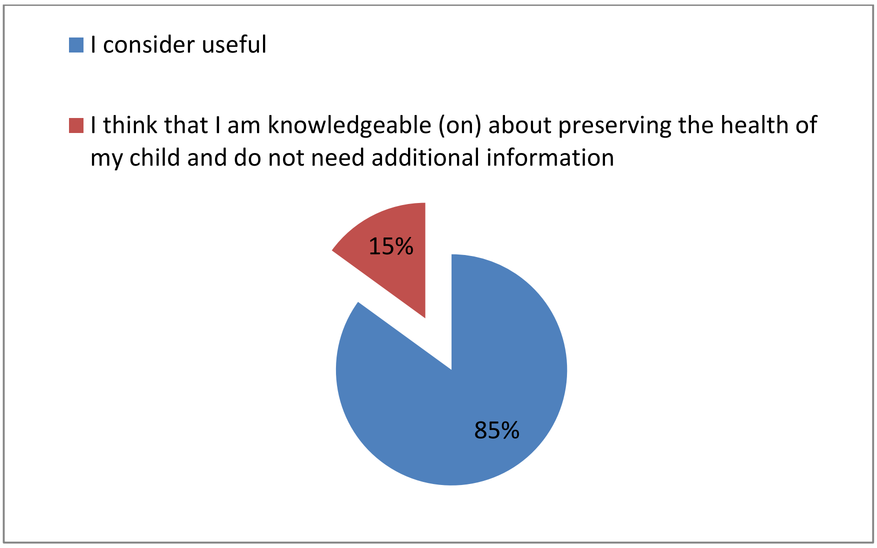

Figure 2 The results obtained on the basis of the analysis of answers to the question "What is your attitude to the educational course for parents from the specialists of the Rost institution?"

85% of parents consider courses from specialists of the center as useful educational information that is easily used in ordinary life, which has a positive effect. However, some parents believe that they themselves are quite knowledgeable in this area. Note that most of the respondents from this number are the older generation, but this speaks more about their conservatism than their reluctance to participate in such events.

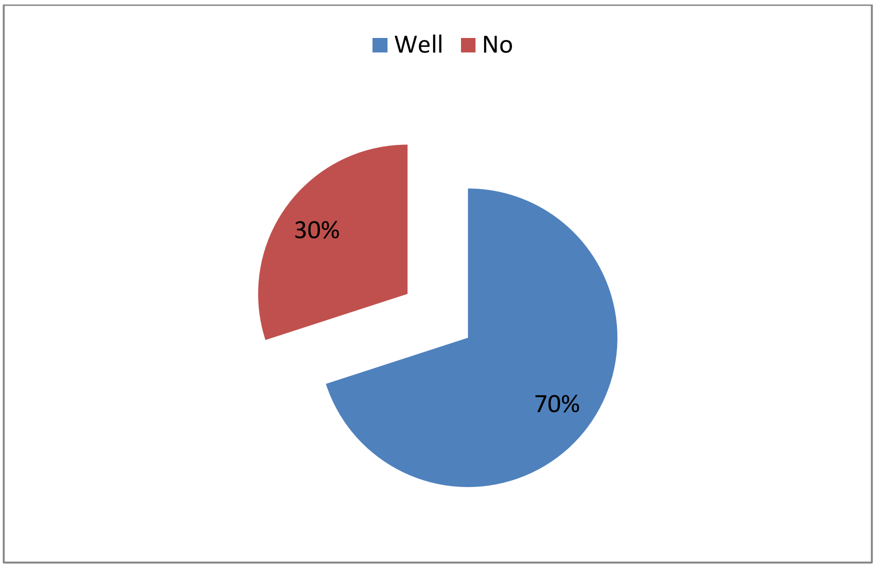

Figure 3 The results obtained on the basis of an analysis of the answer to the question "Would you like to attend further courses for parents?"

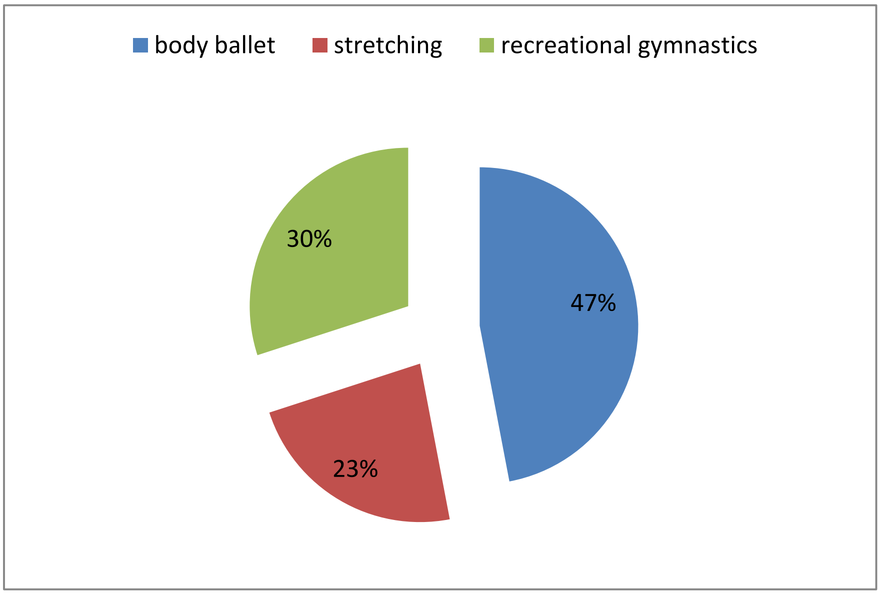

Figure 4 The results obtained on the basis of an analysis of the answer to the question "Which of the specified classes does your child attend?"

The most popular is the new direction of body ballet, which includes a lot of physical exercise without requiring large power loads and sudden movements. Recreational gymnastics is in second place as the most understandable and long-existing type of exercise. In third place (23%) is stretching.

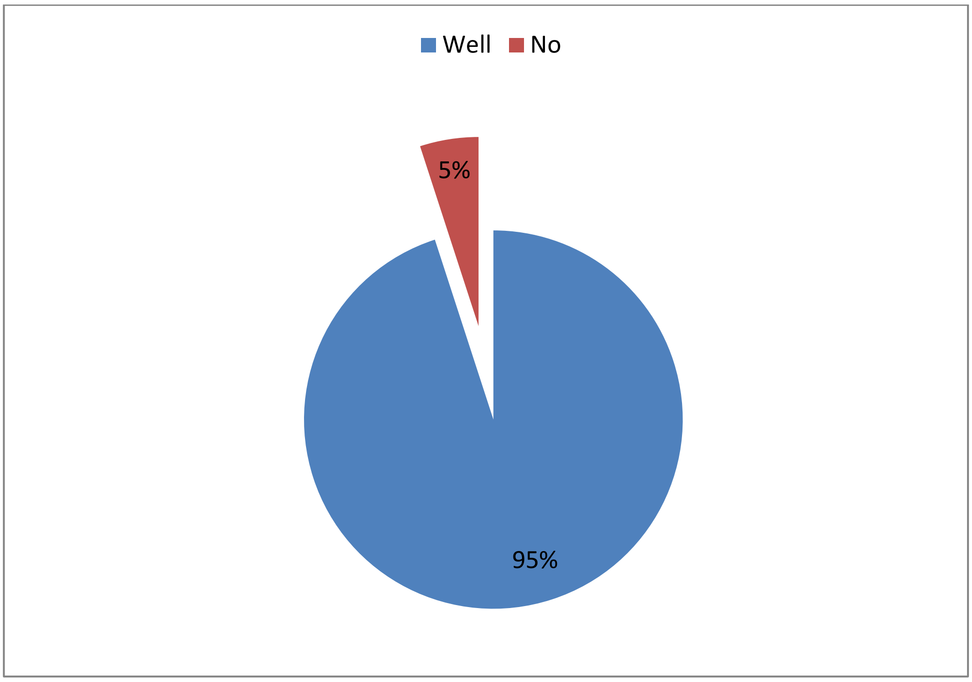

Figure 5 The results of answering the question "Do you think your child is happy with the attendance of classes?"

Almost all students are satisfied with the attendance of their chosen classes, that is, their demand is obvious.

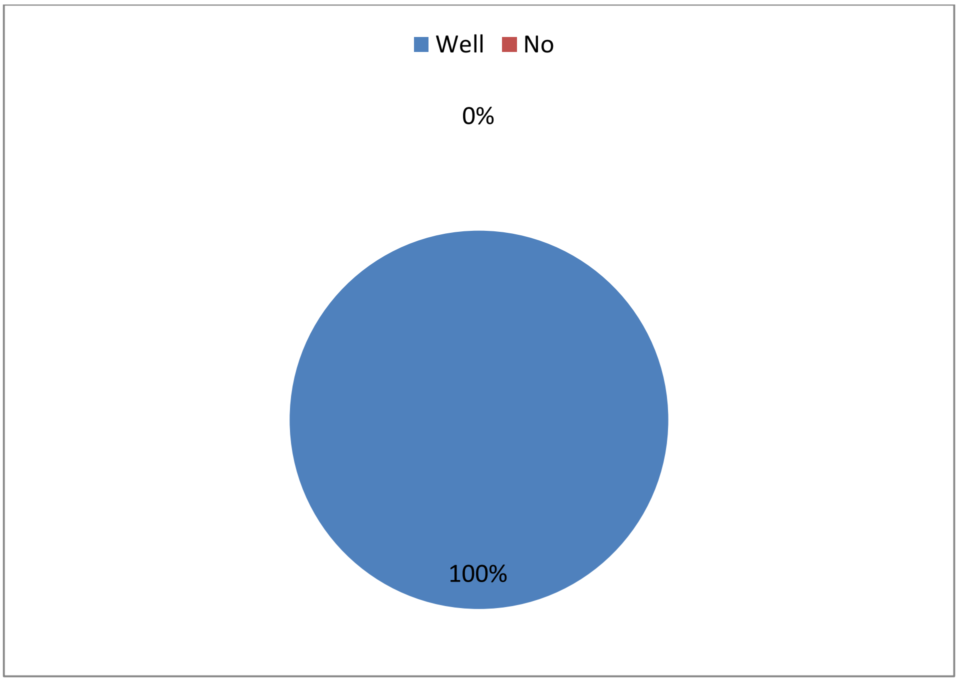

Figure 6 Results of the answer to the question "Will your child continue to attend classes on recovery?"

All parents unanimously advocated further visits to new classes.

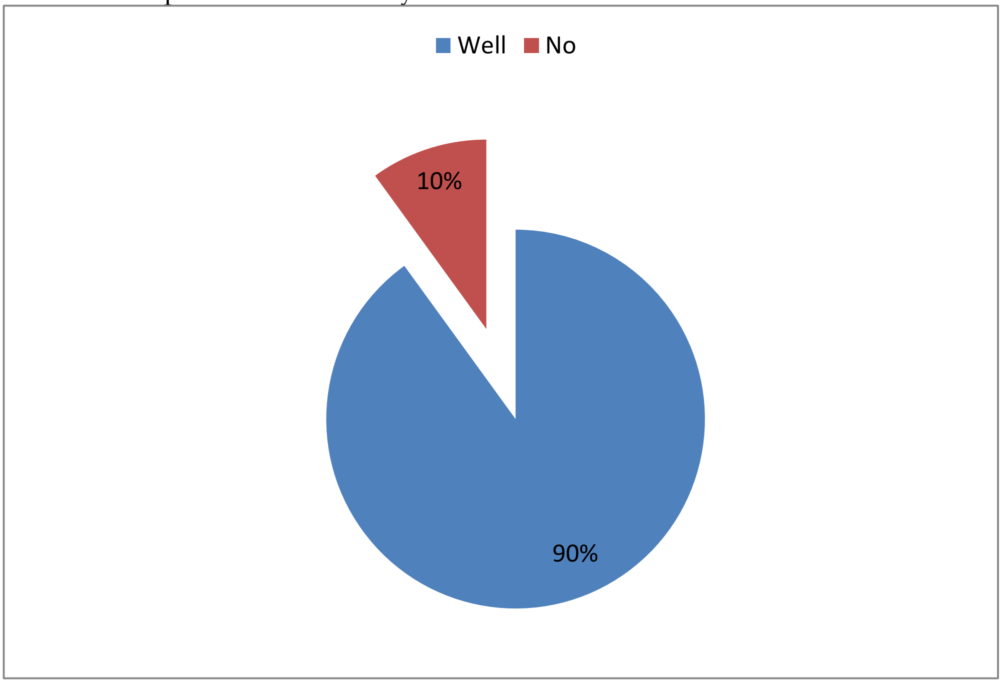

Figure 7 The results of the answer to the question "Would you recommend visiting the institution of additional education" The Sun "to your friends?"

Most parents actively disseminate positive reviews about the "Sun".

Conclusion

Thus, social partnership is an important element in the promotion of additional educational services. For the modern Russian situation, when the possibilities of advertising and direct marketing are limited, social partnership is becoming a decisive condition for promoting the services of an additional education institution. By social partnership is meant such a form of interaction between two or more parties, in which long-term mutually beneficial relationships are built.

Assessing the role of partners for the development of the institution itself, it can be said that social partnership helps to attract resources for the development of the institution, serves as a form of "sharing of responsibility" for training and educating students, and therefore increases the impact on them, and, what is especially important, can serve factor in the formation of a positive image of the institution of additional education.

The study showed that parents perceive the partnership of the Sun additional education institution with the Rost health center positively. Additional services that appeared in the institution seemed to them useful and expanding opportunities for students and as a consequence for the institution of additional education. In this case, the benefits of social partnership are obvious.

Management of Consolidation Potential of Patriotism in the Regional Space of The South of Russia

Anna V. Vereshchagina, Yuriy G. Volkov, Azamat K. Lyuev, Andrey V. Rachipa and Vladimir V. Uzunov

Abstract

Patriotism has a powerful resource potential, which allows consolidating society around socially significant goals and objectives, in connection with which the management of the consolidation potential of patriotism becomes a significant factor in social development. The article actualizes and considers the problem of managing the consolidation potential of patriotism in the South of Russia from the standpoint of critical understanding of the Russian socio-political reality the regional space of which is represented by a complex interweaving of ethno-cultural, confessional, ethno-political and economic processes, and is characterized by tension and contradiction of interethnic relations. The obvious consolidative and solidarity potential of patriotism in the case of its effective use in the regional space of the South of Russia can become the basis for the harmonization of inter-ethnic relations and the solution of acute social problems. However, it depends on the choice of paradigms of patriotism (statist, civil, etc.) in the management strategies of regional power structures and organizations of regional society. In the course of this study, the author substantiates the statist vector of patriotism of the population of the South of Russia, which corresponds to the all-Russian logic of Patriotic education of citizens of the country against the background of curtailment of the democratic course of the Russian state's development, in which patriotism becomes a powerful resource of political influence and manipulation of mass consciousness, and its consolidation potential is used to strengthen the ruling elite and its political course.

Keywords: patriotism, social consolidation, regional space, potential management, statist patriotism, blind patriotism, constructive patriotism,civic patriotism.

Introduction

In the critical stages of social development, in the period of fundamental reforms and change of the social order, there is a rethinking of values, moral, political, ideological orientations, accompanied, as a rule, by a crisis of the system of society's spiritual reproduction and the growth of threats to the national security of the state. It is Patriotic values, as the researchers note, that help people not to get lost and find in them the *foundation* of civil consolidation (Orekhovskaya & Orekhovsky, 2016), to remain as a socio-cultural whole, able to overcome the difficulties and obstacles that necessarily arise in a period of profound social change (Volkov, 2008). However, very often, on the wave of social changes, their misinterpretation with skillful agitation by interested forces, there is a distortion of patriotism, the very essence of this phenomenon, which in such a meaningless form, devoid of its deep value bases, ceases to be a mechanism of social consolidation.

In the modern world, patriotism as a managerial resource and ideological weapon is actively used by various political forces in various countries, which has created a discursive space in which patriotism is studied in the context of its relationship with nationalism (Anderson, 1983; Gellner, 1983; Hobsbawm, 1992; Miller, 1995; Beck & Beck-Gernsheim, 2009), distinguishing between true and false aspects and meanings (Dustin, 2005).

In Russia, patriotism in its historical trajectory of formation appears as a feeling of love for the Motherland, the place of birth and residence, i.e. it is irrational or included in the structure of the mental matrix of social behavior in Russian society as a basic element (Lubsky, Kolesnykova & Lubsky, 2016). In its mental security patriotism after a long search for a national idea that can unite the Russians, proclaimed such an idea (Lubsky, Kolesnykova & Lubsky, 2016; Volkov, & Lubskiy, 2016), which becomes a powerful factor in the mobilization of the Russian population, especially against the backdrop of sanctions policy of the West.

The problems of consolidation of Russian society is inherently stacked in problems of regional consolidation, without which, principally it is impossible to talk about consolidation in Russia, the regional space which is multi-ethnic and needy in the platform for intercultural dialogue and the formation of

Russian identity as the basis for inter-ethnic consolidation. In this respect, the South of Russia attracts considerable attention as one of the most multi-ethnic regions of the Russian Federation, in the national republics of which ethno-national identity plays an important role, based on ethno-cultural traditions and historical memory of ethnic communities. In this regard, of particular scientific interest is the question of how Patriotic values and Patriotic practices are formed in the regional space of the South of Russia, and what management technologies are used in this case.

Methodological Framework

The Russian scientific literature has a long tradition of studying patriotism, which has accumulated extensive material in the study of this phenomenon from the standpoint of its consolidative potential and various disciplinary practices (philosophical, historical, political study, psychological, sociological), the generalization of which is presented in a number of studies (Rozhkova & Vasilyeva, 2014; Volkov, Vereshchagina & Lubsky, 2018; Volkov et al., 2017), from which it follows that patriotism in Russia is naturally associated with the history of Russian society in its individual ethno-regional formations, having its own specifics and problem areas.

With all the available scientific literature, the social potential of patriotism in local communities in the South of Russia as an object of management has not yet become the subject of special sociological research, which determines the scientific novelty and significance of this study, in which the interpretation of theoretical and empirical information is carried out in the logic of the cognitive scheme, appealing to the analysis of Patriotic practices formed in the regional space of the South of the country.

Management of the consolidation potential of patriotism involves the formation of a certain type of Patriotic practices in society, which defines as a significant methodological basis for their study the theory of social practices, which, thanks to the works of E. Giddens (2005), appears in the form of the theory of institutional practices as typical, deeply rooted in space and time, collectively meaningful and acting as the basis for the reproduction of the social order. It is also important to develop the theory of social practices of P. Bourdieu (1994), which substantiates the fact that the components of social practices of individuals' actions can be both expedient, conscious and meaningful, and has unconscious, illogical, devoid of meaningless character, as it may seem from the outside. At the heart of its concept is the notion of habitus, which, in fact, explains the nature of practices and their historical conditionality.

Management of the consolidation potential of patriotism involves the use of the potential of regional sociology, in which the subjects of regional governance (government, business structures, non-profit organizations) operate in a geographically differentiated social space as a space of interaction between various social institutions and actors (Markin, 2014). Moreover, on this basis, management practices in the field of patriotism in the regional space of the South of Russia should be considered from the standpoint of formal (state, government, regulatory) and informal (public) practices.

Results

The management of the consolidation potential of patriotism in the South of Russia, characterized by a complex ethno-social structure, is extremely important and interesting from the point of view of the concentration of negative consolidation factors in a number of local regional communities. The study of this problem from the standpoint of its formal and informal aspects has led to a number of results.

Formal mechanisms for managing the potential of social consolidation of patriotism in the South of Russia are regulated primarily by the state program of Patriotic education of citizens of the Russian Federation, as well as regional programs of Patriotic education of citizens, developed on its basis (*on Patriotic and spiritual and moral education in the Republic of Crimea, on Patriotic education of citizens in the Stavropol region, on Patriotic education of citizens of the Rostov region,* etc.).

The implementation of Patriotic education within the formal boundaries of this Program, quite fitting into the mental program of normative behavior in Russian society, in which patriotism is based on the statist ethic of service and readiness to protect the Fatherland from external enemies, is largely focused on the formation of Patriotic practices associated with the formation of negative identity. It is based on the image of the enemy and the need to fight it, and today almost a quarter of Russians agree that Russia is surrounded by enemies from all sides, and such tactics works to form heroic patriotism which is a well-known and rooted in the mental practices of Russians, including in the South of Russia, and which is the basis of the sovereign patriotism. The main resources for the formation of this type of patriotism is the Great Patriotic War, the historical memory of which and its reproduction in the regional space of the South of Russia resulted in the large-scale development of the military-Patriotic movement, in which representatives of all age social groups take part, but this movement is focused primarily on the youth of the region. Its mass involvement in such Patriotic practices is expressed in the spread of military-Patriotic clubs and organizations, movements and events, various actions *(Candle of memory, Immortal regiment, Roads of glory – our history, Grandfathers' victory – the road of light, Watch of memory*, etc.) dedicated to the historical memory and cultivation of the heroic past of Russia and the region. At the present stage, the most common among the Patriotic practices in the South of Russia are the practices of military mobilization character *(Vertical, Paratrooper, midshipmen, Scout*, etc.), actively supported by regional structures and authorities and aimed at supporting the ruling power in the country and the ongoing political course.

In General, on the territory of the entire South of Russia there are typical military-Patriotic practices, mostly associated with the second world war, with the Victory over fascism, the formation of military training of young people, others, significantly supported at the level of regional authorities, including through active participation in the implementation of such practices of political parties' regional offices (*United Russia, Communist party, Patriots of Russia*, etc.).

Moreover, this strategy of the regional authorities has borne fruit: young people consider themselves Patriotic, actively involved in such Patriotic practices, loves and is proud of the country, its heroic pages, but patriotism is not associated in its consciousness with the manifestation of active civic consciousness.

The consolidation potential of patriotism is used at the level of formal regional management practices in the regulation of inter-ethnic relations, in their harmonization, which is reflected at the regulatory level in the form of the adoption of regional programs aimed at solving urgent problems related to the manifestation of xenophobia, inter-ethnic and inter-religious intolerance.

The management formal aspects of the consolidation potential of patriotism, based on the values of statist, correspond to the informal Patriotic practices of everyday life, regulated by social structures and organizations, social institutions and social groups. They also contain at their core statist values, as they are rooted in the mentality of Russian society and its many peoples, including in the South of the country. However, the specificity of etatist patriotism in the South of Russia is the risks of nationalism, for which the regional space of this part of Russia is a fertile ground for the spread of ethno-phobia, ethno-nationalism, ethno-extremism, etc. Nevertheless, it should be noted that nationalist motives are typical for the whole of Russia, since a fifth of its residents agree with the statement that being a patriot means to believe that your country is better than other countries.

The stately and statist nature of patriotism in Russia and the South of the country in particular contributes to the fact that informal Patriotic practices are often transformed into formal ones, becoming part of regional management practices.

It is not about making a choice and necessarily abandoning the value of one type of patriotism with its consolidation potential for the sake of another. The formation of historical memory and its transferring through heroic patriotism in its military-mobilization design can be combined with everyday patriotism based on civil practices, but this requires a different paradigm of patriotism – not a statist, but a civil one. Its implementation requires appropriate conditions in the form of a high level of social subjectivity as a willingness and ability to take responsibility for what is happening in the country, confidence that it is possible to change something by individual efforts of citizens, but Russian realities, both at the level of the whole country and in the South of Russia, demonstrate the dominance of statist and paternalistic attitudes and values, when the state is recognized as the main actor of social change (Twenty-five years of new Russia, 2018). All hopes for change for the better, for solving social problems and socially important tasks are associated with it in the face of *strong power* (Toshchenko, 2016).

Discussion

The South of Russia is a poly-ethnic mosaic region with a complex ethnic structure and a rich palette of ethnic cultures, the history of interethnic relations at both the micro and macro levels. The history of each region that makes up the South of Russia has its own specifics of relations with the Russian authorities, derived from the history of inclusion in Russia, the presence/absence of interethnic and other clashes, conflicts, wars, traditions of interethnic interactions that have developed over the years of functioning as part of the Russian state. Moreover, the more important it is in modern Russia to create a platform for intercultural dialogue, the Foundation of Russian identity as the basis for inter-ethnic consolidation. In the years that followed the collapse of the USSR, when attempts were made to find a unifying national idea, only with the transition to the new Millennium it was possible to determine that such a platform, such a national idea can and should (according to V. Putin) become patriotism, throughout the history of Russia, which allowed the multinational Russian people to be one and successfully resist all risks, threats and challenges. The regulatory framework created for this policy is being carried out and its further development marks the formal consolidation of this course and determines the nature of formal management practices in the use of the consolidation potential of patriotism. We are talking about the state program for 2016-2020, in which the mission of patriotism is conceptualized in terms of a clear demonstration of the goals and objectives of Patriotic education aimed at strengthening the Russian state, ensuring national security, consolidation of Russian society, the formation of Russian identity and increasing civil responsibility. In one or another variation, but with the preservation of ideological and conceptual foundations, this program is implemented in all regions of the South of the country.

Thus, at the level of formal management practices in the South of Russia, traditional mechanisms of making patriotic population are implemented, associated with the reproduction of state patriotism, which does not define society itself as an important subject of patriotism, and therefore young people become just an object, albeit a key, of Patriotic education without taking into account the fact that the need for a subjective role has already matured, and educational measures of patriotism are not considered effective in the formation of patriotism (Vereshchagin & Volkov, 2017). Nevertheless, in the regional space of the South of the country, the formation of patriotism among young people takes place within the framework of the educational process, the basis of which is the program of Patriotic education of citizens developed by the state. Thus, in the South of Russia Patriotic practices correlated with state patriotism as typical for the Russian society, which traditionally developed within the conceptual boundaries of this type of patriotism, are successfully consolidated. It is based on the idea of the state as the most important value, the main object of Patriotic feelings of citizens and the key subject of management of Patriotic development of society.

In paradoxical borders of the state patriotism formal administrative practices in the field of patriotism formation in the youth environment of the South of Russia connected with the organization and development of the military Patriotic movement based on memory of the great Patriotic War are realized. Of course, Patriotic practices of this kind play an important role in the formation of historical memory, love and pride to their Homeland, but the dominance of this kind of military mobilization and heroic Patriotic practices among young people does not lead to the formation of ideas about how you can show patriotism in civil everyday life. Analysis of the most common Patriotic practices in the South of Russia actualizes this issue in the most serious way.

But what is remarkable, although natural, is the state type of patriotism in its military-Patriotic, heroic and mobilization orientation allows regional authorities to effectively cope with a number of key management functions focused on social integration and consolidation of regional society on the basis of common interests, values and regional identity; social mobilization of the regional community to achieve common goals, representation of the interests of regional society at the national level (Lubsky, 2019).

Another thing is that this type of patriotism, like national patriotism, in the Russian version - statist (Volkov, Vereshchagina & Lubsky, 2018) does not contribute to the solution of another range of functions of regional governance related to the protection of the interests of regional society; ensuring its social stability, social development, acceptable level and quality of life, as to solve these problems in modern reality requires a high level of civic consciousness, civil self-organization and social activity, and the state patriotism reproduces in the mass consciousness and social practices paternalism, which, as rightly noted by researchers, becomes a barrier to the development of inter-sector social partnership, creating a dependent mood of a large part of the population and a low level of social participation (Molodov, 2016). And, it would seem, that the consolidation of society, since the beginning of the XXI century, implemented in the format of state-Patriotic orientation, has brought its effective results in the field of unity of Russian citizens, the formation of historical continuity, but the cohesion of the population is not shielded from the destructive factors of consolidation in such a strategic key, which are manifested in the deficit of civil identity, trust in social and political institutions, low living standards and ineffective social policy, and in regional spaces with a complex ethno-social structure, which include the regions of the South of Russia, negative consolidation effects still occur, and they are associated with identification processes and ethno-nationalist trends. Moreover, in this situation, these negative consolidation trends are transmitted through informal channels of patriotism formation. In particular, we are talking about the family, which has the most powerful potential of *growing* patriotism, but uses its resources in the context of specific socio-cultural and socio-economic reality, formed social order. Therefore, in the conditions of socially un-oriented state, lack of protection of fundamental rights and freedoms of citizens (labor, education, decent life), the family is deprived of the opportunity to form at the level of consciousness of young people a deep sense of patriotism as part of the fate of the *big* homeland, as a willingness to live and work for its benefit and prosperity. In the context of the information society with its active means of manipulation of mass consciousness, mass media are entrusted socialization functions, but the emerging Patriotic attitudes on the basis of this agent of youth socialization acquire the character of situational, temporary and not expressed in behavioral strategies, as evidenced by the data on the high migration of young people outside the Russian state, as well as a high level of pragmatism and selfishness in labor, in work (Vereshchagina et al., 2015). "The Patriotic idea is born by the practice of being, in this sense it is the creation of everyday life" (Orekhovskaya & Orekhovsky, 2016) - these words of Russian scientists accurately reflect the above-mentioned, confirming the idea that the very reality of social life becomes an indicator of the value-ideological content of patriotism and behavioral practices that embody the level and nature of Patriotic attitudes formed in society.

Among scientists, however, there is a slightly different point of view, allowing to present the above described situation from the reverse side, when the solution to the problem of reducing the level of social consolidation of the Russian society under the influence of negative phenomena that thrive in it at the present stage (falling living standards, rising social inequality, corruption, legal insecurity of citizens, etc.) is seen through the use of the resource potential of patriotism (Rozhkova & Marshak, 2014).

Without disputing the legitimacy and justification of such an approach, we believe that unilaterally, without using other resources associated with improving the welfare of society, the level of its economic, social and cultural development, the formation of patriotism is transformed into a declarative practice that is not able to have a real impact on the deconsolidation processes in society, which have gone very deeply and expressed, including in the syndrome of tacit acceptance of the abnormal Russian reality, with universal recognition of the fact that in the post-Soviet period in the country, as twenty years ago, there are acute issues of mass poverty, social injustice and insecurity of the population, spiritual decline and arbitrariness of officials (Gorshkov & Petukhov, 2015). In addition, in the regional space of the South of Russia these negative factors are aggravated by contradictions and difficulties of ethno-cultural and confessional nature, which together hinder the social consolidation of the regional community.

Conclusion

Biological (by a development environment) hazards include natural fires and also invasions of allochthonous insects (locusts, Colorado beetles and others) and various diseases of animals and plants (epizootia, epiphytotia, etc.). At any time, patriotism was a significant value and resource of social development. In the most difficult times, it helped people to survive crises, wars and remain faithful to their country. Often this resource was used for unseemly purposes, directing the Patriotic consciousness of citizens in the direction of the struggle for ideals and values contrary to the values of humanism and the right of every people to national self-determination and Autonomous development. Thus, using the infringed Patriotic feelings of the Germans and the ideology of revenge, a fascist regime was created in Germany, which claimed countless human lives during the Second World War.

In other words, patriotism has a powerful potential to influence the mass consciousness, and it all depends in whose *hands* and how this *weapon of mass destruction* will be used. It can become extremely dangerous based on the cultivation of nationalist sentiments, and can become a source of spiritual revival of society and its successful development.

Management of patriotism and its potential for consolidation in the South of Russia is carried out mainly through formal mechanisms that define as a dominant the statist type of patriotism, which is based on military mobilization Patriotic practices that have received significant distribution and especially in the youth environment, actively involved in the military-Patriotic movement through educational channels, as well as under the influence of heroization of patriotism as the most powerful Patriotic trend in modern Russia. As a result of the actualization of military-historical memory and the construction of historical consciousness based on the heroic events of the past in the youth environment, an acute shortage of civic consciousness in the structure of patriotism is formed, which negatively affects the consolidation processes in the South of Russia in terms of overcoming the trends of negative (destructive) consolidation in ethno-cultural circles and communities.

Thus, management practices in the field of patriotism in the South of Russia based on the etatist paradigm are not able to solve the whole unit of functions and tasks of regional governance related to the problems of social consolidation of regional society and the protection of its interests. There is a need for a different, integrated paradigm of patriotism as a resource of management activities at the formal level and a reference point for activities at the informal level. It should be based on civic values and attitudes, but so far, this paradigm of civic patriotism can only be spoken about in the context of a promising project.

The Main Trends of Russian Business Travel Market Development

Marina A. Zhukova, Anna A. Larionova, Natalia A. Zaitseva, Olga A. Grunina, Oksana V. Takhumova, Tatiana A. Dvornikova and Elena N. Egorova

Abstract

The relevance of the article is determined by the fact that Russia as well as the rest of the world gives considerable attention to the process of developing business travel. This is related to its positive impact on the economies of countries that accept business travelers, since it is characterized by: independence from the season; high predictability; mass character; the provision of high-quality expensive services; promotion of the image and favorable reputation of the host region. The purpose of the article is to present the results of a study development direction of the business travel Russian market. To implement this study, the authors of the article used the methods of comparative analysis, content analysis, the method of expert assessments, methods of quantitative and qualitative analysis, data aggregation methods. The novelty of the research results consists in clarifying the essence of the scientific concept "Business travel", which includes the following components: business meetings and negotiations, motivational events (incentives), congresses / forums / conferences / seminars and events. The paper assesses the segment development prospects of business travel congresses / forums / conferences / seminars and event management. In the article, the authors stress that the sector is underestimated in Russia and significant growth in this area is possible. In addition, potential of Russian regions for the business travel industry development was assessed. Implemented study substantiates a set of measures aimed at further development of the business travel industry in Russia.

Keywords: business tourism,business travel,business meetings and negotiations, motivational events (incentives), congresses, forums, conferences, seminars ,events, business travel industry.

Introduction

Currently, due to the globalization and integration of the global economy, the business travel industry is developing at a rapid pace, and experts expect only an increase in business travel in the near future (Zaernyuk, Mukhomorova & Egorova, 2016, Veretekhina et al., 2017; Semenova et al., 2018). By 2020 the cost of business travel in the world is likely to reach 1.6 trillion dollars (Industriya vstrech kak drayver razvitiya ekonomiki, 2018). An interesting fact is that the number of business trips is hardly affected by economic and financial crises, environmental and political problems. For example, in the region in which there is a military conflict, many international organizations send observers, negotiators, delegations to resolve conflicts, representatives of humanitarian missions. All these travelers travel to the region for business purposes. In fact, business travelers are “ambassadors” of the host region, which contributes to its promotion in the international tourist market. Most of the business travelers make up the well-known and influential people that have an impact on the views and opinions of other people, forming their positive attitude to the host region and business events held in it.

It should be noted that the economic effect from the development of the business travel industry far exceeds many other investment projects. For example, according to experts’ investments in the development of the business travel industry give a multiple economic effect to the development of related industries (transport, trade, restaurant, hotel, advertising business). According to ICCA, each congress participant spends an average of 736 dollars per day, which is three times the cost of an ordinary tourist. Thus, at the expense of large business events the business travel industry allows replenishing the budget of the host region four times as much as the implementation of some other mass events.

In 2018, there is a continuation of the trend towards the recovery of the Russian business travel market after the crisis of 2014, which indicates a further strengthening of the position of business operating in Russia. At the same time, despite the tense relations with a number of foreign countries, there is a growing interest in the corporate segment to international business trips - companies are actively seeking global partners, including for expanding business outside Russia. According to forecasts of experts (Aeroklub, 2018) this positive trend will continue in 2019. Therefore, it is paramount now to clarify the conceptual apparatus of business travel based on the understanding of the nature of this type of travel, as well as its specific organization and on this basis to develop activities for further development in business industry.

Methodological Framework

To carry out the determination about the main trends and directions of development of the Russian business travel market we used methods of comparative analysis, content analysis, method of expert assessments, methods of quantitative and qualitative analysis, methods of data aggregation, classification and structuring of information, reference and statistical data.

The study of the business travel development problems was performed using the following sources of information: materials of scientific conferences, scientific publications on business travel; analytical reviews, ratings of professional agencies.

Literature Review

In Russia, the term "business tourism" is often used in regards to temporary business trips and trips for official purposes, including participation in conferences, congresses, etc., without generating income at the place of business trip (Sineva, 2016; Milinchuk, 2017). Unfortunately, this definition does not quite accurately reflect the specifics of business travel for some reasons: in international practice, the term "business travel" is used to define this type of travel. The business traveler can receive income in the place of residence / business trip (for example, the speaker at the conference from the meeting organizer or sportsperson as a fee for competition win).

Therefore, in our opinion, it is more expedient to understand business travel as travel for business purposes, including preparation of tourist travel programs; installation of equipment; participation in meetings, conferences and congresses, trade fairs and exhibitions; inspection, procurement; contracting for accommodation and transport; sales of products, works and services to foreign enterprises; incentive trips for employees of enterprises; lectures and concerts; working as guides and in other positions in the field of tourism; participation in professional sports events; government travel (Zhukov, 2013).

Currently, in the literature there are different definitions of business travel, for example, "business travel", "an industry I meet", "industry meetings and events", "industry congresses and incentive measures", "industry meetings, corporate and incentive events", "industry event management and incentive activities".

Analysis of the above definitions allows us to conclude that the scope of business travel includes the following components: business meetings and negotiations, motivational events (incentives), congresses / forums / conferences / seminars and events.

Results

4.1. Organizing Companies for Congresses / Forums / Conferences / Seminars and Event Management

Overseas, organizational structures / companies are actively functioning in the market of business consolations, whose functions are strictly demarcated when organizing business events (Guliyev, 2017):

– meeting planners are involved in planning and organizing corporate events (determine the place, time and nature of the event, calculate the budget of the event);
– professional congress organizers (professional congress organizers) provide services for corporate events (congresses, conferences, incentive travels);
– destination management companies, specialized in the reception and service, and business delegations and groups in the venue;
– congress offices (congress/convention bureau) are engaged in attracting various business events in the region.

In essence, these organizations in the course of joint, coordinated work provide the substantive and technical parts of all business events held in a particular region. Thus, in international practice, only specialized organizations are engaged in servicing business travel.

There are also a small number of professional Russian companies in Russia that specialize in providing a full range of services for business travelers (Aero Club, UTS, Concorde group of companies and others).Congress bureaus have been established in a number of Russian regions (Moscow, St. Petersburg, Yekaterinburg, Sochi, and others).

In November 2017, the National Congress Bureau (NCU) was established in Russia with the support of the Government of the Russian Federation to develop exhibition, trade fair and congress activities, as well as integration into the global business travel industry. The key activity of the NCU, within the framework of the fulfillment of the national goals and strategic objectives of the Russian Federation, is to attract more international congress and exhibition fairs to the country and to form a positive image of Russia as a country with a favorable business and investment climate.

Since the founding of NKB Russia under the brand "RUSSIA OPEN TO THE WORLD" was presented at four major international industry exhibitions, such as "IBTM World" in 2017 -2018 Barcelona, «IMEX 2018" in Frankfurt and «IBTM China 2018 "in Beijing. The founders of the Association are: Roscongress Foundation; JSC "Russian Export Center"; International Fund for Technology and Investment (International Foundation of Technology and Investment, IFTI); Exhibition Research Center R&C.

During the first year of operations in Russia NCU 4 major international events have been held, the overall economic effect of the conduct of which will be about 5 billion rubles. In addition, the amount of tax revenue has exceeded 550 million rubles. Additionally, 9 more events are under development. With potential participation in them, 16700 people, the total economic effect may exceed 7 billion rubles. (Natsional'noye congress – byuro predstavilo na press – konferentsii itogi pervogo goda deyatelnosti, 2018).

4.2. Development of Activities of the National Congress Bureau

At the same time, it should be noted that, at present, the reserves of the NCU's activity have not yet been fully realized; further directions of its activity should be directed towards:

– development of infrastructure and material and technical base of the regions, development of common industry standards (Radzhabova & Amiraliyeva, 2017);

– attracting and conducting not only large events but also international industry and research activities with the number of participants of 200 persons and above. It will give a significant impetus to change the infrastructure of the country and has a social effect: airports, train stations , roads, landscaping, construction of sports facilities, increasing the level of hotel services and other services, all this remains after the events to the residents of these regions and undoubtedly improves the quality of life of the population;

– increase the share of Russia in the international market of business travel - up to 1.7% (currently 0.46%), improving the country's standing in international rankings of exhibition-fair and congress activities and the increase in the contribution to GDP of the Russian Federation at the expense of attracted international business events (Radzhabova & Amiraliyeva, 2017);

– the creation of regional convention bureaus, development regions passports, which will act as a starting point for engaging in activities to Russian regions leading industry and may become a flagship for the concentration of efforts on attracting events, taking into account the sectoral specialization of the region;

– visa support for participants of business events (shortening the time for obtaining a business visa);

– development of the system of subventions for the events (i.e. state financing regional business events - conferences, exhibitions, fairs, etc.);

– the use of the ambassadorial program for the promotion of a destination, i.e. not individual companies, products or services, but an entire country or region as a venue for business events. These programs include regularly disseminated information about the advantages of traveling first in Russia, a country used the features that a business traveler wants to see and feel.

4.3. Assessment of the Potential of Russian Regions for the Development of the Business Travel Industry

In order to identify the development potential of the business travel industry in the Russian regions Specialists of the R&C Exhibition and Research Center (VNIC R&C) (Natsionalnoye kongress-byuro predstavilo na press-konferentsii itogi pervogo goda deyatelnosti, 2018) made a rating of the Russian regions potential for the of the business travel industry development by the end of 2017. Saint Petersburg occupies the first place in the rating, as the city hosts major international business events annually (Table 1).

Table 1. The top five Russian cities with the highest rating in attracting exhibition fairs and congress events

City	Largest sites	Major organizers	Recreational possibilities, experience of major events
St. Petersburg	**CEC "Expoforum"** (closed area	LLC "EF-	7000 cultural heritage sites.

	- 50 thousand sq. M, open area - 40 thousand sq. M, the number of pavilions - 3, 25 conference rooms, accommodating 10 thousand people., **CC "PetroCongress"** Indoor area - 3150 sq. M, convertible conference room up to 300 people., 8 conference rooms with a capacity of 10-150 people., 4 meeting rooms	International, LLC VO RESTEK, Primexpo	Over the past five years, more than 100 events held by major international associations
Ekaterinburg	**IEC "Ekaterinburg"** Closed area - 50 thousand sq. M, open area - 60 thousand sq. M, number of pavilions - 4, 8 conference halls, 7 meeting rooms	LLC "UralExpo" LLC "Uralexpocentre - Eurasian Exhibition Holding"	Industrial and theater center of Russia. Over the past five years, 9 major events held by international associations
Sochi	**Main Media Center** Closed area -158 thousand square meters, 5 conference rooms with a capacity of 50-450 people.	PA "SOUD-Sochi exhibitions" Sochi-Expo CCI Sochi LLC	The largest alpine resort. In the last five, 14 events of international associations took place.
Krasnodar	**VKK "Expograd South"** Closed area - 35.6 thousand square meters. m, Open area - 20, 8 thousand square meters, the number of pavilions-4, 5 conference rooms	Krasnodar EXPO" (IT Co. Expo)	Protected Areas, included in the program "Gastronomic map of Russia"
Kazan	**EC "Kazan Fair"** Closed Square -. 6.7 thousand sq open area - 12 thousand sq. m, the amount of pavilions-3.8 conference rooms, 4 meeting rooms	OJSC "Kazan Fair"	Kazan Kremlin, Bulgarian historical and archaeological complex. Over the past five years, 17 events of international associations have been held.

In 2018, St. Petersburg held International Congress of the World Association of the Exhibition Industry (UFI). Second place occupies Ekaterinburg. This region pays great attention to the improvement of specialized infrastructure, which is necessary for the full business travel industry development. In the near future, construction of a congress hall, meeting international standards and designed for 4.5 thousand people, will begin at the Yekaterinburg-EXPO site. The third, fourth and fifth places are occupied by Sochi, Krasnodar and Kazan. In 2017 Kazan began to work on "Convention Bureau of the Republic of Tatarstan", which will further promote the development of business tourism and attract investment to the region.

Among the cities in the TOP-10, Ufa strengthened its position most significantly, rising from 11th to 8th place. In 2017, the Congress Bureau of Bashkortostan carried out active work on promoting the republic's potential, which resulted, in particular, in winning the bid to hold the Apimondia Congress of Beekeeping Associations and the ApiExpo exhibition in 2021.

The TOP-10 is closed by Chelyabinsk, where in the coming year's major international sports and business events are planned to be held: the World Junior Hockey Championship, the BRICS and SCO summits in 2020.

In addition, for the modern period of business travel industry development in Russia there is a tendency of increasing attention of regional administrations to the branding of territories. In 2017, the winners of the first National Territorial Marketing and Branding Prize were announced by the 'Stas Marketing' with the support of the All-Russian public organization Business Russia. Image symbolism of Murmansk recognized as the winner in the nomination "The best brand of the city" (Kankulova & Reshetnikova, 2017). Besides, work on the creation and implementation of brands is implemented in Nizhny Novgorod, Voronezh, Irkutsk, Tyumen and Ryazan. In the future this will allow the city to strengthen its position in the tourism market, as well as to increase recognition in the field of exhibition and fairs, governmental and congress events in the Russian Federation.

In addition, experts (Guliyev, 2017) point out positive trends for the development of the business travel industry in Khabarovsk. In 2017, the government of the Khabarovsk Territory announced the development of a "Concept for exhibition, fair and congress activities until 2025," which indicates the interest of local authorities in the development of the region's business travel industry.

In this rating, Moscow was not taken into account by specialists as an element causing a strong imbalance and distortion of data. According to ICCA, at present Moscow is in the TOP-100 congress destinations of the world and in the TOP-50 of Europe. Since 2013 promotion of the city as congress-fair center is engaged in the Moscow Exhibition and Convention Bureau. In Moscow, three sites are used for large-scale business meetings: Crocus Expo IEC (indoor exhibition area - 215.9 thousand square meters, open exhibition area – 219 thousand square meters, number of pavilions - 3, 49 conference halls); Expocentre Fairgrounds (indoor exhibition area - 105 thousand square meters, open exhibition area - 60 thousand square meters, number of pavilions - 11, 32 conference halls), VDNH EXPO (indoor exhibition space - 39.3 thousand square meters, open exhibition space - 65 thousand square meters, number of pavilions –2, 12 conference halls). The largest organizers of events in Moscow are Expocentre JSC, ITE Expo LLC, Crocus International JSC.

Despite certain successes of Russia in the business travel industry development, nevertheless, Russia still lags significantly behind such countries as the USA, Great Britain, Germany, Canada, and Thailand (table 2). According to ICCA, in the European ranking of countries in terms of the number of events held, Russia ranks 22nd (Industriya vstrech kak drayver razvitiya ekonomiki, 2018).

Table 2. Share of business travel industry in the economies of countries (Industriya vstrech kak drayver razvitiya ekonomiki, 2018)

A country	Share in GDP,%	Absolute Values
USA	2.20	393 billion
Great Britain	2.90	71.7 billion
Germany	1.70	52.6 billion
Canada	1.80	23.7 billion
Thailand	0.60	6.4 billion
Russia	0.046	250 million

According to ICCA, not more than 600 out of 7,000 international professional associations held events in Russia, at the same time, according to expert estimates (Industriya vstrech kak drayver razvitiya ekonomiki, 2018).

Russia can host more than 8,000 congress and exhibition events, which testifies to the underestimation of this sector and its growth opportunities.

Discussion and Conclusion

Some authors (Zaitseva et al., 2018), already wrote about the development of business tourism, in particular about the features of the development of MICE - tourism, about the development and business tourism in the Baltic region in the framework of cross-border cooperation, the article (Zaitseva et al., 2018) gives an overview of the state and prospects for the development of business hotels in the Russian Federation. The proposals and recommendations set out in the article are characterized by originality, because they contain an analysis of the trends of Russian business travel industry development. This research summarizes the experience of development in Russia, in particular such components of the business travel industry, such as exhibition, fair and congress activities.

This study allows us to conclude that for further development of the business travel industry in Russia the following areas require specific activities:

– The presence of state support, the development of public-private partnership in the field of business travel;

– Forming an attractive image of Russia, developing the experience of holding major events (sports, cultural, entertainment, business, government), branding Russian cities;

– Formation of economic and political stability, implementation of measures to provide security in the country for travelers;

– The formation of the professional structure of the organization involved in promoting the capabilities of the Russian regions in receiving and organizing exhibitions, fairs and congress events (regional congress bureau, information and tourist centers);

– Development of transport infrastructure, accommodation facilities oriented to business travelers (congress hotels, hotels with international standards of service and price / quality compliance);

– Availability of modern congress and exhibition centers, centers of international trade, the necessary amount of exhibition and congress areas;

– Using digital marketing to promote Russia as a major center of the business travel industry to boost sales, increase brand awareness and create certain positive trends;

– Training specialists for the business travel industry, developing professional development programs focused on the features of the business travel industry;

– Collaboration with NBC Russian professional Association for attracting major events in Russia;

– Participation of representatives of the National Security Committee of the Russian Federation in international exhibitions and fairs, conferences, forums dedicated to the development of the business travel market;

– Russia's membership in international and national associations, associations specializing in the promotion and organization of exhibitions, fairs, congresses and other business events;

– Conducting statistical report on the business travel industry functioning in Russia.

The application of recommendations proposed by the authors of the article will contribute to the development of business travel in Russia, increasing the efficiency of development and application. The materials of the article are of theoretical value for research in the field of business travel research, and practical value in the implementation of business travel industry development programs.

Social Investment Model of Regional Management and Its Realization Peculiarities in South of Russia

Yuriy G. Volkov, Anna V. Vereshchagina, Zaur A. Zhapuev, Baburi B. Meskhi and Alexander V. Popov

Abstract

The social and investment model of regional management is the most optimal and effective mechanism for the development of regional society, since it is focused on the formation and development of organizational, regulatory, structural, cultural and managerial skills of regional management entities in the system of regional management, contributing to the increase of social and investment potential of regional society. The system of regional management of Russia identifies the preconditions for the formation of a social and investment model as an alternative to the existing transfer and raw materials approaches, but the regional specificity in the development of this process is noted. The study of the regional experience of the South of Russia makes it possible to state that in the space of this region, taking into account the diversity of natural, climatic, social, economic, cultural and historical factors, intra-regional specialization is positive, which aims to eliminate unhealthy competition, reduce of transaction costs and specialization within the framework of social resource nature (the level of human capital development).

Keywords: management, region, regional management, social and investment model, social and economic development, South Russian region.

Introduction

The dominant model of regional governance in Russia is related to the preservation of administrative, political, legal and financial mechanisms of social stability and order. However, the deterioration of financial and economic indicators (half of the entities of the Russian Federation (43 regions) finished the current year with a budget deficit) deserves close attention, as it has the prospect of becoming a systemic problem of regional governance. This means that when forming a model of regional management one should take into account the positive experience of regions with sustainable social development, identifying points of growth and perspectives of the transition to a social investment model of regional governance, with the aim of enabling mechanisms for the investment of financial and intangible resources in the regional society, support and development with rootedness and socio-economic perspectives for the region models of regional governance. The social and investment model of regional management is of particular importance, as it is an adequate response to internal and external challenges, predetermining changes in the strategy and tactics of management decisions.

The relevance of this study, firstly, is due to the trends of socio-economic and social development of the regions and, as a result, new requirements for the system of regional governance. Secondly, due to the strategic objectives of the implementation of social and investment policy priorities in regional management. Third, due to the need for scientific justification and methodological toolkit for study the processes of regional management in the framework of strengthening the effectiveness of the current management system. All of the above-mentioned is associated with the implementation of the social and investment model of regional management, the experience of the organization, which is not conceptually justified or analyzed in detail in Russia.

Noting that the system of regional governance in Russian society hardly and sometimes contradictory transfer to the socio-investment model, it should be borne in mind that the Russian regions are heterogeneous in natural, climatic, socio-cultural, economic, socio-territorial indicators that the hierarchy of the status of the regions is based mainly on financial and economic parameters and inter-budgetary relations. Therefore, it is important to address the specifics of the formation and implementation of regional governance's socio-investment model in the South Russian region. This choice is conditioned by the fact that the South Russian region, firstly, is the middle, that the entities of the Russian Federation, included in the South Russian region, are heterogeneous in terms of economic development, of the degree of interaction with the Federal center, having common characteristics of administrative and legal regulation and problems related to the quality of human resources.

Materials and Methods

Conceptually, the foundations of the social investment model of social management were laid in the works of R.L. Ackoff and F.E. Emery (2012), M. Armstrong (2012), C. McNamara (2008), in which the human factor is considered as the main element of the effectiveness of the management system. In the works of B. Waterman and T.B. Peters (2010) this provision is empirically justified. The motto *management not things, but people* is an attempt to consider the management system not through individual technological and socio-structural characteristics, but organized, programmable society.

Other foreign researchers were also engaged in the problems of regional governance, including in the context of modeling and finding ways to improve socio-economic relations in the regional space by optimizing the mechanisms of regional governance and development (Bures & Tucnik, 2014; Gilbert, 2008; Krugman, 2000; Minstry, 2007; Barro & Sala-i-Martin, 1991), while in Russian science these aspects with an emphasis on the social and investment component of regional governance were reflected in the writings of A.B. Tikhonov (2017), V.V. Radaev (2003), N.E. Tikhonova and M.K. Gorshkov (2018), Yu.G. Volkov and V.V. Krivopuskov (2013), V.A. Putilov, A.V. Masloboev and V.V. Bystrov (2017), V.V. Shcherbina and E.P. Popova (2017).

The concept of the socio-investment model of the regions' management was defined in the early 2000s (Popov, 2009; Bobrovsky, 2000; Gavrilov, 2002), but the understanding of this problem is actualized in the conditions of the limited model of transfer management and the aggravation of regional disparities between the subsidized regions and the donor regions, the need for socio-innovative development of the regions and the reduction of the areas of innovation economy and the reduction of adaptation costs (Davoudi et al., 2018; Fartash et al., 2018).

Results

As the results of sociological studies show, the population evaluates the activities of the regional administration on the quality of public services in the field of employment, access to quality education, quality of health (Capitals and regions in modern Russia: myths and reality fifteen years later, 2018). Investments in human capital in the South Russian region can be traced at the level of interest in the development of the region's basic socio-economic segments. We are talking about the rebranding of industry, tourism, logistics (transport infrastructure). The majority of the region's entities are characterized by a sufficiently high degree of deterioration of social infrastructure (60%). At the same time, within the southern Russian macro region, one can talk about the differentiation of entities into leading (Krasnodar region), *middle* (Rostov, Astrakhan region), depressive (Volgograd region, Kalmykia) (Prospects for investment development of the region (for example, Rostov region), 2018). In this context, the social and investment model of regional development should be based on the totality of objective parameters and management resources corresponding to the task.

A serious challenge is the need for radical modernization in the southern Federal district of agricultural and industrial economy, which is characterized by low (even by Russian standards) productivity, weak susceptibility to innovation. For many objective reasons, the post-industrial transformation of the economy may face a number of specific difficulties here, and perhaps its implementation will be slower in the southern Federal district than in other Federal districts of Russia. The most important internal threat is the loss of the former attractiveness and prestige of the South Russian regions for living. In the new conditions of development, many South Russian resorts were uncompetitive, losing in terms of price and quality Turkish, Croatian, Greek and Montenegrin counterparts. Objectively positive effects of natural factors can be neutralized and even annulled by the poor state of social, leisure and transport infrastructure.

One can state that the priorities formulated at the level of the Federal center, focus on overcoming the backlog and neutralizing internal and external threats to regional development, which focuses the attention of regional management on administrative and legal regulation. In this context, it is important to assess the socio-investment model of regional governance in terms of ensuring regional and national security, as well as increasing the socio-investment attractiveness of the region through the growth of economic indicators.

The Rostov region, as the middle region in terms of the all-Russian indicator, demonstrates the advantages and difficulties associated with the implementation of the social and investment model of development. Based on the fact that regional governance in the Rostov region is characterized by a sufficient level of continuity and reliance on local regional elites, we can say that there are prerequisites to consider the model of regional governance implemented in the Rostov region authoritarian, set up for tight control of the regional society (Nesterova, 2012).

However, one cannot rush to the conclusion that the regional office uses only administrative resources. Indeed, management practices in the Rostov region can be described as socially coordinative and socially developing. The regional office has not reached the position, which with confidence can be defined as socio-developing. Unlike the leaders of social and investment development, the regional office announced the transition to the social and investment model only in the last two or three years. The emphasis was placed on identifying approaches to solving the problems of social and investment development through socio-developing practices associated with increasing economic activity and economic investment in the region. This was reflected in the fact that the regional management system of the Rostov region during 2014-2016 years actively presented the project to increase economic investment in the region. The difficulty was that in the conditions of the sanctions regime, the plans to attract foreign investors turned out to be quite illusive. That, as noted earlier, was not a strong incentive for social and investment activity due to the preference of foreign investors for urgent projects and focus on cheap labor.

It is noteworthy that if we rely on the criteria of qualitative assessment, which are combined into three groups: the institutional design of the investment model, regulatory centralization and accounting system of social activities, then the system of regional management has not yet advanced the first group of criteria related to institutional management in the socio-investment model; but at the same time, the system of social shares has become regular. The point is that the position of coordination of management structures' activities and various public funds and social associations is actively promoted. This is evidenced by the fact that in the system of regional governance it has become the norm to hold consultations with representatives of civil society on the formation and implementation of projects aimed at improving the quality of human resources.

Within the framework of the South Russian region, the Krasnodar region is the undisputed leader in such components of the investment potential as labor, consumer, production, financial, institutional, infrastructure, tourism. This situation is superimposed on the reproduction of the scheme *from the achieved*, as a result of which the Rostov region, as it is shown by expert assessments, without experiencing the influence of management changes, characterized by an attitude to social innovation as dependent only on the management factor, occupies an unstable position in the investment rating of the regions (25-26 places, respectively, according to the assessment of social and management factors) (Prospects for investment development of the region (for the example of the Rostov region), 2018).

In this sense, the starting point is the understanding that human resources are the trigger of economic activity. The region has almost exhausted the expansionist option of increasing resources: there is a pendulum migration associated with the high outflow of young professionals and young workers to the capital and Krasnodar region, and compensation is due to the arrival of the rural population, in particular young people. However, because the rural population has a lower degree of capitalization of educational and professional resources, there are barriers to economic projects.

Since there is no rental economy in the region, the transition to the social and investment model is conditioned. Nevertheless, there are difficulties associated with overcoming the view of social investment as a matter of business structures themselves. Since large state corporations do not operate in the region, the hope rests on small and medium-sized businesses that are not able to independently implement social and investment projects. Therefore, there was a chain of administrative interaction: the structure of the regional administration, social funds, and business structures. In this context, social funds are not only competitors of the regional governance system. As the experience of the last five years shows, the priority is the implementation of projects that transfer certain managerial and Supervisory functions to social funds in stimulating business structures to invest in the development of human resources.

The socio-investment model in the Rostov region corresponds to its middle position in the hierarchy of regional statuses, revealing typical problems associated with the fact that in the region, relying on industrial potential, there are inevitably problems of an economic nature, associated either with the modernization of existing production, or with the construction of new facilities. The second problem is that the regional labor market is still too narrow to work on training specialists with advanced knowledge.

The constraining factor is that the social and investment model of regional management is included in the solution of actual social problems that is connected with reproduction of human resources on an old basis. There was no breakthrough in improving the quality of human resources, as well as in the formation of a system of regional management for the implementation of quality social services. If we compare the management mechanisms in the Rostov region and Krasnodar region, the ratio is in favor of the Rostov region, as there is a targeted program to increase the economic attractiveness of the region, while regional management in the Krasnodar region is based on the use of social and territorial advantages of the region. However, this does not create a competitive effect, as the administrative resource in the form of support by the Federal center of Krasnodar region is higher than in the Rostov region.

It is important to understand that it is impossible to succeed in the spatial development of Russia if the strategies of the regions developed in the regional management system are not coordinated on the all-Russia scale. Based on this obvious situation, it can be stated that the transition to the social and investment model in the South Russian region is quite isolated, spontaneous, since there is a gap between participation in Federal targeted programs and the desire of regional management to social and investment activity. In this regard, G. Kleiner (2018) notes that in regional development the cooperation is as important as competitiveness, competitiveness should be combined with the ability to conclude and implement long-term agreements with partners and society as a whole. In the southern Russian region, competition has negative consequences that led to the collapse of small and medium-sized businesses. It turns out that if the region is not based on raw material one, the main burden falls on small and medium-sized businesses, so you need to think about the extent to which small and medium-sized businesses can play a role in the deployment of social and investment model of development.

Thus, in the long term, the implementation of the socio-investment model of regional governance in the South Russian region is based on increasing the level of cooperation within the region to create a resource of social lending in order to develop a system of human resources' investment with limited impact of economic efficiency.

Discussion

In the system of regional management, the socio-investment model has the effect of changes in the management culture, the motivation of the actors of the regional management system. Often the General provisions that the system of regional governance should take into account the interests and needs of the regional society in reality means that self-motivation, self-determination in the system of regional governance may come in line with the interests of the regional society, considering the improvement of human resources' quality and socio-investment policy as increasing the reputation capital of the management system and the possibility of building bilateral relations with the regional society, or as experience convinces, to see in the social-investment model only an opportunity to follow or a fashion project.

In this sense, the self-determinants of the socio-investment model of regional governance are based on three levels. The first is norms and rules within management relations. The second is the focus on social investment as a sense of management activity. The third is the practical importance of the socio-investment management model to improve the efficiency of regional management in the perception of regional management actors. Considering each of these aspects, it is necessary to pay attention first of all to the fact that the existing system of internal management relations, based on official subordination, implies social and investment activity as exclusively formalized, not contradicting the basic canons of management activity.

In the current system of internal management relations, personal independence is permissible, permitted, regulated, and social investments should be transferred to the discourse of communication, fit into the reporting criteria, belong to the document management system (this is the world of non-public people, 2016). If we concretize these provisions, then the self-determinants of management activity are manifested in the fact that social investment can be considered as part of improving the adaptability of the management system and contain criteria for maintaining the system of regional management, which excludes the introduction of indicators that do not depend on intra-management relations. It should also be borne in mind that N. Luman (2004) has revealed the possibility of translating the language of external requirements into the language of the management system and the corresponding management scheme.

When it comes to social investments, the most trivial is the organizational effect, the creation of a new structure aimed at strengthening the influence of the orderings power, which has developed in intra-management relations. This can be associated with the satisfaction of certain career ambitions, but in the first and in the second cases it is a question that the socio-investment management model is perceived bureaucratically and contains opportunities for social coordination practices that fit into the system of intra-management relations. Intra-management relations in the socio-investment model need to move to the model of group interaction, to the formation of functional interdependencies based on the criteria of compatibility and the overall usefulness of the actors' actions of the regional management system.

Focusing on the institutional settings governing social and investment management influence, it should be noted that in the internal management relations, there are disciplinary rules, that is, social and investment behavior cannot go beyond corporate management ethics. Speaking about this, it should be noted that for the regions with the emerging social and investment model of regional management, it is important to adopt management changes that hinder non-adaptive changes. It is important to create a common organizational climate that allows determining the cooperation of intra-management relations aimed at achieving a positive result.

Based on the organizational reality, the basic institutional focus of the regional management model include improving the efficiency of interdependent management groups. These actions require both the improvement of technical skills for the effective implementation of the tasks, and the improvement of interpersonal and social competence of employees in the system of regional management. Concretizing this provision, we can say, firstly, that the actors of regional management have a certain level of social competence, which allows solving the problems of administration, but as the analysis of regional management elites shows, the dominant age, is the average age of 35-50 years. These are people of social energy, career prospects, the desire to update knowledge, sometimes limited in a sense of novelty, renewal (this is the world of non-public people, 2016).

Every second actor of regional governance is cautious or negative about organizational change. The logic of such moods is based on the fact any organizational changes open up opportunities not only for growth, but also for loss of status or, in the worst case, of work. In addition, we have to go through the way of acquaintance with new tasks, which is difficult for people with management experience, with a sense of their own professional competence. Probably, the internal management relations in which the principle of subordination, rigid control of the management acts, complicate possibility of transition to focus on innovations as they assume the competition of the internal management environment, acceptance sometimes painful personnel decisions.

Under the influence of informal relations and rules, consolidation of clan groups and interest groups at the working level, the best option for the formation of new institutional attitudes is either an order from administration, which implies a quiet resistance to managerial innovations, or a radical restructuring associated with the arrival of a new team, embodying the idea of social and investment functioning of regional management.

The analysis reveals that in the development of the Rostov district as a region there are difficulties due to internal regional competition and underdevelopment of intraregional cooperation, where a certain positive would make the achievement of affiliation between the Rostov region and the Krasnodar region. Regional office in Rostov region, of course, lags behind, as the past period of stagnation led to a deterioration in the quality of human resources that is associated with the outflow from the capital in the Krasnodar region. It should also be noted that in the regional management system there was a rather painful period of a new management team's arrival, where the obstacle was the distance between the newly appointed managers and regional elites.

Bringing the system of regional governance in the Rostov region into a state of order has led to a lack of attention to the socio-economic development of the districts and cities of the region, and although in the last five years there has been an intensification of efforts to increase the investment attractiveness of the region, in principle, there have been no fundamental changes for the better. Such a pattern can be seen in relation to other medial regions of Russia, where, despite appeals to take into account the specific, often obviously ambitious models of regional development are formed, which are relevant performance criteria, but not the quality (Abramov, Mukhaev & Sokolov, 2017).

The social and investment model formed in the Rostov region has passed the period of social coordination and is legitimized in the vertical of regional management. To enable social investment governance arrangements for the solution of large-scale strategic objectives requires gradual cadre revolution and the formation of specialized social investment structures in the regional management system that performs custom for social design and social strategizing in the development of the regional society.

Conclusion

The institutional attitudes of the actors of the regional management system are based on the principle of low cost, that is, problem areas, tied to the efforts to create a labor market and provide high-quality professional vacancies, are difficult to solve. Clearly, this simplified approach contains elements of the simulation of the socio-investment model. The dissatisfaction with the current activities of the regional management system is recorded really, but, as it is noted earlier, the criterion of reliability of management and in General the desire to be good performers of the tasks of the Federal center leads to the fact that the social and investment model focuses on the head of the region responsible to the Federal center.

Until now, Russia has not formed a modal image of the Manager. Associated with this are the difficulties of developing behavioral codes that combine the tradition of administrating and the novelty of investment. This transition to the social and investment model of regional management is dictated by life itself, when in the conditions of compression of rental and transfer models the emphasis should be placed on human potential, capable of making changes to the existing model of management relations, so that in the regions there was a search for the most promising segments of regional development, for example, the prospect of introducing *green economy* projects.

The socio-investment model is not legitimate in the management space, which is a long way to realize the impact of social investment on the introduction of social and technological innovations. In Russian society, human resources management is associated with the actions of private or public corporations, determined by the criteria of management culture, management style, the nature of intra-management relations. With this right approach in general, it is necessary to take into account that the actors of regional management are officials, that is, perceive social and investment activities through the prism of the existing attitudes for the implementation of departmental Executive functions.

Therefore, it is important that the socio-investment model would be based on the acceptance by the regional management system's actors of the idea of human resources' saving and development, on the interpretation of social development of the region as the development of the population. This is confirmed by the analysis of the state of social and investment model of regional governance in specific regions of the Russian Federation. The diagnosis of the state and implementation of the model under study in the South Russian region, where there are no conditions for the rental economy, mitigating the relevance of social investment, is of great importance.

The experience of implementing the socio-investment model of regional governance in the South Russian region is also interesting because the regional environment, including the region-wide (modal) parameters of development, is associated with the specifics of the *borderland*, the existence of *multiplicity* within the regional space. Therefore, the existing intra-regional relations and models of interaction with the Federal center determine the implementation of the social and investment model of regional governance. In this context, the leadership positions of the Krasnodar region, determined by territorial, financial, organizational resources and inclusion in the Federal target programs, are fixed at the level of intra-regional expansion and, despite intra-regional competition, have a positive value in eliminating intra-regional imbalances. In the Rostov region, the management team focuses on the use of intellectual and logistical potential, at the same time making efforts to develop the social infrastructure of the regional space (*Eurodon* projects, the formation of a network of supporting universities, the development of logistics). However, the negative consequences of intraregional competition and the high level of transaction costs associated with duplication of social and investment projects in the context of insufficient intraregional cooperation have not been eliminated. Therefore, one can state that in the South-Russian region there is an intra-regional specialization that requires coordination of social and investment activity within the intra-regional space.

Improvement of the Development System of The Personnel of Organizations of the Oil and Gas Sector of the Economy

Mikhail V. Vinichenko, Oxana L. Chulanova, Dmitry S. Klementyev, Marina V. Rybakova, Maksim A. Malyshev, Valentina Ju. Shalashnikova and Daria A. Korosteleva

Abstract

The article discusses the issues of improving the efficiency of the organization of the oil and gas sector of the economy through improving the system of personnel development. Based on a system of methods, the main of which was an online survey and a focus group using the Likert method, the authors analyzed the results of the obtained studies. It is revealed that the personnel development system is most successful in dealing with ordinary employees. The development of management personnel has problem areas, which leads to an increase in staff turnover in this category, who have been trained during development, to human and financial losses for organizations. The main advantage of the article lies in the fact that the nature of the development of management personnel is considered in the system of development of the personnel of the organization as a whole with the identification of the nature of the losses of the organization. The authors propose that managers of organizations pay closer attention to the development of management personnel. It is more technological to work with promising employees of the management cohort, focusing on the development of his soft skills. It is necessary to improve the personnel evaluation system in the formation of a personnel reserve, to improve the socio-psychological climate in the team, motivational mechanisms, to ensure career growth. The harmonious development of all elements of the staff development system will serve as a pledge to improve the competitiveness of the organization.

Keywords: efficiency, staff development, management personnel, satisfaction, loyalty, talent pool, talent management.

Introduction

In the modern world, human potential is increasingly in demand by owners and management of companies in achieving victory in competition. Linear and HR management seeks to maximize the use of all available resources (Ushakov, Vinichenko & Frolova, 2018), primarily human (Kalimullin, Yungblud & Khodyreva, 2016; Buley at al., 2016). In conditions of high dynamics of development of all sectors of the global economy, an acute need for personnel development becomes evident. It is the personnel of organizations that ensures high performance in achieving superiority over competitors in the market for goods and services. Therefore, the views of heads of organizations are directed towards systems for the effective selection of well-trained personnel, the acquisition and development of professional and managerial skills and competencies among employees (Feng & Boyle, 2014; Semenova et al., 2018; Yumatov et al., 2017; Tsitskari et al., 2017).

Scientists propose various approaches to personnel development (Bazarov & Eremina, 2007; Ilina et al., 2018), analyze the experience of various organizations in achieving success in the development of their employees (Sears, 2003), social interaction (Frolova et al., 2016), skills their confidence in the authorities (Ficke, Wuryaningrat & Elvinita, 2015). At the same time, the peculiarities of working with young people (Vinichenko et al., 2017; Demchenko et al., 2018), obstacles in personnel development (Blossfeld & Huinink, 1991; Kataeva at al., 2015; Chulanova & Korosteleva, 2017), unfair approaches to higher positions (Mysnik & Marchelya, 2014; Francis, 2017), in obtaining the desired dividends (Belousova at al., 2016).

Scientists and practitioners are actively searching for technologies to identify, develop and use the most talented managers and specialists in the domestic and foreign labor markets (Bednova, 2014; Effron & Orth, 2014; Mironova at al., 2017; Chulanova & Mokryanskaya, 2017), a real battle for talents is underway (Michaels, Handfield-Jones & Ekselrod, 2006; Schweyer, 2004; Robertson & Abbey, 2004). Some companies use technologies that are combined by such a concept as personnel reserve. In this regard, there are many studies that make it possible to effectively use human potential in the labor process (Cheran, Drotter &

Noehl, 2009; Antropov, Akatov & Podbelsky, 2010; Pilnik & Guschina, 2014) to introduce innovations (Gureva at al., 2016; Usmanova & Eroshkin, 2017; Davoudi et al., 2018; Fartash et al, 2018).

A number of scientists pay special attention to the development of professional and individual competencies among management personnel, employees who display leadership skills (Bronkhorst, Steijn & Vermeeren, 2015; Kirillov et al., 2017), continuously develop emotional intelligence. As part of personnel development, problems of increasing staff motivation are explored (Karácsony, Vinichenko & Aliyev, 2018, Vinichenko et al., 2018), creating favorable conditions for performing labor functions and occupational safety of employees of organizations (Turnbull & Wass, 2015, Rogach et al., 2016, Vinichenko et al., 2016), taking care of the health of staff (Lemke & Apostolopoulos, 2015).

A special place is occupied by technology development staff. More and more practitioners are trying to introduce technologies such as gamification, time management, coaching, shadowing and others into business processes (Werbach & Hunter, 2015; Baxter, Holderness & Wood, 2016; Lumsden et al., 2016; Javier & Felix 2017).

However, a comprehensive study that revealed the nature of the development of management personnel in the overall development system of the organization's employees, its profitability, was not carried out. This has become one of the subject areas of the study.

Methodology

The study was of a systemic nature. It was aimed at achieving the goal: improving the system of development of personnel in organizations of the oil and gas sector of the economy.

To achieve the goal were identified scientific objectives:

1. Identifying the degree of employee satisfaction with their development in the organization;
2. Determining the state of the development system of management personnel.

The research methodology was a complex of general scientific and specific methods that included content analysis, included observation, online survey, expert assessments, focus group, methods of mathematical statistics, etc. The main tools were made by online survey and focus group using Likert method.

To solve the first scientific problem in the period from January 9 to December 8, 2018, a sociological survey was conducted at the territorial production enterprise of the Chamber of Commerce and Industry "Langepasneftegas" LLC "LUKOIL-WESTERN SIBERIA". The online survey method was used. The sample size was 750 people; it represents employees of the Chamber of Commerce and Industry of Langepasneftegaz at the age of 18 and older. The sample is based on quota selection of respondents. The maximum size of the error of this sample is not more than 4.5% with a confidence level of 95%. In order to achieve the required quality of research and the reliability of the results obtained, respondents were briefed on the procedure for completing the proposed questionnaires.

In order to solve the second scientific task of the study, work was done on the preparation of the scientific and methodological base, revealing the nature of the state and development of the system of scientific knowledge on the problem of improving the development system of management personnel of organizations of the oil and gas sector of the economy. Information collection and content analysis of the state of the development of management personnel was carried out over four years (2015-2018) in the Chamber of Commerce and Industry of Langepasneftegaz LLC LUKOIL-WESTERN SIBIR.

The results obtained during the sociological survey were processed by the working group, which was the subject of discussion on the focus group.

A focus group consisting of 10 experts from among domestic and foreign scientists, faculty members, representatives of business structures analyzed the results of the study. The focus of the group was the equipment that allowed to receive data from the Internet and exchange views with colleagues located in rooms located at a great distance from each other.

The main indicators for evaluating the effectiveness of the staff development system were the following: employee satisfaction with the existing development; degree of satisfaction with the existing development program; management staff satisfaction with existing development; what you need to have in an organization for development and career growth. During the field survey, the questionnaires were distributed to respondents in printed form, in the course of an online survey - in electronic form. Surveys conducted anonymously.

Results

3.1. Staff Satisfaction with Enterprise Development

In the course of the study, it was found out that at the enterprise of the Chamber of Commerce and Industry "Langepasneftegaz" the overwhelming majority of employees are "fully satisfied" with 35% or "rather satisfied" with their development 60%. It was difficult to answer 4% and "rather dissatisfied" 1%. (Figure 1).

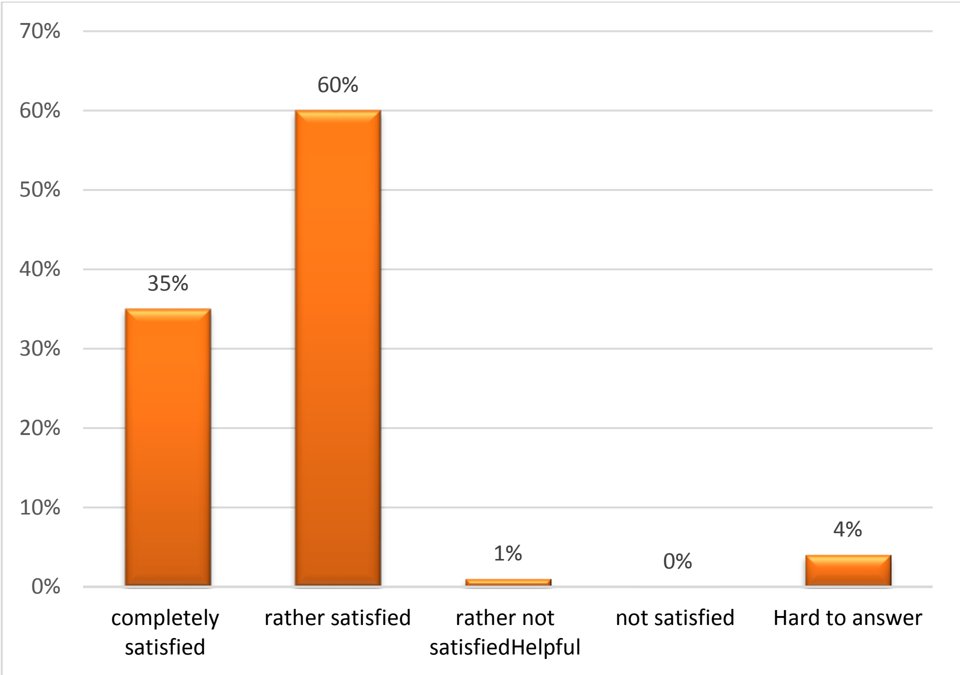

Figure 1. Employee satisfaction with existing development

Studying the opinion of respondents about the degree of satisfaction with the existing development program made it possible to establish that the training program was "satisfied" - 33% or "rather satisfied" - 46% of respondents, i.e. the main part of the respondents (Figure 2).

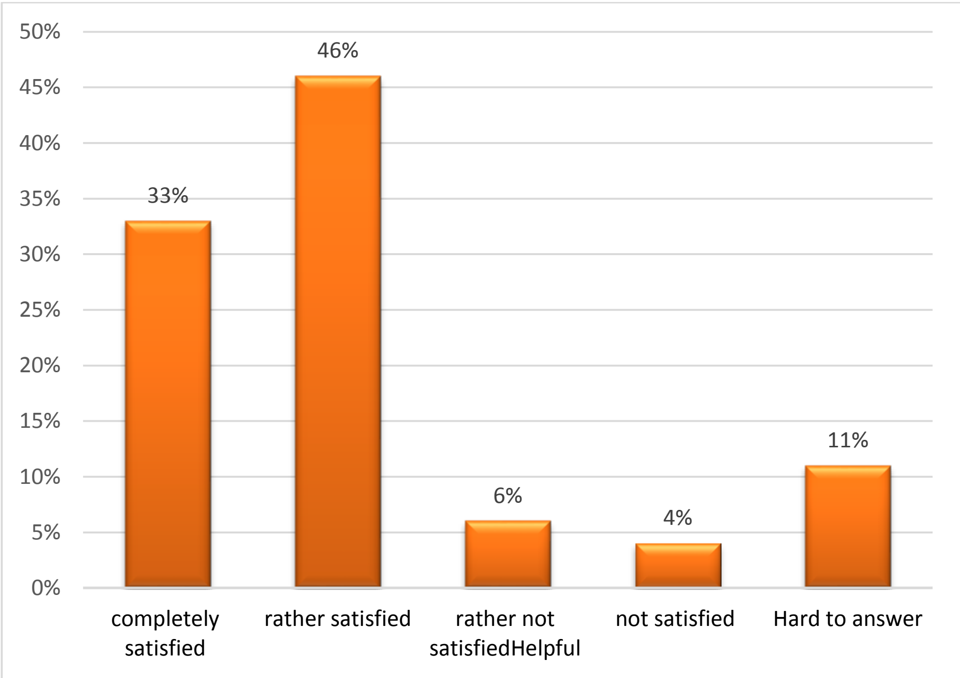

Figure 2. Satisfaction with the existing development program

In the negative sector, they turned out to be "rather dissatisfied" - 6% or "dissatisfied" - 4% is not the main part, but a certain part of the respondents that attracts attention. Difficult to answer 11% of respondents.

Respondents believe that in order to improve the efficiency of the personnel development system, it is necessary to supplement the development program with such methods as: case study — training by solving specific problem situations — 62%; internal benchmarking - comparing the performance of different departments of one organization to improve their work, studying their experience and achievements - 26%; Storytelling - distributing detailed stories about the past actions of management, employee interaction or about any events with the aim of sharing knowledge and experience - 12%.

3.2. Management Staff Development System

An analysis of the data in Figure 3 showed that the satisfaction of the management staff of the Chamber of Commerce and Industry Langepasneftegaz with the existing development differs from the opinion of ordinary employees. Among managers, "fully satisfied" 27% or "rather satisfied" with their development 42% of respondents, "rather dissatisfied" 12%, dissatisfied 2%, difficult to answer 17% (Figure 3)

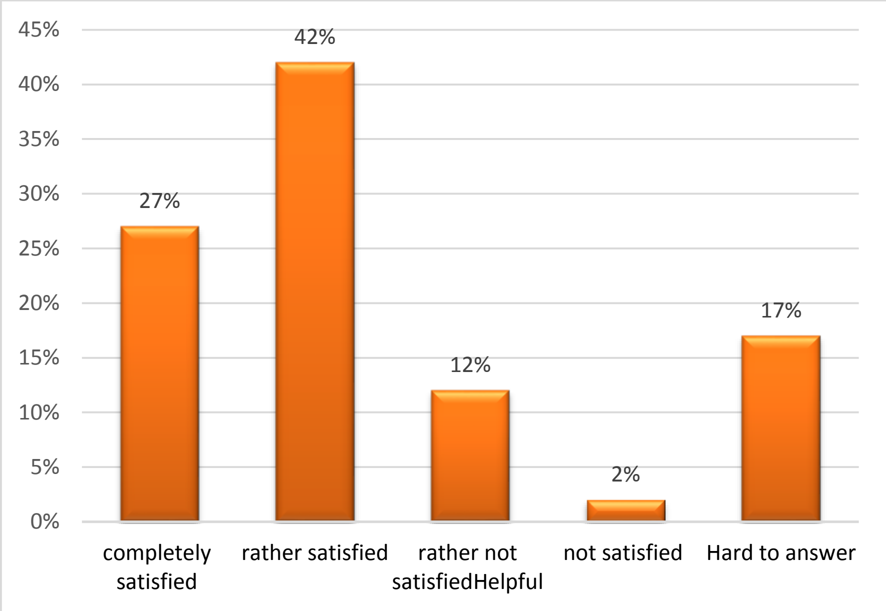

Figure 3. Satisfaction of managerial staff with existing development

The analysis of the opinion of the management personnel made it possible to establish that for development and career growth in an organization, it is necessary to have a good education - 41%, diligence in work - 24%, performance in work - 10% (Figure 4).

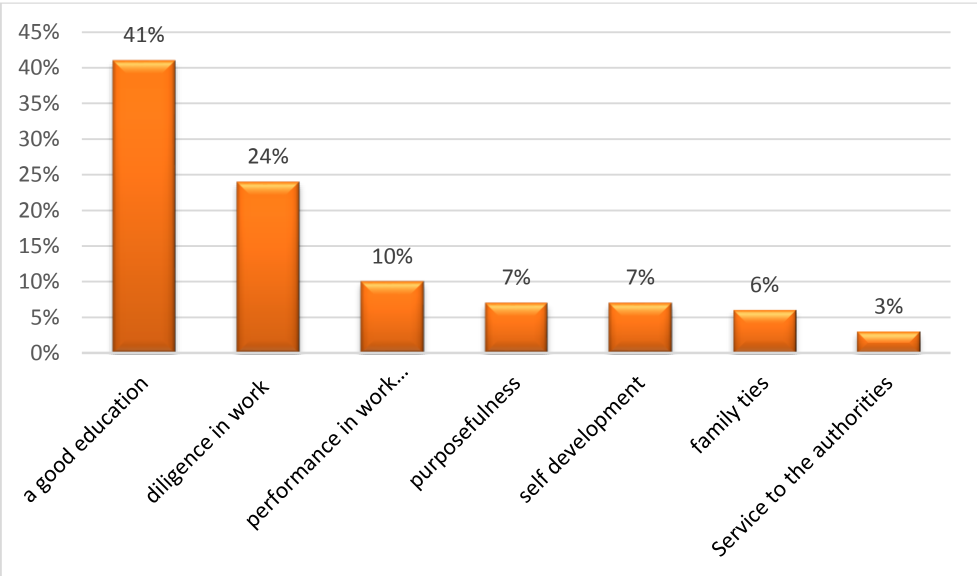

Figure 4. Results of answering the question: "What, in your opinion, is necessary to have for development and career growth?"

Approximately at the same level were single-mindedness - 7%, continuous self-development - 7% and kinship ties - 6%. The diligence of the authorities gained only 3%.

Discussion

In the course of the study, it was established that the personnel development department deals with the development of personnel in the Chamber of Commerce and Industry of Langepasneftegaz. He created a development system for all employees of the enterprise, including management personnel. It includes the organization of work on career promotion of staff, training and staff development; participation in rationalization and inventive work; staff health prevention. One of the main directions of its activity are refresher courses, the organization of in-house training for managers, professionals and employees; preparation and conduct of events that contribute to the selection and professional development of personnel (certification, rotation, internships, competitive selections, etc.); drawing up the business characteristics of employees with recommendations for the most optimal use of the professional capabilities of the individual, taking into account the prospects for their professional development; analysis of the causes of staff turnover, etc. In addition, it is entrusted with the formation of a methodological framework for conducting sociological research. This is correlated with international experience in staff development organizations (Sonnenfeld, Peiperl, & Kotter, 1992; Effron & Orth, 2014; Titarenko et al., 2017; Tsitskari et al., 2017).

HR management managed to achieve a high degree of staff satisfaction with its development at the enterprise. 95% of respondents are "fully satisfied" or "rather satisfied" with their development. The highest approval was received for contests for the title of "best by profession", the results of which set a premium for high professional skills in the amount of 15% of the tariff rate for a period of 1 year.

The complex of measures carried out makes it possible to use more and more fully the possibilities of the employees to increase labor productivity and increase production volumes. Work is underway to train and develop personnel both within the enterprise and outside the workplace, including the Gubkin RSU of Oil and Gas, the Schlumberger training center, the German production company in Germany, SolarTurbines in Belgium and other countries.

As research has shown, there is a certain unused resource in this question. In order to improve the efficiency of the personnel development system, it is necessary to supplement the development program with such methods as case study, internal benchmarking, storytelling.

There are still problem areas in the issue of development of management personnel, as evidenced by a slight increase in the turnover of this category of personnel, leading to a decrease in the profitability of investing in management training. On average, staff development spends about 1% of the annual payroll. These personnel costs are the company's investment in the development of its employees in order to increase returns and dividend growth (Belousova at al., 2016). However, the receipt of dividends from invested funds in the development of management personnel does not satisfy the management. It turned out to be lower than expected. As a result, over 3 years, 25 managers quit, whose development costs amounted to 4,095,000 rubles. 9 of them quit on their own free will after development, bringing the company losses in the form of lost profits in the amount of 14,849,640 rubles.

Analysis of the opinion of the management personnel made it possible to establish that for the development and career growth of this category in an organization it is important to improve the quality of education that they have in the first place. A positive fact is the low level of dependence in the development of managers on factors such as kinship and helpfulness to their superiors. To increase the diligence of employees and performance in work, it is necessary to improve the system of motivation and incentives, leadership styles and improve the socio-psychological climate. These activities contribute to increasing employee loyalty, increasing productivity and labor efficiency (Chulanova at al., 2018).

The focus group discussion brought the results of a sociological survey and content analysis. The experts discussed the results of the survey, revealing satisfaction with the development of employees, in particular, the management personnel of the organization, the nature of receiving dividends from the invested funds in the development of management personnel. The lack of effective development of management personnel has led to an increase in the turnover of this category of personnel. The main reasons for which managers quit were: insufficient motivation after training to stay in the company; inefficient system of selection and adaptation of personnel; poor social and psychological climate in the team, unfavorable relationships with colleagues; low probability in career growth; insufficient development of soft skills.

A focus group analysis of development costs and the effectiveness of management personnel trained has shown that the result turned out to be lower than expected, despite the fact that the productivity indicators of the employees who have undergone development have improved.

Conclusion

Sickness absence monitoring, reporting of occupational diseases and illnesses and ethical and legal issues. Increasing the competitiveness of any organization depends on the nature of changes in the quantitative and qualitative characteristics of its personnel. Positive dynamics should be provided by well-organized staff development. In the organizations of the oil and gas sector of the economy, in particular in the Siberian region, personnel development is among the priority areas in the system of strategic goals. This allows us to strive to improve the efficiency of staff development, increase their job satisfaction, loyalty. However, the system itself has some drawbacks associated with the development of management personnel. They manifest themselves through an increase in the turnover of management personnel trained in development. This leads to human and financial losses for organizations. The management of organizations is faced with the fact of the inefficiency of investing in the development of management personnel. Under current conditions, it is necessary to work more technologically with promising employees of the management cohort, focusing on the development of his soft skills. It is important to improve the personnel evaluation system in the formation of personnel reserve, to improve the socio-psychological climate in the team, motivational mechanisms, to ensure career growth. All this will increase the loyalty of management personnel, the effectiveness of its activities and reduce losses. These activities will contribute to the growth of competitiveness of organizations.

Abstract

the Information society is characterized by global communication and information interaction and the formation of virtual reality, a global information Network in which there is a communication and information interaction of many actors that are united in social networks and online network communities, which are called virtual communities The actor of communication and information interaction is the subject of the information age and is characterized as "Homo informaticus". In the information society, a specific information subculture has emerged, the carriers of which are social networks and online network communities, which, being social communication and technological phenomena, are treated as social constructs and as an expression of a new kind of sociality. These phenomena have information and ontological status and are self-governing and self-organizing social and technological communities. The system study of self-government and self-organization of online communities is connected with the study of their communication and information capital's possession.

Keywords: information society, global communication and information interaction, virtual reality, online virtual community, "Homo informaticus" as a person of the information age, information subculture, communication capital, information capital, self-government, self-organization.

Introduction

The information age is emerging today together with the Internet, which has ceased to be only a global repository of the most diverse information and a system of its transmission, transportation and redistribution, and has acquired a completely new quality, becoming a new format of information, communication, social, economic, political and daily reality. This requires understanding of its essence and various manifestations in the form of information and communication social networks and virtual network communities. The information, communication and social nature of virtual network communities or, as they are called, virtual communities, forms of their functioning, self-organization and self-government is of particular theoretical interest (Davoudi et al., 2018).

The established communication and information practices in virtual reality suggest that self-government and self-organization of virtual communities is, first, a way out of the direct action of traditional management structures on the part of state, social, political and other institutions. With self-government and self-organization is associated such a view, according to which the variety of virtual community has no vertical chain of command, which is replaced by came horizontal coordination and the traditional social status does not work.

Discussion of this problem in modern research works in this area show that the characterological features of virtual communities' self-government ae conditioned by the specifics of their virtual communication and information interaction, which in achieving the degree of development and self-sufficiency of the online community leads to the formation of new socio-technological phenomena such as communicative capital, or rather, communicative and technological capital and information capital. The acquisition of communication and information capital by the virtual community makes it self-governing and self-organizing social and information community. The study of this is the main objective of this work and expresses the systemic nature of the study of virtual community's self-government and self-organization.

Materials and Methods

To study these problems, as the main research methodological paradigm the methodology of social constructivism should be chosen (Baksansky & Kucher, 2012; Berger & Luckmann, 1995; Lectorsky, 2009; Lenk, 2009; Tokareva, 2011; Raskin, 2006). In particular, the principles of reality explication (social, consensus and media reality), understanding of the construct as a model of explaining reality, methods of institutionalization, legitimization and characteristics of the information environment are used as methodological principles of social constructivism.

To characterize information and communication in the functioning of online communities the principles of communication of N. Luhmann (1995, 2005, 2007) can be applied, from the point of view of its somereference, structural matching and selection.

As a General method of analysis the methods of structural and functional analysis should be applied, through which the structural and organizational forms of network communities and the intensity of their communication and information, personal, professional, social and civil interaction, expressing the functioning of network communities are studied.

To discuss the tasks of a specific analysis the resource and dynamic approaches are also appropriate that involve the analysis of information, personal and professional resources of network communities' actors that characterize the personal self-development of actors and their self- exhibition and self-presentation in the virtual space (Konoplitsky, 2004; Lupanov, 2001; Nazarchuk, 2011; Buch-Hansen, 2014; Tastan & Davoudi, 2015).

Additional special methods are methods of network analysis, in particular, classification of social networks, analysis of their structure as repetitive, regular patterns of relations, multi-level analysis of network groups, network subgroups, their group dynamics (Sergodeev, 2014).

Results

The results related to this work can be divided into two types, namely procedural and conceptual. The first characterize various functional and structural features of virtual communities, the second, derived from the first, characterize their system quality. Thus, the study related to the analysis of the main developments in this area, as well as the classification of social networks, the study of their matrix structure, regular patterns of communication and information relations, multi-level analysis of virtual user groups, online network subgroups, their group dynamics, shows that self-organization in virtual reality includes the following procedural characteristics:

– Autonomous existence of a virtual community, focused not on the approved order to meet the communicative and information needs of individuals, their common interests and preferences, which are one and the rallying factors;

– Voluntary nature of membership in the virtual community;

– The need for a new identity-virtual digital communication-information identity;

– Realization of the need in virtual self-presentation and self-expression

– the need to develop a new space, in particular communication and information space and its technological resources, in order to obtain new information, turn it into information knowledge and thereby contribute to the success of the process of personal self-development and self-improvement, both in virtual reality and in the traditional reality;

– the need to manifest oneself in the communication and information space by playing virtual roles (new status and new identity) in the form of cognition of a new image of oneself;

– The need to acquire communication and information competencies, which means personal, social and group, social, civil and professional development, self-development and self-improvement.

Accordingly, the result is the conclusion that the self-organization of the virtual community is an Autonomous process of coordinated within the community procedural set of individual and collective actions that lead to a system of communication and information interactions within the community and actions to communicate with other communities, social networks and traditional organizational and management structures and social institutions existing in traditional social reality.

Additional procedural results are the conclusions that in self-government and self-organization of virtual communities it is necessary to identify a number of levels that characterize their degree of development and self-sufficiency:

- internal level-adoption of rules for coordination of actions and interactions within the community: discussion and adoption of norms of behavior, the main goals, preferences and interests of the community, the rules of registration of users, values and codes that unite many users in a circle that can be called a stable group, a microsocium;
- External level - adoption of rules for coordination and interaction with other communities, social networks and traditional social institutions;
- Technical level - self-organization as a process of technical and instrumental support conditions and their change for optimal functioning of internal and external levels;
- compositional level - self-organization as a process of coordinated adoption of scenarios, models and schemes of communication and information interaction, consistent with the norms and codes of the community, with external world in relation to the virtual community;
- the technological level is the level of self-organization, which is determined by the resources of communication technologies, the choice of the software and those technologies of communication and information interaction, which ensures the most successful and effective functioning and development of the community in the global Network.

Implementation of these levels of self-organization of the virtual community, in our opinion, are sufficient conditions for its existence and functioning. The following conditions seem to be necessary:

- Voluntary entry into the community and voluntary exit from it;
- freedom of one's opinion expression and one's own assessment, fundamental equality of rights and equality of positions and assessments of members of the community, while compliance with the norms of behavior and value codes;
- self-training of members of the virtual community, as a spontaneous desire of everyone not only to express their opinion, but also to obtain the necessary knowledge, skills and abilities to justify their position through communication and information interaction;
- Self-education as a voluntary overcoming of negative and destructive motivations and actions in relation to both the inner world of the virtual community and the outside world;
- Self-control - development by the community member of virtual reflection in the form of evaluation and self-assessment of their actions and their results in the digital world;
- internal self-organization of each member of the virtual community, which, along with the self-organization of the virtual community contributes to the implementation of rational actions that implement self-learning, self-control, self-education in terms of internal criticality and focus on the optimal functioning of themselves in this virtual community and the community as a whole.

The main result is the substantiation of the thesis that the acquisition and implementation of the above-mentioned rules and conditions of self-organization and self-government of the virtual community is the acquisition of communication and information capital by the virtual community. It is natural that the whole composition of conditions and the whole set of rules represent an image of an ideal virtual world, which in reality, even virtual reality, is not always realized.

Discussion

Self-management and self-organization of virtual community is widely discussed in contemporary research literature, and in this respect, we can point out the work of a number of Russian authors whose works we largely used in the development of this theme, in particular, the work by S.V. Bondarenko (2004), M.G. Bresler (2014), A.V. Nazarchuk (2011), E.D. Nevesenko (2011), Y.G. Rykov (2015), N.A. Ryabchenko (2016) and other authors. Among the foreign researchers, we would highlight the works of N.K. Baum (2013), D. Boyd and N.B. Ellison (2007), H. Buch-Hansen (2014), L. Grossweil, M. Castells (2004), F. Probst, L. Grosswiele and R. Pfleger (2013). References to other researchers on specific issues and problems will be made in the text below.

H. Rheingold (2013) introduced the term *Virtual community* in 1993. He studied social relations in social networks, and in his book, *Virtual Community* described various forms of communication and information interaction between members of various social groups based on e-mail newsletters, news lists, multi-user communities, etc. In his opinion, virtual communities are social associations that grow out of the Network when a group of people supports an open discussion long enough and humanely to form a network of personal relationships in cyberspace.

The discussion of the nature of virtual communities shows that they have a dual nature as social constructs. This duality of social constructs is expressed in the fact that they, on the one hand, which one can call conditionally information-gnoseological point of view, are formed as a reflection in social theories of existing practices of network communication and information interaction and are summarized theoretically in the form of appropriate discourses, and on the other hand, which can be called information-ontological, are phenomena of information reality, the reality of the information world, and such a reality, which expresses a new kind of sociality – the information sociality.

The basis of the social nature of virtual communities is that they are distinguished by self-organization, voluntary nature, self-government, and cross-border nature. This is reflected in their shift on the global level beyond territorial, state, national, ideological, religious and other borders. This is also due to the fundamental lack of vertical governance on the part of social or state institutions. Many virtual communities are characterized by horizontal coordination, virtual stratification, self-organization, the fundamental absence of all sorts of power, and state, ideological, organizational and corporate centralization. Communication and information interaction of virtual communities is characterized by interactivity, independence, voluntariness, motivation by personal communicative and information interests and needs and freedom of access to information resources.

The basis of virtual community is social communication and information interaction. Being information technology product of society virtual communities spontaneously, form new network social assosiations, which consolidate the interested actors that are characterized by network thinking, the network language, network moral network ways to discuss and resolve personal and socially significant problems.

Information and communication capital are such parameters of the virtual community, discussed widely in modern research literature, in particular, in this respect, it is necessary to allocate such domestic and foreign researchers, whose works we largely rely upon: Ya.O. Biketova (2015), V.V. Dekalov (2017), Y.G. Rykov (2015), P. Candon (2016), D.K. Mumby (2016) B. Nixon (2017) and other authors (Probst, Grosswiele & Pfleger, 2013).

Information capital, which includes the necessary and sufficient formats of self-organization and the degree of development and self-sufficiency of virtual communities, specified above, also includes the following components:

– information products in the form of information acquired by the user and the virtual community, stored on tangible media, as well as information knowledge and information skills and abilities;

– Means of storage, replication and dissemination of information and material, technical and technological means of information operations and methods of information transformation;

– developed on the basis of the above mentioned information the competences in the search for new necessary information required for self-development, self-education and self-improvement and meet other information needs;

– ways and means of using information and its application for more effective and successful functioning of the virtual community and information life of each user, a member of the virtual community;

– The implementation of the above-mentioned conditions transforms information into information knowledge, which is a necessary and sufficient condition for the formation of information capital.

Communication capital, as the discussion of this concept in the modern research literature shows, is a complex, including the above-mentioned necessary and sufficient conditions of self-government and self-organization of the virtual community, as well as the levels and degrees of their development and self-sufficiency, described above (in this regard, communication capital intersects with information capital), as well as communication infrastructure, system of communication links and relations, and communication knowledge, which transforms the process nature of virtual communication into a communication culture focused on the successful and effective existence and functioning of the virtual community in its interaction with the outside world and the user within the community.

Conclusion

Self-governing and self-organizing virtual communities with the acquisition of information and communication capital influencing the traditional reality expand the social space of communication and information interaction, which is expressed in the following:

– The space of social communication is expanding, becoming more dynamic, limitless, simple and less expensive than the previous one;

– there is an unlimited expansion of possible vectors of personality development in establishing and maintaining a variety of information and communication links, in which its communication and information needs are realized and communication and information capital is acquired;

– The possibilities of various genres of virtual social communication are expanding social networks, blogs, chats, web forums, posts, comments, likes, etc.

– The creation of various organizations, voluntary associations, communities is significantly simplified;

– Network forms of organization and organizational cellular-matrix structures are distributed;

– Various types of costs for the organization of optimal communication and information interaction and exchange are reduced;

– Logistics of various social technological processes is significantly simplified;

– Various forms of financial transactions and the spread of digital finance is simplified;

– Provision of professional, educational, entertainment and other services becomes more accessible and widespread;

– The number of non-profit organizations, virtual social organizations of communities is increasing, which contributes to the development of civil society;

– Experience of interpersonal, intercultural, transnational communication in various online conferences, chats, web forums is developed.

The determination of the traditional social sphere by technosphere and InfoSphere leads to new forms of social space organization, which is reformatted depending on the communicative and technological saturation, efficiency and productivity of communication and information interaction and information value of this interaction.

Accordingly, the above-mentioned parameters of development and self-sufficiency of virtual community the system study of self-government and self-organization of virtual community is the analysis of their projection in the communication and information capital.

Abstract

The relevance of the research problem is due to the need to consider the dialectical relationship of the world of nature and world of the man in L. N. Tolstoy's works of 1850-1860-ies; to determine the direction chosen by the writer in the study of the complex relationship between micro - and macrouniverse; to reveal the regularities of the process of ethical philosophical and aesthetic understanding of the world by early L. N. Tolstoy. The purpose of the article is to derive the formula of the existential dialectics of L. N. Tolstoy, to differentiate the concepts of cultural / natural and intelligent / instinctive. The leading approach to the study of this problem is a comprehensive one that combines elements of hermeneutic, comparative, narrative and biographical methods. The article proves that L. N. Tolstoy in definite periods of his life interpreted differently the concepts of "nature" and "man". In 1850-1860-ies, he perceived «natural» as a synonym of vital, natural and absolute. Such a diverse semantics is explained, on the one hand, by the fact that nature is an objective world that exists independently of human consciousness; on the other hand, it is a fundamental property of nature, what is originally inherent in a man: the nature of character, the nature of the artistic image, the nature of a man. The world created by L. N. Tolstoy in his novel, is real, because it is based on the formula of existential dialectics: being adjoins to being. All phenomena, processes, objects of reality are considered by the writer according to the scheme: reality (being of essence) – existence (connection of things) – essence (sense of things). Relationship with "macrocosm", according to L. N. Tolstoy, colours a lonely man's stay in the world, lonely because a person is endowed with a pronounced personality that does not allow him to feel a link in the overall chain. Even that L. N. Tolstoy's character, who feels involved in the micro-process, cannot dissolve in it, since he is subject to the laws not only of the general, but also of individual existence. Exploring human nature, L. N. Tolstoy notes that the main cause of the misfortune of his characters is a conflict of cultural and natural, rational and instinctive principles. Emphasizing the complexity and richness of nature, the writer avoids direct and categorical judgments, differently assessing the "natural" in a man. On the one hand, instinct is the guarantor of life, as it allows you to adapt to its conditions, to survive, to find your place, to defend it. On the other hand, instinct is perceived as something secondary to the mind, a more primitive beginning. L. N. Tolstoy in 1850-1860-ies considered those characters being harmonious, viable and integral who combine the biological non-conflict with the spiritual one. The materials of the article are of practical value in the practice of University teaching for the development of training courses in Russian literature of the XIX century; in the development of training and teaching tutorials; in lexicographical practice for the compilation of a new type of dictionary – L. N. Tolstoy's idioglossary.

Keywords: L.N. Tolstoy,War and Peace, a man, nature, the philosophy of being.

Introduction

A human being, according to L. N. Tolstoy, contains a part of the "Entity", and under the latter the writer understands the world in the broad sense of the word, the world through " decimal I" (Bilinkis, 1986). The world, the Entity, nature, natura – this is a synonymous series in the perception of the writer. However, L. N. Tolstoy considers that the ultimate goal of nature is a man. "What am I?"- the writer asks himself, as if he is interested in the way the nature "became a man" (Tolstoy, 1984). Consequently, the problem of the relationship between a human being and nature can be represented in two aspects: a man in nature and nature in a man.

The first aspect determines the place of the man in the world, the influence of nature both on him and on the system of his aesthetic and moral philosophical views. Researchers of L. N. Tolstoy's creativity, reflecting on the variety of dialectical connections between the individual and the Entity in the artistic universe of the writer, adhere to the author's formula, derived in "Dnevnik" in 1857: "I love nature, when it surrounds me and then stretches across the whole horizon, but when I am in it... when you are not alone rejoice and enjoy the nature" (Tolstoy, 1984).

Thus, L. N. Tolstoy tried in his diary notes to reveal the essence of his own method, which had already defined well in his first works by that time. His world is "I" and "not me", the latter includes not only the objectively existing reality in its diverse forms (Gromov, 1997; Fortunatov, 1983), but other people (Slivitskaya, 1988; Saburov, 2009). L. N. Tolstoy represents life through the eyes of the artist, and his goal as an artist is to display reality so that "to pour into another his view at the sight of nature" (Tolstoy, 1984).

As for the second aspect, the phrase "human nature" is the most frequently used in literary studies. So, V.D. Dneprov (2011) expands the meaning of this definition, including all the aspects that form a particular human type: for example, the type of the Rostovs, the type of the Bolkonskys, the type of the Kuragins, whereby it is possible to speak about the nature of Natasha, Knyaz Andrei, Anatole (Dneprov, 2011). However, in the strict sense, human nature-is primarily the "wealth" of its" biological manifestations", the world of sensations and instincts. Prima facie such restriction of the meaning constrains the capabilities of the researcher, predetermines a kind of schematism in the study of a complex issue. However, at the same time, if one of the tasks is to identify the actual "natural" in L. N. Tolstoy's characters, it is reasonable to use the combination of "human nature" in its second meaning, because this aspect is insufficiently studied.

Methodological Framework

The study is based on an integrated approach that combines elements of hermeneutic, comparative, narrative and biographical methods.

The hermeneutic method, which presupposes the scientific interpretation of subjectively colored author's statements, gives the possibility to comprehend the numerous meanings of the problem of interaction between a man and nature, taking into account the objective assessment of the time of creating an art work, the influence of traditions and cultural context. Comparative method makes it possible to consider the laws and principles of L. N. Tolstoy's literary texts structuring, as well as their communicative essence, invariant in the structure and semantics of different texts. The narrative method allows us to consider a work of art as a result of aesthetic communication between the narrator (narrator) and the recipient (reader), which reveals the underlying structures of the work. Biographical method based on the study of the writer's life, analysis of autobiography, research of diaries, notebooks, allows studying the evolution of L. N. Tolstoy's views on the problem of the relationship between a man and nature. This method provides an opportunity to understand the work of the Russian classicist better, because throughout his life he had been keeping a diary.

Results and Discussions

Pondering the problem of the interaction of a man and nature, and highlighting the genesis as an artistic and philosophical category in L.N. Tolstoy's creativity of 1860s, it is necessary to consider, firstly, the fact that the writer was not far removed from philosophy, even in his younger years; secondly, the relationship between a man and nature in this author's works reveals L. N. Tolstoy's special opinion on being human, which is a kind of original Tolstoy an ontology and anthropology. And finally, some natural images (for example, astral images in the "War and Peace"), as well as landscapes in general, are so independent, self-valuable that they serve as a necessary material in the study of the features of Tolstoy's worldview (Lomunov, 2010).

In L.N. Tolstoy's works natura naturans (creating nature) is an active creative subject: creative, because creating, but at the same time devoid of reason. L.N. Tolstoy believes consciousness to be absolute value in a man (compare: the late L.N. Tolstoy's "reasonable consciousness"), pure and unchanged, making it possible to perceive phenomena in their unity and connectivity. The more intelligent a person is, the more artificial he is. Confirmation is in the image of the intellectual Knyaz Andrei: the Rostovs are clearer, simpler; Knyaz Andrei is more perfect and difficult.

L.N. Tolstoy's attitude to nature is close to the pagan worldview. E.B. Taylor (1987), an English anthropologist, characterizes the peculiarity of pagan consciousness: "... a person sees the smallest details of the world around him as manifestations of his personal life and will" (Taylor, 1987). Indeed, the oak in Knyaz Andrei's perception is not that other, as a manifestation of personal life and will: the character denies himself the pleasure to live and enjoy life and sees a dying oak, then comes to life and rejoices the tree covered with foliage. Nikolai Rostov notices a tree, as it seems to him, on the borderline between life and death, but, having crossed this line, he does not die. M.M. Bakhtin's (2000) typical remark: "His [Tolstoy's] God is more reminiscent of the pagan Pan... than the Christian God: good thing that it does not come from me, not "I" (Bakhtin, 2000).

The perception of nature as an active creative subject, its humanization brings L.N. Tolstoy with the old Russian tradition. As well as in "The Lay of Igor's Warfare", on the pages of "War and Peace" the response of nature to events in human life attracts readers' attention. Tolstoy borrows from old Russian works the method of comparison: comparing the world of man with the world of nature, the writer achieves the clarity that allows the reader to understand accurately the author's idea without any additional comments. Moreover, each character close to Tolstoy, somehow is involved in his dialogue with nature. This dialogue allows us to distinguish the category of being as an artistic and philosophical one in Tolstoy's works, because being for the writer is primarily an artistic universe in which the movement of human feelings are closely related to natural changes, but at the same time in this plexus of human and natural Tolstoy's complex philosophical views on the world and a man are reflected.

The writer's views are changeable. Tolstoy could prove the idea he liked once in his social and political essays, literary creativity and correspondence but soon for reasons known to only his genius, suddenly abandon it and say something opposite. V.I. Ivanov (2009), correlating L.N. Tolstoy with Russian culture of XIX-early XX centuries, noticed this fundamental feature, especially clearly manifested in the late work: "Truly above all he wanted... emancipation... in the form of... exposure, revelation, simplification. From the power of the word itself, this artist of the word was steadily liberated, as he sought independence from psychology, this clairvoyant of the human soul and the natural soul... and therefore internally antinomic, being himself an anti-artistic force. For that is the work of the artistic genius to reveal the noumenal in the vestment of the phenomenon..." (Ivanov, 2009).

L.N. Tolstoy, at the beginning of his life was fond of Zh.-Zh. Rousseau (at the age of 16 the writer was wearing a medallion with a portrait of Zh. Rousseau instead of the cross on the neck), and in the second half of the creative way he worked on a rational resolution of the "problem of life", ignoring "natural movements"; struggling with Orthodoxy and so much taken from it in his teaching "non-resistance to evil with violence»; who loved music, but in the 1890s wrote a meticulously unjust book against art, in his own way synthesized in his work elements of various philosophical doctrines, starting with Slavophilism of the first half of the XIX century and ending with the positivism of the end of this century (Maymin, 1978). As Tolstoy himself declared, in the early period of his activity, he had no deep knowledge of philosophy, but had a general idea of the history of European philosophical thought. As an extraordinary person, L. N. Tolstoy preferred to appeal to philosophers in search of confirmation of his own theories and assumptions. In the correspondence, in Tolstoy's diary somehow the names of philosophers who at one time or another awakened the imagination of the Russian thinker are mentioned. What became apparent in the 1910s was a latent period in the 1860s, when "War and Peace" had been written. Drawing parallels between Tolstoy's views and other philosophers, it should be remembered that they are conditional, since the writer himself discovered the proximity of his views with the ideas of Western European philosophers after he had created his novel.

For early L.N. Tolstoy Rousseauism became crucial. Following the French enlightener Lev Nikolaevich throughout all his creativity of 1850-1860-ies proves that harmony between a person and the outside world is possible only in the "natural state". From this point of view the following images should be examined: Daddy Eroshka ("Cossacks"), the Rostovs ("War and Peace"), Nikolenka Irtenev ("Youth"). Considering L.N. Tolstoy's works till 1869, it is possible to reveal a synthesis of the spiritual and the material. It is that allowed N.G. Chernyshevsky (1989) to speak about "dialectics" as one of the features of L. N. Tolstoy's literary style. The writer consistently implemented in his works, all three dialectical principles: the principle of universal interrelation, variability and contradictoriness of existence, hence the "changing state", not only emotional (psychic), but material (physical) as well. If thirty-year-old L.N. Tolstoy would be asked one of the main questions of philosophy: "What is primary: matter or spirit?"— he is likely to join to the dualists, like J.-J. Rousseau.

Indeed, L.N. Tolstoy's world of objects, phenomena, processes is in close relationship with the world of mental movements. What is the cause and what is the consequence, L. N. Tolstoy does not determine, because he sees no criteria for such a division. On the contrary, an imaginary Eden is being gradually formed for the reader, harmonious and self-sufficient. The inhabitants of this Paradise – the Rostovs (except Vera), Nikolenka Irtenev, Maryanka, Lukachka, Daddy Eroshka. At the gates of Eden – the Bolkonskys, destroyed the harmony of physical and spiritual, therefore deprived of happiness; Olenin. The characters are not allowed to enter Paradise are Sonia, the Kuragins, the Drubetskoys, the Karagins and Napoleon.

Tolstoy's dualism is special – artistic. The equality of material and spiritual principles immediately attracts attention: the Rostovs are impulsive, have a developed intuition, open to peace and happiness because the environment that brought them up is pleasant, bordered by forests and picturesque nature. At the same time the pictures of nature selected by L.N. Tolstoy specifically as a living environment for the Rostovs, because this type was conceived as the embodiment of nature.

Knyaz Andrei lives in a "bogucharovskaya abode," in "ugly, flat landscape" (Tolstoy, 1980); otradnenskiy paradise is unknown to him. Surrounding is in full accordance with his condition. A year later, in the spring of 1809, Knyaz Andrei goes to the Ryazan estate of his son. The area is the same, but it is perceived differently: green birch forest, pleasing to the eye. Here same is hard not to recall Pierre. The trip is connected with Pierre, here was the conversation in which Pierre demonstrated the necessity of integration into the Entity.

L.N. Tolstoy's genesis is objective and invariable. Only man's views of the world, their place in it in different moments of life change. In the surrounding world our view highlights what is desired, the reason for that is "dialectics of the soul" and "the secret movement of mental life" (Chernyshevsky, 1989). In the literary space of Tolstoy's works, genesis exists independently of human consciousness, but each of the characters sees his own world, creates his own idea of it. It is A. Schopenhauer's (2012) idea, whom L.N. Tolstoy called "the most brilliant of people" in his letter to A.A. Fet of 1869 (Tolstoy, 1978): "the world is my idea" (Schopenhauer, 2012). Unlike the German philosopher, L.N. Tolstoy is not an idealist; the writer's material and spiritual existence is genuine both, it is two-fold: the world outside me (objective) and the world inside me (subjective).

Tolstoy's search is independent. All the characters of "War and Peace" empirically discover the world around; the essence of "phenomena" is available to them. Those characters, who try to put the idea of the world in the Procrustean bed of rationalism, just get confused in contradictions. A striking example is Knyaz Andrei. But late L. N. Tolstoy, who created the doctrine of" intelligent consciousness", could not rationally explain everything, leaving the concept of the divine as something unknowable. The noumenon in the Kantian sense turns out to be unknowable for a man, since the latter may suffer the world sensuously. No matter how hard Peter Rostov tried to get an idea of where the "music of spheres" came from, it remained inaccessible to his understanding. Having a developed natural origin, the character just enjoyed this music and "game of stars".

Being in the literary space of "War and Peace", on the one hand, is an absolute value (eternal sky with clouds floating on it; change of seasons). All these things exist independently of human consciousness. The oak is covered with foliage not because Knyaz Andrei gradually comes back to life, but because it is a decree of nature. On the other hand, existence is relative, because, in the words of A. Schopenhauer (2012), "exists only through another, and for another". Tolstoy's man is "not just" an abstract object of pure knowledge", but a part of this world, physically integrated in it: Know Thyself – first of all, I am bodily, willing and acting, seeking and suffering, in addition manifesting (at the same time) as the will... objective reality (will) coincides with the subjective reality (body)" (Schopenhauer, 2012).

The concepts of the world and man are linked together. A kind of cosmic beginning, which is based on love, is the absolute for Tolstoy. The writer believed that it is necessary to come to love consciously and reasonably. This is confirmed by Knyaz Andrei's reflections after a mortal wound in 1812 or Pierre's reasoning in captivity. L.N. Tolstoy in the first case writes: "Yes, the love that God preached on earth... and which I did not understand, that's why I felt sorry for life, that's what still remained to me..." (Tolstoy, 1981). In the second: "They hold me captive. Who me? Me? Me - my immortal soul" (Tolstoy, 1981). "Every thing in nature" by L.N. Tolstoy is unknowable to the end because of the poorly developed human "ratio", indeed for knowledge you need "rational intuition". For L. N. Tolstoy absolute is transcendent because of its superessence. The writer's divine cosmic principle is supra-natural, orderly, and nature, as one of the components of being, is blind and chaotic. Tolstoy's ontology is close to the dualism of J.-J. Rousseau. The Russian philosopher recognizes the duality of human nature (spiritual and biological principles), and as a consequence – the duality of being (universal and individual). Finally, in the diary of late Tolstoy there is a record: "It is amazing the way we are used to the illusion of our features, separation from the world. But when you understand this illusion, you wonder how you cannot see that we are not part of the Entity, but only a temporary and spatial manifestation of something timeless and non-spatial" (Tolstoy, 1985). Whether a person is "part of the Entity", he would have been solid, according to L.N. Tolstoy, devoid of contradictions, which result from the antithesis: "the temporary manifestation of something non-temporary". In this diary entry, the writer identifies the Entity with the divine, but earlier L. N. Tolstoy's Entity used to be first a harmonious world of nature and from this point of view, a person could be a part of it.

L.N. Tolstoy as the twofold unity of the natural and the spiritual, exactly the twofold, and not the identity perceives both the world and the man. The man and the world, according to L.N. Tolstoy is being, which has its "past", that is becoming, and its "future", that is development. This is the essence of existential dialectics: the being is opposed to not-being. However, the writer has no unbeing, just as there is no otherness. Late L.N. Tolstoy would come to the idea of "eternal life in a man" (not a man, but in a man): "What he learns is one everywhere and in everything and in himself… this is God, and that part of God, which is our real "I" (Tolstoy, 1985). That is, a person from this point of view, indeed, is "a manifestation of something timeless and non-spatial", because his consciousness (and this is part of a person, deprived, according to the late L. N. Tolstoy, individuality) is attached to a certain Entity.

L.N. Tolstoy in the 1860s was still far from such conclusions, the unity of spirit and flesh – that is what the writer saw as the key to life, and the destruction of one of the components leads to death. That is why death was so dire for his great mind, represented absolute nothing. Dying, Knyaz Andrei experienced a state of "awakening from life." Tolstoy notes that Knyaz Andrei being still physically alive "was no longer, he left them," and Knyazhna Mar'ya and Natasha looked after "for the closest memory of him – for his body" (Tolstoy, 1981). Awakening is the beginning of something, but why "awakening"? It means that something tormented L. N. Tolstoy, did not allow him to accept the idea of absolute destruction, destruction of the soul. The idea of death became the idea of leaving. On the proper B. S. Meylakh's remark, L. N. Tolstoy feared and hated death, "though had been trying for years to convince himself that it was blessing" (Meylakh, 1979). The writer really denied the possibility of any other existence, except the earthly one, but in 1905, he says: "... it won't be useful for me in the world beyond" (B. S. Meylakh, 1979). Still, this "orchestra", in which "not all pipes play in unison", as M. Gorky defined L. N. Tolstoy, believed in the immortality of spiritual life: "God is my will", "... believe in Him – and he is," wrote L. N. Tolstoy in his diary on November 23, 1909 (Tolstoy, 1985). In his later work, "awakening" would be replaced by "liberation". The semantic paradigm of this word was precisely built by Ivan Bunin, while creating the book "The Liberation of Tolstoy»:

«Osvobozhdenie (spasenie, izbavlenie) ot smerti najdeno!

Osvobozhdenie v razoblachenii dukha ot ego material'nogo odeyaniya.

Osvobozhdenie – v samootrechenii.

Osvobozhdenie – v uglublenii dukha v edinoe istinnoe bytie …» (Bunin, 1967).

Obviously, paradoxes are inevitable. How can you call being the actual nothingness? However, L.N. Tolstoy could not call nothingness what he did not know, sphere of what was unavailable to knowledge. The writer has being (material) and being (spiritual), and the spiritual is more essential than the material. In this case, L.N. Tolstoy does not contradict his dialectics, since the existence is the "connection of things, phenomena in their interaction" (Feuer, 2012).

This Eleatic formula of being – "I – am", "everything-is" exists only in the present time. Let us draw a parallel with Parmenides, which will help to deduce the formula of L.N. Tolstoy's existential dialectics. Appeal to classical Greek philosophy is not accidental, it is known that the writer appreciated the ancient thought for its aphorism and conciseness, wrote down in a special notebook sayings of Greek thinkers. The philosopher eleat says: "everything is continuous: for things are adjacent to things" (Motroshilova, 2013). "The being adjoins to the being" - that is L. N. Tolstoy's formula. Death is replaced by birth. This is the real existential dialectic. The death of Knyazhna Lisa is accompanied by the birth of Nikolenka ("War and Peace"); Kitty is taking care of the dying of tuberculosis Nikolai Levin and learns about her pregnancy ("Anna Karenina"). In 1813 Graf Ilya Andreevich Rostov died, but a month earlier Natasha married Pierre. Moreover, even Peter Rostov's death is compensated with Pierre's liberation. The continuity is obvious: in the epilogue of "War and Peace" grown-up Nikolenka lives up to his father's ideals – Knyaz Andrei; little Natasha, the daughter of Knyazhna Mar'ya and Nikolai Rostov, is similar to the once "thin", "black-eyed" Natasha, who is now a mother of four children.

So, in the novel "War and Peace" the man and the world are shown in a direct relationship. Both concepts are the essence of cause and consequence that gives you the opportunity to talk about existential dialectic.

L.N. Tolstoy of the 1860s is interested in the idea that constant work on "natural" inclinations should be carried out in the name of those spiritual tasks that are opened only to the inner person. It is necessary to refund "integrity in the spirit" to a man (Kireevsky & Kireevsky, 2006) by the reunification of faith and reason, which are separated by sin. Human happiness is possible only under the condition of harmony with the surrounding world (Abramzon, 2015). Confirmation can be found in the following: Knyaz Andrei is punished for excessive rationality, skepticism deprives him of faith, giving hope and strength, he has no "integrity in the spirit." Intellectual principle takes Knyaz Andrei in the sphere of speculative conclusions, far from the "living life".

The Rostovs, except Vera, are bestowed on "integrity in the spirit." Faith and reason are balanced in them. This noble family is represented in a temporary trinity: the past (Graf Ilya Andreevich and his wife Natalia Rostova), the present (Nicholai, Natasha, Peter) and the future (Natasha's four children and three of Nicholai). They will remain "the last of the Mohicans" after the tumultuous events of 1805-1812. They will lose their fortune, their estate, but not their kin. In their integrity – new life potency, the key to the continuation of the human race.

Pierre Bezukhov plays a particular role: both reason and feeling help the character to discover the world. In the epilogue we meet Pierre, who harmoniously combines the rational and the emotional. The character was constantly torn between the two principles: carried away by Freemasonry, he consciously tried to improve the world and himself; guided by the senses, Pierre found himself in the trenches with the soldiers in the midst of the battle of Borodino and later saved a child from fire and was captured. But that was where Pierre finds the formula of human happiness, regains "integrity in spirit":" the absence of suffering, satisfaction of needs and consequently the freedom of occupation choice, that is, the way of life, now seemed undoubted to Pierre and the highest happiness of the man " (Tolstoy, 1981).

Thus, talking about some integral L.N. Tolstoy's philosophical system of 1860s is improperly, however, taking into consideration the scale of his epic and be aware from his letters, memoirs, diaries of the movement of the author's thought, we can draw the following conclusion: Tolstoy's perception of the world is syncretically connected with the understanding of the man and his place in this world. At the same time, the uniqueness of the young writer's experience lies in the ability to comprehend the phenomena of reality artistically and philosophically at the same time.

Natural and human worlds by L.N. Tolstoy exist autonomously, independently from each other, the rhythm of their development is also different, but the life of one without the other is unthinkable. Natural Philosophy by L.N. Tolstoy becomes an integral part of his anthropology. The world of nature is shown through the eyes of various heroes, it is spiritualized as much as each character and the author himself endows it with life.

In his artistic research L. N. Tolstoy sought to comprehend the diversity of the relationship between man and nature. In the works of early L.N. Tolstoy existential dialectics can be represented in this form:

Being (objective world outside of consciousness)

⇓

Actuality (being of essential and non-essential)

⇓

Reality (being of essential)

⇓

Existence (the relationship of things)

⇓

Essence (the meaning of things)

From the objectivity of the real world L. N. Tolstoy gradually came to comprehending the essence, the meaning of the material world. The path of knowledge often passed through the identification of dialectical connections (existence). Thus, the death of Knyaz Andrei - is a gradual, perceived by the mind break of everyday ties. In addition, almost all the deaths in the novel are accompanied by the birth of a new life, that is, everything "exists only through another and for another" (Rudakova & Regéczi, 2018). Being replaces non-being, and vice versa. According to L. N. Tolstoy, there is a mystery of the world in the patterns of this movement.

In some periods of his life L. N. Tolstoy put different values in the concepts of "nature" and "man". In the 1850s-1860s "natural" was perceived by him as a synonym for "life", "inartificial", "absolute". Such a diverse semantics is explained, on the one hand, by the fact that nature is an objective world that exists independently of human consciousness; on the other hand, it is a fundamental property of nature, something that is originally inherent in man: the nature of character, the nature of the artistic image, the nature of man.

The relationship with "macrocosm", according to the opinion of L.N. Tolstoy, colours lonely stay of the man in the world, lonely because a person is endowed with a pronounced personality that does not allow him to feel like a "point on the streamline" (Gershenzon, 2009), a link of a common chain. Even that hero of L. N. Tolstoy, who feels involved in the "world process", cannot blend in with it, since he’s been subjected to the laws of not only general, but also individual being.

The writer, trying to understand the secrets of the universe, came to the fact that within the boundaries of the literary work he created his own universe, a kind of peculiar model of "micro - and macrocosm". From this point of view, it is legitimately to call L.N. Tolstoy the demiurge. Populating his universe with heroes, the author kept a close watch on the fact, what law determined their development. L.N. Tolstoy is an extrovert, he is focused on the world and man. Therefore with such curiosity he observes what happens on the pages of his own novel. The writer discovers that objective changes are predetermined by the will of the author and the logic of the novel's action, while a series of subjective movements is determined by the law of individual being, which does not obey the creator. Thus, the general being predetermines the individual, but does not subordinate it to itself. The heroes of L.N. Tolstoy are independent and free to choose the path of their development.

Exploring the human nature, L.N. Tolstoy notes that the main cause of his characters’ misfortune is a conflict of cultural and natural, rational and instinctive principles. Emphasizing the complexity and wealth of nature, the writer avoids direct and categorical judgments, evaluating the "natural" in man in different ways. On the one hand, instinct is the guarantor of life, as it allows you to adapt to its conditions, to survive, to find your place, to defend it. On the other hand, instinct is perceived as something secondary to the mind, a more primitive principle. In the 1850s – 1860s L.N. Tolstoy considered as harmonious, viable and complete those heroes in whom the biological is balanced with the spiritual, non-conflict with him. These are in the final of "War and peace" Pierre, Natasha, Nikolai. In the same row may only partly find a place for herself

Knyazhna Mar'ya, because this heroine, though she has become Rostov, still remains loyal to the Bolkonsky-family, whose natural behavior is subject to spiritual values. The ideal hero of L. N. Tolstoy - Knyaz Andrei - turns out to be unviable, he died, his instinct did not save him.

In the heroes alien to the writer the "base nature" appears, their actions are determined by the "animal" principle. Thus, the behavior of Anatole, fawning over each skirt by the call of nature or for convenience, resembles the behavior of a male. Otherwise the "animal" appears in Dolokhov. This hero is a hunter, his whole life is an attempt to assert himself, to prove his own strength: he despises the weak, pursues the strong. Helen is an example of "dead nature", she is even devoid of sensuality.

The way to the knowledge of natural and human being in the works by L.N. Tolstoy goes through the perception of the world by the writer's favorite characters. The writer together with the characters comprehended the world, multiplied, felt differently, but as a result synthesized inside his mind this "worldview", "world perception".

Conclusion

The process of understanding the relationship between man and nature in the works by L.N. Tolstoy of the 1850s-1860s went in two directions.

First, the writer understood the "natural" in two ways. On the one hand, it is the world of the elements surrounding man, on the other – human nature, and for L.N. Tolstoy "natural" is not equivalent to "idealized". In the writer's perception nature is harmony, which, in its turn, lies in the balance of good and evil, eternal and momentary, necessary and useless, etc. That is why nature is both a creative and destructive principle, while maintaining eternal balance. This way it appears on the pages of the novel "War and Peace".

Second, exploring the world of nature, L.N. Tolstoy always comes to the man. The main method of the writer is an art deduction. According to the conviction of L.N. Tolstoy, one cannot consider the man metaphysically, only revealing his diverse and complex connections with the outside world will finally help to know the truth about the man, to explain all that inexplicable that is hidden in the depths of this "miniature universe".

Recommendations

The practical significance of the undertaken research means that the obtained results can be used in the practice of university teaching for the development of training courses in Russian literature of the XIX century; in the development of educational and teaching aids; in lexicographical practice for compiling a dictionary of a new type - idioglossary of L. N. Tolstoy.

Abstract

The paper studies the manifestations of conflict in primary school age as an inevitable aspect of the complex of social and psychological factors of a modern society. We reveal the psychological features of the conflict behavior and the psychological and pedagogical conditions of support to these conflict manifestations. Moreover, we claim psychological and pedagogical support to be an integral part of the educational process of primary school children in conflict situations. Our results show that psychological conflicts between the children are caused by both (i) emotional and volitional disorders, and by (ii) the insufficient formation of communication skills.

Keywords: conflict,primary school,psychological and pedagogical support, cooperation.

Introduction

The need to study conflicts between children is caused by the essential problems in our everyday life. The growth of conflict at school reflects one of the most acute social problems of our society, where in recent years the use of physical and emotional negative effects have increased dramatically. In particular, the increase of aggression against a person leads to serious consequences for all parties involved in the conflict.

There is enough experience in the field of conflictology in russian pedagogics. The process of junior schoolchildren conflict investigation is complex and based on the grounds of the investigations dedicated to conflict theory (Ancupov & Shipilov, 2013; Ancupov & Shipilov, 2004; Grishina, 2000; Anan'ev, 2001; Dmitriev, 2002; Tastan et al., 2018); the theory of children's personal enhancement (Bodalev, 2015; Bojovich, 2001; Vorob'eva & Shakhmatova, 2006); the investigations of junior school children's emotional-volitional sphere (Polyakova & Mamedova, 2016; Sorokoumova, 2018). Conflict relations in the educational process are studied by A.S. Belkin (1995), N.I. Leonov (2006), A.I. Sorokina (2001) and etc. The advances studies of pedagogical conflicts (Ershov, 1992; Kurochkina & Shakhmatova, 2013; Rybakova, 1991). determine the features of conflicts in education and its significance for pedagogical process. It the scientific works of L.S. Vygotsky (2007), A.G. Zdravomyslov (2005), J.L. Kolominsky & B.P. Zhiznevsky (2001) and etc. the authors indentify the reason for appearance of a conflict as well as determine the strategies to overcome it, discover content of the activities, dedicated to prevention and removal of the consequences which are connected with conflict relations.

Conflict as a psychological and pedagogical phenomenon and as an integral part of personality and society has been studied by many psychologists and educators (Tastan & Davoudi, 2013). Recent work (Mosina, 2018; Pavlenko, 2000) emphasizes the need to create conditions for the personality-oriented interactions between children of primary school age, since it is the interactions that are often accompanied by conflicts that arise. Such conflicts negatively affect both the children involved in the conflict and the class, reducing the productivity of children’s interactions with each other and the level of children’s activity in the learning process.

To summarize, the relevance of the study lies, on the one hand, in the importance of studying conflict manifestations in the early school years and in the psychological and pedagogical support of children's conflicts, and on the other hand, in the small number of experimental developments in the field of research on these issues.

Research Methodology

The purpose of the investigation: to propose, justify and approve productive forms of work on the prevention and correction of conflicts between primary school children.

Research objectives:

1. To formulate the theoretical foundations of conflicts between primary school children in the context of pedagogical science.
2. To consider the causes and characteristics of conflicts in primary school age in the context of the psychological and pedagogical characteristics of primary school children.
3. To devise the organizational and pedagogical conditions of psychological support for conflicts between primary school children.
4. To propose, justify and test experimentally the effectiveness of work on the prevention and correction of conflicts between primary school children based on the diagnosis of their conflict manifestations.
5. To suggest methodological recommendations for prevention of psychological conflicts between primary school children.

Conflicts in primary school age play not only a negative role but also serve as a basis for building relations with other people in the future.

The main reasons for these conflicts are (i) the children’s inability to communicate effectively, and (ii) the personal characteristics of the children themselves.

In the early school years, interactions between children move from chaotic interactions to managed interactions built on joint activities. These activities help to establish certain norms and rules that primary school children use to get out of conflict situations. Such rules are presented in a form developed by the children themselves in the process of interaction. Therefore, the success of prevention and correction of the conflict depends on teaching children to control their actions, to find optimal ways out of conflict situations, to forecast the consequences of their actions and so forth, which, in turn, requires psychological and pedagogical support.

In order to successfully prevent and correct, if necessary, conflicts between primary school children, it is necessary to determine the psychological and pedagogical conditions accompanying such conflicts. These conditions include:

– maintaining a positive socio-psychological climate in the study group;

– consideration of the personal characteristics of each child; building cooperative relationship between the teacher and each child; using methods that help children to become more active in the learning process;

– the readiness of a child to resolve a conflict; the responsibility of a child for his/her behavior; «Regarding the primary school age, we understand responsibility as an integrative characteristic that determines the behavior in educational and other activities based on the social norms of learning motives and a positive emotional attitude to it» (Sorokoumova, Molostova & Ferapontova, 2017).

– using active forms of work, such as conversations, discussions, games, contests, thematic class hours, intellectual, aesthetic and cultural activities;

– teaching communication skills, methods of self-regulation, etc.;

– using by the teacher the principle of “the relationship of pedagogical management and children's self-management, which involves creation of situations that require collective decision making, forming a sense of responsibility for their action, protecting each member of the team from negative reactions and manifestations” (Kurnosova, 2018).

In general, the content and methods of work to prevent and correct the negative effects of psychological conflicts are determined by the main goal – the psychological well-being of a child, children self-realization, the formation of social and communication skills and the overall successful socialization of a child.

In order to achieve this aim we have designed and conducted the empiric study the purpose of which is to diagnose the features of appearance of junior schoolchildren's conflicts and to determine the content of the work dedicated to prevention and correction of such psychological conflicts

Results

The experimental work was carried out provided by State-funded educational institution of Nizhny Novgorod «Secondary comprehensive school № 110». The sample group consisted of first-grade pupils (40 people). The middle age of the children – 7-8 years old. The investigation is both general and individual.

The experiment included three stages:

1. The initial stage, the purpose of which is to diagnose the features of appearance of junior schoolchildren's conflicts.

2. The forming stage, the purpose of which is to organize work dedicated to prevention and correction of psychological conflicts of junior schoolchildren.

3. The control stage, including repeated diagnosis with the methods of the initial stage. The aim is to determine the productivity of the offered remedial and developing program connected with prevention and correction of psychological junior schoolchildren's conflicts.

The empirical study was conducted in order to identify appearances of junior schoolchildren conflicts by applying the interrogation methods, methods of talk therapy as well as by using a complex of diagnostic techniques.

1. The questionnaire of G.P. Lavrentieva and T.M. Titarenko (1992) «Criteria of child's aggression». The purpose is to learn appearance of children's aggressive behavior as the concomitant factor of psychological conflicts.

2. The graphical technique «Kaktus» of M.A. Panfilova (Veliyeva, 2007). The purpose is to determine the features of behavioral reactions of junior schoolchildren.

3. Chromatic test of M. Lusher (Burlachuk, 2007). The aim to determine the features of emotional development and identify child's aggression and anxiety.

4. The diagnosis of self-appraisal by applying the technique «Lesenka» (V.G. Shchur) (Marcenkovskaya, 2008). The aim is to identify the features of child's self-appraisal as well as his/her ideas regarding relation of other people to him/her, the level of awareness of this relation.

5. The techniques of learning about mental conditions «Paravozik» (Velieva, 2007). The aim: to determine the level of junior schoolchildren's positive and negative conditions.

6. Observation of the features of children's communication (the techniques of Smirnova & Holmogorova, 2005). The purpose: to determine the features of cooperation in a group of children.

7. The diagnosis of interindividual relationships in a group by applying sociometric technique «Capitan korablya» (Smirnova & Holmogorova, 2005).

8. Determination of group cohesion with the indicator of Sishor («Psychometric test of K.E. Sishor)» (Volkov, 2008).

9. Parents' questionnaire «Prevention of child's psychological conflicts in a family».

Following the empirical studies in relation to first-grade puppils the results regarding the whole sample group were obtained.

The comparative results of learning about appearances of children's aggressive behavior achieved by applying the questionnaire of G.P. Lavrentieva and T.M. Titarenko (1992) «Criteria of child's aggression» have shown that, in general, the level of appearance of the selected children's aggression is considered as high by both the teacher and the parents. According to the teachers' survey, 45% children have the high level of aggressive behavior, 35% children have the average level, 20% children have the low level. The parents observed that 30% schoolchildren were prone to the high level of aggressive behavior, 50% children were prone to the average level and 30% children were prone to the low level. This statistics requires child correction guidance directed to lower the aggression of specific group of junior schoolchildren.

The diagnosis of the features of appearance of behavioral reactions by applying graphical technique «Kaktus» of M.A. Panfilova (Veliyeva, 2007) discovered that junior schoolchildren experienced unstable state of emotional sphere, and suffered more often than others from such negative emotional appearances as aggression, impulsiveness.

The results of the diagnosis of the features of emotional development obtained with chromatic test of M. Lusher have shown that 50% girls and 25% boys have the high level of aggression and anxiety; 30% girls and 50% boys have the average level; the low level is identified only regarding 15% girls and 25% boys. The analysis of the levels of junior schoolchildren aggression and anxiety based on the chromatic test of Lusher during the initial stage indicates that girls less comply with the pressures and are prone to anxiety more than boys are.

The results of the diagnosis of junior school children self-appraisel based on the technique «Lesenka» have proved the fact that 1/5 children are prone to self-acceptance. It shows the necessity of treatment in the cases of exaggerated self-assessment or low self-esteem. It was discroved that 40% children had self-depreciation as the factor of psychological conflicts. This is a high indicator and , as a result, may become the reason for heightened agression serving as the way of self-protection and self-realization.

The purpose of the technique «Paravozik» was to determine the levels of junior school children positive and negative mental conditions.

By analyzing the levels of junior school children' positive and negative conditions (pic. 2) it can be concluded that negative mental condition is prevailing (80%); 4 children are prone to positive mental condition (20%). Thus, the information also proves the reasons for the children heightened tendency to conflicts.

The observation of the features of children communication was also conducted by applying the techniques of E.O. Smirnova and V.M. Holmogorova (2005).

According to the results of the diagnosis, the high level of communication development is determined in relation to 25%, the average level - 45%, the low level – y 30%. The obtained results indicate that there is interconnection between the children conflict behavior and the level of communication development.

To investigate interindividual relations in a junior schoolchildren group the diagnosis based on sociometric technique «Capitan korablya» (Smirnova & Holmogorova, 2005) was made. The results showed that the level of formation of collective relations in the class was not enough, because there was the high percentage of ignored and rejected children (40%).

The determination of group cohesion by applying the indicator of Sishor (under Rogov's E.I. technique) also showed the low level of junior schoolchildren cohesion.

The analysis of the features of appearance of junior schoolchildren conflicts based in consideration with the observations of their different types of activities, diagnosis of the level of their anxiety and determination of the level of their self-esteem gave the opportunity to identify three level of mental features of appearance of junior schoolchildren behavior, including: high, average and low.

The low level of conflict appearances is characterized by the intention to adequately assess oneself and one's peers, the presence of emotional stability during the communication process, empathy, the ability to perceive a peer as a communication partner the way he is. The low level of anxiety and self-acceptance (or exaggerated self-assess) are characteristic of this level.

The average level of appearance of conflicts is specified by adaptive communication, in the process of which a child from time to time experiences negative moral qualities, the breach of communication rules and conflict situations with peers take place. Moreover, a child is not able to decide on his own whether he should ask for adults' help or keep to himself/herself. There are emotional intelligence, goodwill, empathy and mutual understanding, but in spite of this, overwhelming emotions cannot be always under control. This level is characterized by the levels of both exaggerated and low self-esteem, self-acceptance is rare. The average level of anxiety is found out.

The high level conflict appearances is specified by destructive communication, in the process of which fear of communication or intrusive communication are prevailing, a child is also not able to cope with other fears of different nature. During the communication process, such children don't control their words and actions. If they answer at a lesson, such children either keep silent, or speak much, loudly, but illogical, inconsistent. The characteristics of this level are the high level of anxiety and low self-esteem.

During the empirical study the parents also filled out the questionnaire which according to the results of which the level of family assistance dedicated to prevention of child psychological conflicts and the readiness to cooperate with teachers on this matter were concluded. (таблица 1).

Table 1. The results of parents' questionnaire «Prevention of child psychological conflicts in a family»

Question	Answers
What do you think prevention of child psychological conflicts is necessary or not?	yes – 80 % no – 0 % depending on a situation– 20 %
Do you assist your children regarding correction of his/her behavior as the basis of psychological conflict prevention?	yes – 55 % no – 15 % depending on situation – 30%
Do you want to learn the techniques of assistance dedicated to correction and prevention of child psychological children?	yes – 90 % no –10 %
Can you always determine the mental condition of your child (anxiety, aggression, impulsiveness and etc.)?	yes – 45 % no – 10 % sometimes – 45%
Do you come into conflict with somebody in the presence of your child?	yes – 15 % no – 20 % sometimes – 65%
Do you always know about psychological conflicts of your child?	yes – 30 % no – 25 % partially – 45%
Do you agree that a psychological conflict may be resolved by itself?	yes – 35 % no – 35 % it is difficult to answer – 30 %
Do you want to get the information (in different forms) which connects with organization of children assistance dedicated to correction and prevention psychological conflicts?	yes – 75 % no – 10% sometimes – 15%
How do you relate to your child's success?	praise him in front of others– 45 % praise him face to face – 35 % differently – 20%

The obtained results of the questionnaire have shown the nessesety to carry out an awareness-raising work with parents which concerns prevention and correction of junior schoolchildren conflicts, taking into consideration their proneness to psychological conflicts and their individual features.

Thus, according to the results of empirical study we have determined that junior schoolchildren conflicts are characterized by a set of violations of emotional-volitional sphere (anxiety, aggression, negative mental condition, inadequate self-esteem), as well as the low level of communication development.

In order to reach the purpose at the initial stage – organization of work dedicated to prevention and correction of junior schoolchildren conflicts, decreasing level of conflict appearances in children behavior, we have highlighted the following tasks:

1. Development of the means of children self-discovery.
2. Development of self-confidence, increasing self-acceptance, decreasing level of anxiety.
3. To enrich and diversify the emotional world of a child, teach him correct emotional reactions, junior schoolchildren physical and emotional stress relieving.
4. Improving the ability to successfully realize one's potential through his/her behavior and connections, skill training of self-control in different situations, which emotionally hurt a child.
5. Expansion of cognitive, creative abilities of junior schoolchildren, stimulation of their self-determination, self-development and self-education, a willingness to expand their horizon.
6. Formation of communication competence, communicational culture, relation to moral ideals, ethical standard of behavior, increasing level of good breeding.

7. To correct behavior field.

The listed tasks served as a basis of design for the correction and development program, directed to decreasing level of aggression and anxiety, increasing level of social competence, development of self-confidence, increasing self-acceptance; physical and emotional stress relieving; development of the abilities to do one's best in realizing his/her potential though behavior and relations, communication skill training of junior schoolchildren.

The program included 10 lesson (2 times per week). The lessons were taken after working hours. The duration of one lesson varied from 20 to 40 minutes (depending on the form of the lesson). Preparation and realization of this program were implemented in close cooperation with a social teacher, a form master and the parents of pupils.

The correction and development group lessons in the frameworks of assistance dedicated to correction and prevention of junior schoolchildren conflicts mainly contained games, ability test exercises, purposed for integral psychological development of a child and resolving of the specified psychological problems. Psychotherapeutic techniques increased correction impact.

The designed program also consisted of game trainings aimed at development of junior schoolchildren communication skills directly through the communication process in order to prevent and correct psychological conflicts.

During organizing the assistance the necessity to motivate children, including in order to increase self-acceptance and the opportunities of self-realization was taken into account.

When we corrected the proneness to appearances of conflicts, the autogenic techniques-exercises purposed for regulation of mental condition were implied. It is worth mentioning that the role of theater-playing activities during the forming stage is important. The elements of thearticalization were combines with such social-cultural rehabilitation techniques as game-therapy, doll-therapy, fairytale-therapy, musicotherapy, art-therapy, dramatization, animation, psychodramatic elevation, self-actualization and etc.

In the frameworks of organization of the assistance proccess we taught junior schoolchildren to control their mental condition, form their appropriate behavior. To achieve the literature and didactic games were selected with the purpose of improving the process of emotional-volitional sphere formation.

The particularly important elements are game and project techniques, forming the individual features of junior schoolchildren that can develop only through activities and not can be formed verbally (in group projects, in which a not big group «works» and a final product is created on a basis of joint activity, the following qualities are developing: the abilities to cooperate in a group, to take responsibility for one's choices and decisions, to divide mutual responsibility, to analyze the results of one's activity, to feel oneself a member of a group – to control temperament, character, time for the sake of joint interests). The characteristic of assistance dedicated to development of junior schoolchildren teamwork is activation of relations with parents regarding this field.

Formation of group skills and abilities was also stimulated by both design and realization of education projects that have different purposes including optimization of group relationships. This form, inter alia, was offered for the purpose of jointly carrying out any project by parents and their children according to interests and children education demand and, as a result, gave the opportunity to obtain a certain result

During the control stage the control diagnosis of features of junior schoolchildren appearances was made in order to determine productivity of the offered correction and development program dedicated to prevention and correction of junior schoolchildren psychological conflicts, the qualitative-quantitative analysis of the results of experimental study was carried out, effectiveness of the offered forms and methods of assistance dedicated to prevention and correction of the children psychological conflicts was determined.

The comparative results of learning appearances of children aggressive behavior by applying the questionnaire of G.P. Lavrentieva and T.M. Titarenko (1992) «Criteria of child aggression» at the initial and control stages have shown that, in general, both the teachers and the parents point out decreasing the level of appearances of children behavioral reactions: according to the teachers' observations, 9 children experience positive dynamics (45%), the parents find out that it characterizes 10 children (50%). During the control stage the teaches have observed that 3 children are characterized by the high level of aggression behavior (15%), 10 children – by the average level (50%), 7 children – by the low level (35%). According to the parents' observations, 2 children are prone to the high level of aggression behavior (10%), 5 children – to the average level (25%), 13 children – to the low level (65%). This statistics proves the positive results of the conducted correction work dedicated to decreasing aggression of the specific group of junior schoolchildren.

At the initial and control stages the comparative analysis of the results of diagnosis of appearances of junior schoolchildren anxiety and aggression by using a chromatic test of M. Lusher identified that the level of aggregator and anxiety decreased at the control stage (the high level decreased by 15%). In relation to 45% at the control stage the average level of aggression and anxiety was determined, the low level – in relation to 30% (increasing by 10%).

According to the results of the diagnosis of junior schoolchildren self-acceptance, it may be concluded that following the forming stage of experiment 25% improved their self-acceptance. This fact proves that there is normalization of exaggerated self-esteem and self-depreciation. The appearances of exaggerated and low self-esteem as the factor of conflict have the tendency to decrease. This information indicates that the specific group of children are prone to normalization of the level.

The analysis of the level of junior schoolchildren positive and negative conditions have also shown a positive dynamic. In spite of the fact that there is appearance of different levels of the children negative mental condition, the positive mental condition has increased (by 15%), the high and average levels of mental condition have decreased

Learning the features of appearances of junior schoolchildren conflicts, taking into account the results of the observations of their different activities, diagnosis of the level of their anxiety and determination of the level of their self-acceptance, gave the opportunity to conduct comparative analysis of the levels of junior schoolchildren conflict appearances determined at the initial stage.

The comparative analysis of junior schoolchildren conflict appearances carried out at initial and control stages proves a positive dynamics based on the assistance provided and dedicated to prevention and correction junior school children conflicts: the level of children conflict appearances is determined to decrease by 25%, the low level of conflict appearances has increased by 30% – more than twice.

Conclusion

In general, the results of the conducted analysis indicate optimality and productivity of the offered program purposed for prevention and correction of junior schoolchildren conflicts which was tasted during the experimental study. Therewith, it is worth mentioning that the further work in this field requires prolongation.

Based on the obtained information, the practice recommendations for teachers and parents dedicated to prevention and correction of junior schoolchildren psychological conflicts have been made.

Taking into account that the process of prevention and correction of junior schoolchildren conflicts is quite complex, organization of work in this field requires conscious and widespread using by a teacher the different methods and techniques, selection of which is characterized by the results of the conducted diagnosis.

The results of the theoretical investigation of junior schoolchildren psychological conflicts and their conditions, as well as conduction of experimental study in this field, in the process of which the relevant psycho-pedagogical program purposed for prevention and correction of conflict appearances of junior school children has been designed, prove the following conclusions.

1. The assistance to junior schoolchildren dedicated to prevention of conflicts should be provided in the framework of the next main fields: creating the objective conditions, preventing from the appearance and destructive development of conflict situations; optimization of organizational-administrative operation of educational institution; removal of social-psychological reasons for conflicts; blocking of individual reasons for conflict appearances.
2. The main purpose of psychological-pedagogical assistance involves the selection of the specific way of behavior by a teacher, thanks to which the negative consequences may be minimized and the positive potential in interindividual relations may be maintained.
3. The main types of the activities dedicated to prevention and correction of junior schoolchildren psychological conflicts include: game and training techniques, individual consulting; involving

schoolchildren in project activity in order to form communicative connections, development of the ability to cooperate in a group, teaching the rules of resolving problem (conflict) situations; individual work with the system of child's values; teaching social skills, the ways of effective communication, constructive behavior in conflict situations.

4. The principal methods of prevention of conflict situations in a group of children are to prevent and correct conflicts. The main forms of conflict prevention are the following: learning children self-learning, the ability to control oneself, teaching junior schoolchildren the acceptable ways of anger expression, practice of communication skills in conflict situations, as well as forming such qualities as empathy and trust.

5. Prevention and correction of psychological junior schoolchildren conflicts are characterized by deep involvement of a teacher in the process of communication between children, taking into consideration individual features of each child, as well as the teacher ability to select optimal approaches, including both traditionally pedagogical and connected with psycho-correctional field. The main purpose of psycho-pedagogical correction is considered as removal of communication barriers, development of better understanding of oneself and other people, stress relieving, creation of success opportunities for everyone.

6. In correction work the principle role belongs to the next actions: to provide a child a necessary set of the means and ways of actions in situations which are important for him, to develop the individual effective model of behavior, as well as to create for everyone the opportunities to succeed.

7. The offered program of psychological-pedagogical prevention and correction of junior schoolchildren psychological conflicts is based on a set of games designed for specific goals, training exercises, dedicated to overcome conflict appearances of children behavior, improving their sociability, forming the communication skills, self-confidence increasing and acquisition of self-control skills.

Abstract

The relevance of the study is due to the search for promising directions of foreign student independent work organization, due of transformation trends of the University educational process, the key link of which are electronic resources: interactive computer technologies that activate all activities of the student and accelerate the process of educational information assimilation; computer simulators that contribute to the acquisition of practical skills; interactive testing systems that control the quality of knowledge. The availability and functionality of mobile electronic devices (Internet tablets, netbooks, readers, multimedia projectors, and interactive whiteboards), information and communication applications and programs, the emergence of new devices and equipment also contribute to the effective updating of foreign student independent work in the University educational process. In this regard, the main attention is paid to the substantiation of the theoretical and methodical approach to the use of electronic resources for technological support of the innovative model of a foreign student's independent work in the University educational process. To substantiate the theoretical and practical significance of the implementation of electronic resources for technological support of independent work, the method of pedagogical monitoring was used, with the help of which continuous monitoring of independent work organization was carried out and operational correction of emerging problems was carried out. The article establishes the classification of types and kinds of electronic resources for technological support of a foreign student's independent work in the University educational process; the algorithm of multimedia components' implementation of electronic resources for technological support of a foreign student's independent work. Based on the results of the study, the priority of electronic resources for technological support of a foreign student's independent work is justified and the effectiveness of their implementation is proved.

Keywords: independent work, foreign student, technological support, electronic resources, pedagogical monitoring.

Introduction

The study establishes the priority tasks of higher education of foreign student which is characterized by a focus on the development of social and professional qualities and competencies necessary for future specialists to adapt to the changing requirements of the labor market; orientation on the self-organization and self-realization; motivation for participation in the development of innovative projects relevant to the development of national and global interactions of a new type (Madsen, 1993; Scardamalia, 2004; Titova, 2010; Tomashevskaya, Malinovskaya, 2011; Fomin, 2013; Khalupina, 2014; Wenger, 1997, Davoudi et al., 2018; Fartash et al., 2018; Tatstan et al., 2018). These strategies are justified by the social order of the modern information society to the system of higher education for the training of not only knowledgeable, but also mainly thinking specialist who is able to independently acquire the necessary knowledge and skills for practical activities, creatively regulate the process of self-formation of the necessary competencies. The development of these directions and strategies determines the constant increase of educational time for independent work of the student. In modern University in different disciplines, it reaches 50-80% of the total number of academic hours devoted to their study. At the same time, the study determines that the increase in the budget of time for independent work of a foreign student does not always meet the expected results and does not always provide full quality implementation of the tasks, because:

– the content of independent work, implemented in the mass practice of universities, due to the lack of differentiation and variability, in which the minimum of the individual capabilities, needs and interests of the subjects of educational activities are taken into account, mainly is aimed at the formation of a foreign student's deep knowledge in the field of subjects studied, to acquire the skills of using the acquired knowledge in the educational process, to acquire and develop the experience of classroom and extracurricular forms of creative activity, to develop the skills of knowledge of key concepts and scientific terminology. In General, these important areas replace the goals of independent work of the student's learning activities (Drobyshevsky, 2013; Dybina, 2015; Savchenko, 2010; Fomin, 2013);
– a significant amount of tasks available for independent work is often done formally or simply copies texts of different and available sources including the Internet, in accordance with the traditional levels of organization of independent work at the University: the literal and transformative reproduction of information; independent work on the model; reconstructive independent work; heuristic independent work; research independent work (Bublik, 2014; Ermakova & Galatenko, 1996; Irgalieva, 2011; Kovalev, 2000; Kostromina & Dvornikova, 2007; Titova, 2010);

– poorly are used the resources of technological support of the student's independent work; forms, methods, tools, mechanisms of control, self-control and feedback *student-teacher - educational environment of the University - educational environment of Internet resources*; continuous computer monitoring of the content and results of independent work of a foreign student (Bublik, 2014; Morenko, 2018; Tomashevskaya, Malinovskaya, 2011).

In the current conditions, due to the widespread use of computer and telecommunication technologies in the educational process of the University, the need to rethink independent work is proved. The objective need for discursive filling of its content with new meanings of interactive interaction between teachers and students based on the use of electronic technologies that expand the spatial and temporal boundaries between the subjects of training for communication and information exchange is established (Kovalev, 2000; Petrov, 2009; Senashenko & Zhalnina, 2006; Tomashevskaya, Malinovskaya, 2011).

According to the results of modern research and practical activities of universities the established trends increase upgrade efficiency of independent work of foreign students with the help of electronic resources for technological support of this process (Bublik, 2014; Gordeeva, 2012; Ivanova, 2001; Morenko, 2018; Petrov, 2009; Titova, 2010; Fomin, 2013). In this regard, the main attention is paid to the substantiation of the theoretical and methodical approach to the use of electronic resources for technological support of the innovative model of a foreign student's independent work in the University educational process as the leading conceptual idea of the study. To substantiate the theoretical and practical significance of the implementation of electronic resources for technological support of a foreign student's independent work in the University educational process the method of pedagogical monitoring is used, with the help of which continuous monitoring of independent work organization and operational correction of emerging problems are carried out. The article reveals the modern discourse of the concept *independent work of a foreign student*; establishes the classification of types and kinds of electronic resources for technological support of a foreign student's independent work in the University educational process; determines the algorithm of multimedia components' implementation of electronic resources for technological support of a foreign student's independent work. Based on the results of the study, the priority of electronic resources for technological support of independent work of a foreign student is justified and the effectiveness of their implementation is proved.

Literature Review

It is established that interest in resources of technological support of educational activities for foreign students in the educational process of the University, including the maintenance of independent work of the student is of equal importance and significance along with training activities, actively manifests itself in the mid-twentieth century (Ilyina, 2007; Leuf & Cunningham, 2001; Madsen, 1993). Research results of well-known specialists in the field of information technologies (Bublik, 2014; Kovalev, 2000; Leuf & Cunningham, 2001; Polat, 1997; Scardamalia, 2004; Wenger, 1997) convincingly prove, at present, the integration of pedagogical and information technologies, the emergence of computer multimedia systems and interactive computer programs, the development of telecommunication networks provide universities with unlimited opportunities to build a qualitatively new information educational environment for independent work of a foreign student. A good example is the shared resource - Computer Supported Intentional Learning Environment (CSIL). This is a learning environment supported by electronic resources (Knowledge Forum) (Scardamalia, 2004), empowering possibilities of teachers and foreign students in creating a virtual educational environments for the implementation of the individual approaches to organization of independent work of foreign students: accommodation of learning tasks, materials, sharing research projects, ideas, facts, results of the analysis of independent work, texts, etc. (Galustyan, 2014; Morenko, 2018; Wenger, 1997). In several other studies (Itinson & Rubtsov, 2015; Kostromina & Dvornikova, 2007; Petrov, 2009; Khalupina, 2014), there is a tendency of a radical change of the role and place of personal computers and multimedia technologies in independent work of foreign students. Supporters of the technological support's use for foreign students' independent work (Leuf & Cunningham, 2001; Polat, 1997; Senashenko & Zhalnina, 2006; Savchenko, 2010; Sergeev, 2010; Scardamalia, 2004; Titova, 2010; Wenger, 1997) their positions justify by didactic, informational and electronical - technical benefits of different types of mobile devices (tablets, netbooks, e-readers) and by their fundamentally new capabilities in the organization of the process: rapid transfer of tasks to students, interactivity and mobile feedback; the availability of resources of various search systems to obtain information on issues of interest; unlimited opportunities for the development of technical skills and abilities necessary for the student as an Internet user to communicate and collect information special conditions for the development of analytical skills and abilities to synthesize knowledge into a single whole, to access and select different sources of information, to develop training programs, to place the necessary information on the website of the University or on the subject web page of the teacher. The study finds that despite the fact that electronic resources are widely used as visual, software, management tools in various aspects of educational activities of a foreign student it is groundless to talk about the emergence of a holistic understanding of the technological support of his/her independent work as a pedagogical problem. Finally yet importantly, this contradiction is due to the special variability of the phenomenon of technological support, the qualities of which change after mobile changes in technical means that ensure its existence. Therefore, the study of the features of electronic resources for technological support of a foreign student's independent work in the University educational process seems to be justified and appropriate.

Results

3.1. Independent Work of a University Foreign Student: Structure, Content, Transformation

This study uses: 1) as the most important component of professional training of a foreign student in the educational process of the University, providing targeted, motivated, structured on the totality of actions performed, independent cognitive activity on the basis of indirect system management by the teacher or training program; 2) is carried out by the teacher in the framework of the educational paradigm in the direction of professional training: didactic possibilities of Internet learning technologies; collegial nature of the interaction of the subjects in the educational process; forms, methods, tools, mechanisms of control, self-control and feedback in the course of activity; 3) is accompanied by a permanent computer monitoring of the content (cognitive activity, independence, self-organization) and the results of the student's activity (the level of knowledge, skills to apply the knowledge to solve educational and professional problems, competences of independence and self-organization). It is established that the content of independent work of a foreign student in the educational process of the University is determined by the implementation of the gradual formation of cognitive actions: the student's goal of educational activity-a model of significant conditions of educational activity-the program of their own Executive actions - a system of criteria for successfulness of activity -information about the actual results achieved - assessment of compliance of the real results with the criteria for success-decision-making about the need for and the nature of correction (Kostromina & Dvornikova, 2007; Sergeev, 2010; Titova, 2010; Khlupina, 2010). It is established that the gradual formation of cognitive actions creates the necessary conditions for the implementation of included in the independent work of educational activities: planning by the person the purpose of their activities, educational and professional tasks; giving them a personal meaning; subordination to the implementation of these goals and objectives of other areas of educational activities, interests and forms of employment; correction of self-organization and self-distribution of educational actions in time; self-control of their implementation. It is proved that in this process the active principle belongs to the teacher as a managing subject. The student has the role of a managed subject. Electronic resources of technological support of independent work, their didactic environment with mechanisms of control, self-control, feedback for an objective assessment of results and correction of process of interaction of managing and managed subjects to the level of collegial, partner communication become means of communication between managing and managed subjects (Fomin, 2013). In the course of the research the pedagogical structure of transformations of a foreign student's independent work, which is carried out in the process of:

- planning of independent work (based on the individual characteristics of the goal setting of independent work: awareness and autonomy, efficiency, realism, sustainability, determination);
- Modeling (corrects students' ideas about independent work, creates significant conditions for its transformation in the environment of Internet technologies);
- Programming (reflects the subjective methods and sequence of Executive actions to achieve the goals, due to the types and kinds of independent work);
- Evaluation of results (represents the adequacy, autonomy of self-assessment, performance and behavior, the stability of subjective criteria for assessing the success of the results achieved).

3. 2. Classification of Kinds and Types of Electronic Resources for Technological Support of a Foreign Student Independent Work

It is established that in educational theory and practice of the modern University a strong understanding has been developed of electronic resources as synonyms of didactic material presented in electronic format and used to transmit knowledge to students (Sergeev, 2010; Titova, 2010; Tomashevskaya, Malinovskaya, 2011; Fomin, 2013). It is proved that electronic resources have become a priority structure of the content of a foreign student's independent work; their use becomes a didactic norm, as it allows mastering the theoretical and practical components of the studied disciplines with greater intensity, with an increase in the level, quality and strength of knowledge outside the educational process. It is determined that the most modern and effective types of electronic resources of the University educational process are those that are reproduced on a computer, have a navigation control system and implement the possibility of their adjustment and filling (Galustyan, 2014).

Textual, hypertext, multimedia and presentation types represent classification of electronic resources for technological support of a foreign student's independent work in the University educational process:

- textual-graphical views-the content is presented on the computer screen, does not contain a non-linear presentation. It is based on the standard method of sequential immersion of the person in the studied content (Petrov, 2009; Polat, 1997; Senashenko & Zhalnina, 2006);
- Hypertext-content navigation is characterized by nonlinearity. Text snippets can be viewed in random order, determined by the logical sequence of content, mobility, and motivation of the individual. The disadvantage of this view is the lack of visual and audio series (Ilyina, 2007; Irgalieva, 2011; Itinson & Rubtsov, 2015);
- multimedia views. They are characterized by multi-profile nature, a large volume of memory footprint, extensive capabilities for simultaneous presentation of information in various ways: graphics, photo, video, animation and sound (Morenko, 2018; Osetrin & Pyanykh, 2011; Titova, 2010; Fomin, 2013);
- Presentational. They have the ability to accommodate large amounts of graphic, text and audio

information, combining audio and visual content. Nevertheless, it is difficult to use three-dimensional visual series while the implementation of visual AIDS (Gordeeva, 2012; Ermakov & Galatenko, 1996, Ivanov, 2001).

The established types determine the typology of electronic resources adapted to the technological support of a foreign student's independent work in the University educational process: illustrative (lecture) resources; electronic references, dictionaries; practical (simulators); laboratory work; game scenarios, technologies; automated training systems; control and diagnostic tests.

The established types of electronic educational resources provide unlimited opportunities for the organization of students' feedback in offline and online modes, program management of independent work of a foreign student in the process of individual learning path. The study proves that the development of information and communication applications and programs, the emergence of a new generation of mobile devices and equipment in today's conditions form special requirements for the current classification of kinds and types of electronic resources for technological support of a foreign student's independent work in the University educational process. Among these requirements, there is a special need to modernize the structure of electronic resources, in accordance with modifications of multimedia content:

- updating of navigation devices of electronic resources in search of the necessary information with the help of linearity, which allows you to view pieces of information in the order determined by the logical sequence of content; or nonlinearity, which allows you to use the information in any order, determined by the mobility and motivation of the person;
- clarification of electronic resources' use, taking into account new technical and information achievements: PC, print media, various types of mobile electronic devices (Internet tablets, netbooks, readers, multimedia projectors, interactive whiteboards, etc.));
- correction of means of interactive access, animation of dynamic illustrative materials, video images, demonstrating mobile principles and methods of implementation of individual processes and phenomena on personal computers or local computer networks.

3.3. Algorithm of Realization of Multimedia Components of Electronic Resources for Technological Support of the Foreign Student's Independent Work

To implement the established structure of the algorithm the study justifies navigation; subject-content, subject-process; information and reference, activity-based components of multimedia electronic resources for technological support of independent work, as well as means for assessing the student achievements, controls and communication means.

Navigation component. It supports independent work of a foreign student to master the content of the discipline. This component includes the necessary means of technological support of the student when working with text material, printing the necessary fragments of the navigation device (table of contents, signals, symbols, alphabetical, nominal and thematic pointers, user bookmarks, notes, etc.), providing a quick search for information, the transition to the desired Chapter or paragraph, reflecting the relationship between the main and additional material, as well as allowing the student to track and adjust their user level in electronic resources.

Subject-content component. It contains General information about electronic resources (goals, objectives, place in the educational process, on what disciplines is based and what disciplines supports); the content of sections, a list of topics and sub-topics of the discipline; guidelines for the study of educational material, questionnaires and sheets for monitoring the assimilation of knowledge by students.

A subject and procedural component. It contains the basic components of the organization and implementation of independent work in each discipline individually. It defines the scientific content, methodical structure and sequence of study of the discipline. The quality of study of the discipline can be significantly higher if the methodical recommendations or guidelines for its study are used, which provide navigation of the student in the content of the studied material.

Information and reference component. It contains educational, methodical and information resources that support the independent work of the student of information-search and problem-practical nature. Among them, there can be terminological electronic dictionaries, grammatical reference books, electronic libraries, the list of the recommended sources of information for independent studying, the list of addresses of additional information resources of the Internet (remote courses, business computer games, electronic encyclopedias, and information materials), approximate lists of subjects of project works and requirements to their registration.

The activity-based component. It is intended for fixing the educational and professional knowledge, abilities and skills gained in the course of independent work. The activity component provides the student with mastering the techniques of cognitive activity, develops interest in creative work, the ability to solve scientific and applied problems. It can present practical tasks, both in the form of tests and in the form of collections of tasks (exercises), depending on the specifics of the discipline.

Means of evaluation of educational achievements of independent work of a foreign student. They ensure the collection of current and effective information about the student's learning activities and provide him/her with information on completion of the work in the form of a Protocol of results. Electronic testing is a formalized type of control. Working with training control tests and self-control systems can provide explanations in the case of a wrong answer and recommendations for the use of a textbook, thesaurus or additional material. In the case of placing an electronic educational resource on the Internet-server of the educational institution, it may be provided that the teacher receives information about the results of each student's work through e-mail resources.

Control means. They provide the student with the opportunity to freely choose one of the three modes of operation in the electronic learning environment - self-government, differentiated management by the teacher and management by software learning. The first two types of management are due to the human factor-the student and the teacher and the level of communication between them. The mode of the program means of training provides management of independent work of the student in the course of passing of an individual trajectory of training and in this case, electronic means fix all achievements and mistakes of the student according to the set program.

Means of communication. They are intended for the organization of electronic interpersonal communication between subjects of training with the use of asynchronous and synchronous communication. The learning process in this case is of an active activity-communicative nature.

The research substantiates didactic priorities of multimedia components of electronic resources for technological support of a foreign student's independent work in the University educational process:

– interactive nature of communication between teachers and students, innovative types of control and self-control, implementation of feedback through various test systems available to all entities (teachers and students) at the same time, monitoring the process and results of independent work;
– search, processing, storage and presentation of information: the formation of the ability to enter, edit and display text on electronic resources; work with graphic information, the use of a computer for calculations, the preparation of spreadsheets; the search for data from various sources, the use of abstract information, checking it for accuracy; the organization of storage of information, adequate forms of its presentation; the use of information to solve problems);
– expansion of spatial and temporal boundaries for communication, information exchange, access to electronic libraries, encyclopedias, dictionaries and other information resources;
– ensuring active interaction of students in the process of collective independent work to find a solution to a problem, obtaining the necessary advice in a remote format, exchange of experience with other students;
– innovative nature of educational tasks' presentation to students through greater clarity, variability, expansion of the thesaurus, the use of a set of situations and tasks of different levels of complexity, increasing the number of information resources to find the necessary knowledge, electronic lecture notes, Bank control tests, orientation (technological) maps, samples of work, regulatory requirements, multi-level educational and professional tasks, options for the content of the subject page of the teacher ON the web-site of the Department, University;
– constant (online) monitoring of students' independent work, correction of its course and directions of searches in solving educational and professional problems;
– practical orientation of independent work based on virtual training, laboratory work, workshops.

It is proved that the use of multimedia components of electronic resources for technological support of students' independent work in the University educational activities provides effective implementation of individual routes of the student: focused on obtaining knowledge; on the formation of himself as an educated person; on the formation of himself as a future specialist; focused on scientific activities.

Conclusion

The study confirms the theoretical and practical importance of electronic resources for technological support of a foreign student's independent work in the University educational process as an actual direction of his/her professional training. Based on the results of the study, the importance of electronic resources is confirmed, the priority component of which are multimedia technologies that activate all activities of the student, accelerate the process of assimilation of educational information and control the quality of knowledge. The availability and functionality of mobile electronic devices (Internet tablets, netbooks, readers, multimedia projectors, and interactive whiteboards), information and communication applications and programs, the emergence of multimedia devices and equipment contribute to the effective renewal of independent work of a foreign student in the educational process of the University. It is proved that a new, multimedia generation of electronic resources for technological support of a foreign student's independent work activates the increase of General cultural, professional and communicative competencies; orients the person to acquire knowledge and skills of working with educational and cognitive information on modern media; develops techniques of creative and mobile orientation in the flow of constantly changing information; expands the spatial and temporal boundaries of cognitive activity in the interactive interaction of the student with teachers, in the process of communication and information exchange with fellow students. In this regard, the article substantiates the theoretical and methodical approach, the key element of which is the use of electronic resources for technological support of a foreign student's independent work in the educational process of the University. To substantiate the theoretical and practical significance of electronic resources' implementation for technological support of a foreign student's independent work in the University educational process, the article reveals the structure, content and transformation of the modern discourse of a foreign student's independent work; the classification of kinds and types of electronic resources for technological support of a foreign student's independent work in the educational process; the algorithm of multimedia components' realization of electronic resources for technological support of the foreign student's independent work is defined. Based on the results of the study, the priority of electronic resources for technological support of independent work of a foreign student is justified and the effectiveness of their implementation is proved. This problem as a research area is not limited to the solution of the goals and objectives. Important for the formation of the personality of a foreign student is the justification of models for the implementation of his/her individual routes in independent work, focused on obtaining knowledge, on the formation of themselves as an educated person, as a future specialist, as a scientist, researcher.

Administrative Anti-Corruption Law in the Social Sphere in Accordance with International Standards

Alexander V. Polukarov[1]
[1] *Department of Administrative and Financial Law, People's Friendship University of Russia (RUDN University), Moscow, Russia.*
**corresponding author*

Abstract

The study aims to show the scope and limits of administrative anti-corruption regulations, to detect the causes and factors leading to corruption in the social sphere and to identify the possibility of reinforcing administrative anti-corruption means, including in accordance with international standards. A dialectic approach to the examination of social phenomena made it possible to analyze the above issue in historical perspective and the comparative analysis was used to compare Russian anti-corruption legislature with international legal instruments and the anti-corruption laws in force in selected countries. The study defined administrative enforcement as a means of counteracting corruption in the social sphere, determined various administrative procedures adopted in anti-corruption mechanisms and highlighted a discrepancy between Russian anti-corruption legislature and international laws. For the first time in research on administrative law, the study focused on the adoption of administrative anti-corruption regulations in the social sphere in accordance with international legal standards.

Keywords: counteraction, corruption, social policies, health services.

Introduction

Traditionally, the public administration system uses methods such as persuasion and enforcement. Without starting a discussion on the functional and institutional aspects of these methods, let us focus on the potential of using administrative enforcement in anti-corruption strategies in the social sphere (Denisov, 2004). To reveal the gist of administrative anti-corruption actions, objective attention should be paid to the law enforcement institution in general, which is the basic category in relation to administrative enforcement (Plokhoy, 2015).

In this regard, a number of ideas should be put forward as a basis for a research on administrative enforcement in the anti-corruption mechanism in general and in the social sphere, in particular.

First, administrative enforcement is part of public enforcement implemented by anti-corruption actions.

Second, administrative enforcement measures are part of administrative anti-corruption legislations and, therefore, their effective implementation in the sphere under investigation depends largely on the quality of other administrative legislations.

Third, the classical approach to defining the content of administrative enforcement has not proved very efficient in combating corruption (Khasanov, 2015).

Fourth, the potential of administrative enforcement measures remains scarcely implemented, despite specific aspects of the fight against corruption (Khasanov, 2015).

Research Methodology

The present study adopted the system approach that addressed administrative anti-corruption law in the social sphere in terms of the identification of trends and interactions inherent in its structural elements and, on the other hand, of the focus of administrative anti-corruption measures on achieving the expected results.

The research also used the comparative law method (when analyzing the establishment of the administrative anti-corruption legal system in the social sphere in a number of countries), the formal study of documents and research studies on the topic under investigation. The method of formal logical analysis was needed to examine legislative and subsidiary acts regulating anti-corruption issues.

The research also draws on the structural and functional method and certain elements of the sociological, historical and axiological methods of research. The rationale for adopting the above-mentioned methods is the authors' effort to integrate the largest possible methodological framework offered by various sciences (philosophy, political and legal sciences as well as sociology) for the study of administrative anti-corruption issues in the social sphere.

The combined research methods used in the present study, first, identified the areas and scope of research and, second, provided an opportunity to fully assess the content of the issue concerned and to canvass a comprehensive understanding of administrative anti-corruption law in the social sphere.

A review of research studies indicates that our research topic is sufficiently well explored in terms of criminal law and criminology. In particular, S.V. Plokhov (2013) and T.A. Balebanova (2013) did their doctoral theses on this issue. Over many years in recent history, a number of administrative law researchers have investigated the administrative aspects of the fight against corruption. As an example, A.S. Dylkov (2015), A.V. Kurakin (2008), M.M. Polykov (2009), D.A. Povny (2011) and A.A. Shevelevich (2008), among others, conducted special research in this area.

Results

Issues relating to the progressive development of our society are particularly due to major deficiencies in institutional measures to combat corruption, especially in the social sphere. The quality of human life and people's financial and moral well-being eventually depend on whether the problem with street-level corruption is resolved or not. Today, it is still common practice that the government channels its major effort into fighting corruption in public and municipal services, whereas other spheres of public administration – especially those of decentralized nature in terms of legal regulation and administration – remain without proper protection against corruption. Due largely to this circumstance, corruption keeps growing in different areas of the social sphere.

As the Minister of Internal Affairs of the Russian Federation mentioned at the Meeting of the Anti-Corruption Council Presidium held on 15 March 2016, "…criminal intrusions mostly concern the sphere of procurement of goods, works and services for provisioning governmental and municipal needs, construction, motor road maintenance, public health services, education, science and culture" (Fair.ru, 2016). Corruption in the public and regional administration is heterogeneous and volatile. As an example, according to the data provided by Russian Procurator-General's Office, the total sum of bribes received was 2.3 billion rubles in 2016, one billion rubles more than in 2015.

33,000 corruption crimes were registered in 2016, down 1.4% from 2015. The average amount of the bribe was 425,000 rubles in 2016, up 1.4% from 2015. In 2016, a total of 12,000 corruption cases were brought to court and 13,000 people were convicted. Moreover, 2.5 billion rubles were voluntarily returned to the State in 2016 and measures were taken to recover the corruption-related property damage totaling 33 billion rubles (Lenta.ru, 2017).

Unfortunately, socially oriented priority national projects and programs have been undermined. As an example, increased funding for the Health Program has not improved the quality of medical services provided and health care shows the highest percentage of corruption. The diversion and misallocation of public funds remains the central problem with the implementation of the nation-wide Education Project almost in all the constituent entities of the Russian Federation. The program entitled Accessible and Comfortable Accommodation for Russian Citizens is not fully effective, due, among other things, to corruption. The situation regarding the implementation of another program, Reforms in the Housing and Communal Services Sector, is no better.

This situation suggests the need to identify new priorities regarding the implementation of public anti-corruption policies and the improvement of administrative anti-corruption law, taking into consideration current public relations in the social sphere.

Unlike other areas of public administration, the social sphere is specific in that it involves most citizens and both publicly funded and extra-budgetary social institutions and organizations provide social services, which – for objective reasons - often operate as economic competitors, i.e. health care centers, educational institutions and so on. The lion's part of public funding goes to the social sphere. As an example, in 2017, the following publicly-funded state programs were funded as follows: Development of Health Care (3 971 027.7 rubles); Development of Education for 2013-2020 (37 403.9 rubles); Social Support for Citizens (1 079.7 rubles). All public funding should be spent only to the targeted recipients.

The problem is that the main effort of the State is to combat corruption in government agencies and administrative bodies, which understandably do not provide social services. As a result, the social sphere remains without proper protection against corruption, which leads to the unlawful charging for otherwise free services in high social demand (health care, education, physical training and sports). In this regard, corruption pushes out, in a coherent and systematic manner, citizens from the system of free social services resulting in the growth of social tension and in the diminishing trust in the central sphere of life, i.e. the country's social policy, on the part of citizens.

An issue of particular concern is the fact that there still is no official definition of the term "social sphere". Instead, there is a list of healthcare, educational and social activities involving legal personalities and individual entrepreneurs.

The No. 296 Order of the Government of the Russian Federation of 15 April 2015, entitled On Approval of the Social Support for Citizens State Program of the Russian Federation, mentions the following subprograms:

1) Social protection of certain categories of citizens;
2) Upgrading and promotion of social services for the population;
3) Enhancement of effective public support for socially oriented non-profit organizations;
4) Older generation;
5) Provision of conditions for the implementation of the Social Support for Citizens Stage Program of the Russian Federation.

Based on the above, the main beneficiaries of public social programs are not only legal and natural persons providing social services and support, but also the so-called unprotected citizens who suffer most from corruption in the social sphere. This is why corruption, along with other causes, leads to negative consequences such as increased and unsubstantiated spending by citizens and misallocated state funds, which should have been used to deal with socially important issues but, instead, have ended up in the pockets of officials. In our view, the recently established decentralized nature of social administration does not make it possible to build an effective administrative anti-corruption legal system. Accordingly, it is suggested that administrative anti-corruption law in the social sphere should be promoted in a fundamentally different way, considering its features and needs of law enforcement practices. Now, a number of primary tasks should be tackles to overcome corruption in the social sphere.

First, forms and methods of administrative anti-corruption regulations should be unified to the maximum in the social sphere at its various levels.

Second, specific features of public relations should be taken into consideration, which are established in this or that segment of the administration and functioning of the social sphere.

The research shows that departmental anti-corruption plans do not sufficiently highlight measures taken to record the activities of various public and administrative anti-corruption bodies in performing these or those public functions. This reduces the law-enforcement capacity of these documents in anti-corruption actions and the effectiveness of administrative anti-corruption regulations. Meanwhile, a differentiated approach to dealing with corruption might help identify its distinctive features and find proper administrative legal ways to influence it.

It should be recognized that reducing corruption in the social sphere is impossible without imposing public and private law regulations in other sectors.

As of now, there is an acute need to carry out strict anti-corruption policies both in the public and private economic sectors. It is axiomatic that economic problems are at the basis of corruption, specifically in the social sphere. In this regard, addressing a wide range of economic issues may help reduce corruption both in the private and public social services sector.

The specific nature of the social sphere's functioning is related to its areas of activity and to the fact that administrative law regulates its basic relations. Accordingly, proper administrative anti-corruption measures introduced to the social sphere may make a positive contribution to resolving the issue under investigation. In terms of its institutional framework, administrative anti-corruption law should comprise components of various functional nature. As an example, the development of legal, organizational, informational and technological components is necessary to effectively combat corruption in the social sphere. Each of the above-mentioned aspects can be used, in their own way, to ensure the functioning of the anti-corruption mechanism in the social sphere.

Administrative anti-corruption law should combine both regulatory and protective anti-corruption means. Such an approach will reduce to a maximum corruption risks in the social sphere and the corresponding law enforcement activities. Of special importance in enhancing the effectiveness of administrative anti-corruption law is the removal of contradictions between the regulatory and law enforcement practices in anti-corruption measures implemented in the social sphere.

The development of a comprehensive theoretical model of using administrative and legal arrangements to combat corruption in the social sphere will decrease social tension in Russia. Furthermore, more focus should be placed on national and international legal standards and related rules of international law. The removal of contradictions in the system of administrative anti-corruption law in the social sphere will help to determine the main elements of offences in this sphere, to differentiate them from contiguous acts and to counter offences in this sphere by filling gaps in administrative law and improving its practical applications. From this perspective, a comprehensive research on administrative anti-corruption law in the social sphere seems necessary and urgent.

Administrative anti-corruption regulations are mostly based on the related international legal standards. As an example, the Federal Law on Counteraction of Corruption of 25 December 2008 highlights that the State's cooperation with international organizations is one of the principles underlying anti-corruption measures (Art. 3, Para. 7).

Today, a system for the international legal cooperation between states has been established to combat corruption, which is a comprehensive mechanism for states to interact at universal, regional, sub-regional and bilateral levels. Corruption impairs the social activities of all members of the world community. The social sphere cannot flourish in a corrupted system, which leads to population reduction in this or that country and to the decrease of funds that the government has to allocate to working people and to the purchase of supplies (books, medicine, computers and so on). Corruption also leads to the misallocation of public funds provided for social services (schools, hospitals, roads, police and so on), hence the decreased quality of services. Favorable conditions are created for people with money and connections to amend laws and decisions taken by public authorities. Finally, corruption undermines the credibility of the government. The difficulty is that there are no international acts on corruption in the social sphere (at least, universally), which creates a need to introduce and pass them.

Having ratified the United Nations Convention against Corruption, Russia did not subscribe to the provision concerning corruption crimes such as illicit enrichment and the responsibility of legal persons, which is a gap, in our view. The following documents deserve attention in terms of systematic administrative anti-corruption enforcement strategies in the social sphere:

– the Inter-American Convention against Corruption, signed by the Organization of American States on 29 March 1996 (given that all anti-corruption measures suggested by this convention are substantiated and preventive; and
– the Convention on Combating Bribery of Foreign Public Servants in International Business Transactions of the Organization for Economic Cooperation and Development (hereinafter OECD), adopted on 21 November 1997 and aiming at the criminalization of legal persons' corruption activities.

Attention should also be given to the project carried out by the OECD (2013), The Integrity of Educational Systems (Intégrité des systèmes d'enseignement), which seeks to provide assistance to States in their fight against corruption in the educational sector by analyzing the corruptogenic factors in the educational system.

The Program of Action against Corruption, adopted by the Committee of Ministers of the Council of Europe in 1996 (2011), also requires thorough examination, as its Administrative Law Section (Unit 3) contains a number of terms related to the codes of conduct of officials. The Model Code of Conduct for

Public Officials, which is an appendix to the Recommendations of the Committee of Ministers of the Council of Europe of 11 May 2000 No.R (2000), also addresses the issue relating to ethical rules and codes of behavior for public officials.

It would be desirable that Russia should join international movements, such as the World Health Organization's network for fighting corruption in the drug purchase sphere. It is also advisable that Russia analyze data obtained and take appropriate measures, based, for instance, on the data provided by the Report on the extent of Corruption in Education in 60 countries (including Russia), prepared by the UNESCO International Institute for Educational Planning.

Although Russia is a member of the World Health Organization, it did not join the following serious international organizations combatting corruption in the healthcare sector, not even as an associated member: European Healthcare Fraud and Corruption Network (EHFCN), Center for Counter Fraud Services (CCFS) affiliated with the Portsmouth University (Great Britain), European Observatory on Health Systems and Policies and others.

For instance, the European Healthcare Fraud and Corruption Network adopted in 2005 the European Declaration on Healthcare Fraud and Corruption in Europe.

Unfortunately, there are no acts directly aimed at combatting corruption in the social sphere within the framework of the Eurasian Economic Community and the European Union.

To sum up, Russian legislation does not quite correspond (or does not correspond at all) to international anti-corruption regulations, which calls for thorough revision, given the gravity of this issue in Russia.

Specificities of countering corruption in the social sphere abroad. Until recently, the absence of special compositions of corruption delicts committed in the social sphere has been a common feature of corruption offences both in Russian and in many other countries. Countries such as Austria, Great Britain, Denmark, India, China, the USA, Switzerland and Finland have no legal definition of the notion of corruption, which is why the punishment for corruption is administered for specific lucrative acts on the basis of legally defined terms such as bribe, bribery, abuse of authority and so on.

Among corruption infringements are both corruption crimes stricto sensu and other infringements of law committed for lucrative purposes.

Foreign law highlights a number of corruption infringements committed, particularly, in the healthcare sector. These wrongful acts run counter to the notion of corruption, as defined by Russian legislation. As an example, distinctions are made between bribery in medical service delivery, procurement corruption, improper drug-marketing practices, undue reimbursement claims, etc. (Örtenblad, Löfström & Sheaff, 2015). In our view, such definitions facilitate the classification of corruption infringements.

The United Kingdom of Great Britain and Northern Ireland, in its Bribery Act of 8 April 2010, defines bribery as one person's agreement to receive "a financial or other advantage", which constitutes "an improper performance of a relevant function or activity" (Art. 1). Evidently, such a broad definition makes it impossible to determine the corpus delicti (Polukarov, 2017c).

Among the main punishments in all countries are imprisonment and imposition of fine on the offender, which is logical in case of lucrative crimes, usually involving monetary rewards.

Almost in all States, corruption crimes are considered as serious wrongful acts.

The most difference between foreign law and Russian anti-corruption legislation is the criminal responsibility of legal persons for corruption crimes. The significance of legal persons' responsibility for corruption infringements committed in the social sphere could not be overemphasized, given that public administration does not have exclusive jurisdiction over the social sphere (healthcare and education), in contrast to the traditional areas administered by public authorities (law enforcement, administration of justice and provision of security).

Privately owned entities (educational organizations, hospitals and pharmaceutical companies) are active participants in the social sphere that provide social services similar to public organizations. As a result, legal persons (economic entities and non-commercial organizations) provide a wide variety of social services and, thus, can be considered as potentially inclined towards criminal activities in the sphere under investigation. Relevant circumstances point to the significance of strengthening their administrative responsibility for corruption infringements. In a number of foreign countries, a combination of criminal and administrative measures are taken to combat corruption. Besides, legal remedies against corruption are largely homogeneous, hence a high demand for them in both public and private areas of social service delivery (Polukarov, 2018).

Issues relating to the implementation of corruption-related international legal standards into Russian legislation. International legal anti-corruption standards in the social sphere are of great significance for the improvement of Russian legislation. However, not all relevant provisions of international legal acts are introduced to Russian legislation on countering corruption, which has a certain negative impact on the quality of anti-corruption state policies. In recent years, Russian government authorities have taken significant steps in the fight against corruption: a relevant legal framework has been established, institutional changes have been made and measures have been taken to involve citizens in the prevention and suppression of corruption. At the same time, anti-corruption measures in a number of areas of social relations, require additional regulations, means and techniques (Polukarov, 2017b).

By tradition, the social sphere remains one of the most corruptogenic ones, which is due to the insufficiency and incoherence of anti-corruption legislations, closed activities of social and other institutions, somewhat ineffective public and social oversight that is not always highly effective, inefficient preventive measures, greedy interest of the parties in maintaining corruption-related connections and more.

Among factors contributing to the growth of corruption in the social sphere are the subjects' confidence in marginal patterns of behavior (legal infantilization and nihilism), and this despite the fact that the State allocates significant funds to the social sphere.

The Federal Law No. 97-FZ of 4 May 2011 ("On the amendments to the Criminal Code of the Russian Federation and the Code of Administrative Offences of the Russian Federation on improved anti-corruption governance") has implemented international standards to Russian legislation by expanding the range of persons who could be prosecuted for receiving bribes. This law, however, has a significant omission, in our view: it lacks the definition and, most importantly, the legal applications of terms such as active bribery and passive briber, introduced in 1999 by the Criminal Law Convention on Corruption of the Council of Europe.

Another major gap is the absence of provisions for corruption in both the Code of Administrative Offences of the Russian Federation (CoAO RF) and the Criminal Code of the Russian Federation (CC RF). In our viewpoint, there is a real need to define and legislate on terms such as "corruption infringement" and "corruption crime", given that both the CoAO F and the CC RF contain only special provisions.

The international community considers confiscation of property as the most serious means of combating corruption. The Criminal Law Convention on Corruption suggested that States should adopt legislative and other measures that may confer them the right to confiscate or exempt in other ways instruments of crimes and earnings from crime activities, recognized as such in accordance with the present Convention, or property of a value equivalent to that of such proceeds (Art. 19). In this regard, and considering Russian law enforcement practices, we deem it necessary to restore confiscation as a type of punishment.

In promoting anti-corruption regulations in the social sphere, it should be kept in mind that Article 1 of the Civil Law Convention on Corruption of the Council of Europe, adopted 4 November 1999, requires each party to provide in its domestic law for effective remedies for persons who have suffered damage as a result of corruption, to enable them to defend their rights and interests, including the possibility of obtaining compensation for damage. At the same time, the author points out, according to Article 5, the possible responsibility of the State as an entity that authorized the official (or other) person to act on its behalf. In Russia, however, there have been almost no cases where a citizen was granted reparation for material or moral harm incurred as a result of corruption acts. The real implementation of reparation mechanisms would make the authorities more attentive when appointing persons to managerial positions and would result in the legal competitive selection of officials (Polukarovm 2017a).

The Convention of the Council of Europe suggests that members States criminalize deliberate acts related to corruption abuses or inaction aimed at concealing or misrepresenting information when preparing or using invoices or any other accounting document or report, which contains false or incomplete information, or when illegally omitting to make entries on accounting reports concerning payment transactions. The CC of RF features only a general rule on forgery (Article 292), and the examined practice reports lead to the conclusion that forgery concerned mainly sick lists and various official documents, whereas invoices, other accounting documents, reports and accounting records are not such. This situation seems to be a notable omission, given that the above-mentioned documents can be used to commit other, socially dangerous infringements. We consider it necessary to add "accounting documents" and "accounting records" to the Article 292 of the CC of RF, which would increase responsibility for real forgeries in public office. As a reminder, a Consolidated Report on Russia was published 15 March 2013 as a supplement to the report on the implementation of recommendations by the Russian Federation. Unfortunately, this Report has not had any significant impact, which is clearly an omission (Polukarov, 2016).

Discussion and Conclusion

If Russia ratifies the Civil Law Convention on Corruption of the Council of Europe, it will be possible to cooperate on civil actions against corruptions, in particular, in obtaining evidence abroad, in establishing jurisdiction, recognizing and respecting foreign judicial decisions and court fees. The provisions of the United Nation Convention against Corruption (Article 13), adopted by the United Nations General Assembly on 31 October 2003 by Resolution 58/4, stipulates that each member State will take measures to actively involve the civil society in the prevention of and fight against corruption. The following measures are aimed to increase such participation:

- improving transparency and involvement of the population into decision-making processes;
- providing the population with effective access to information;
- holding public-awareness events, which would foster public intolerance against corruption, and promoting educational programs, including school and university curricula;
- respecting, encouraging and protecting the freedom to seek, receive, publish and disseminate information concerning corruption.

Clearly, these measures to be taken by public authorities are rather general and need further specification in national legislation. In this regard, we consider it an urgent need to regulate in more detail the forms and methods of interaction between public authorities and civil society.

Unlike previous research, this article developed a major conceptual framework for the promotion of administrative corruption regulations in the social sphere, based on international anti-corruption standards, as well as conditions and requirements necessary for the effectiveness of new legal techniques, forms and methods in undertaking preventive measures to reduce corruption in the social sphere.

Another new provision concerns the definition of theoretical and law enforcement practices aimed at countering corruption in the social sphere. In structural terms, it should include the organizational, informational and law enforcement components. The present study proved that effective anti-corruption measures in the social sphere are possible only if all of the above components are combined, in which case they will provide an effective mechanism for the implementation of administrative anti-corruption actions in the social sphere.

The present study proved the need to extend administrative anti-corruption strategies to the entire social sphere and substantiated the fact that these strategies should not be limited to use only by public authorities in the social sphere. It was shown that, due to the regulatory and protective impact of administrative anti-corruption strategies, they should institutionally affect the entire social sphere, while taking into account, in functional terms, the performance of each of its segments. Equally revealing is the finding that an integral part of State social policy should be the fight against corruption in the social sphere and, consequently, in public programs for the promotion of these or those components of the social sphere. The consolidation of anti-corruption measures should follow their implementation.

The research novelty of the study consists in the proof that the content of the administrative anti-corruption regulations in the social sphere is based on legal remedies, the implementation of which should take into consideration their essence in terms of target, subject, industry, institution and function. The study provided a theoretical framework for the provision that general anti-corruption measures defined in legislative and relative acts do not take into account the specificity of corruption's manifestations in the social sphere, which decreases their regulatory and protective potential. This said, the study proved the need to develop and adopt special regulations aimed at countering corruption in the social sphere using administrative and legal arrangements.

Recommendations

The obtained research findings make it possible to develop specific areas of public anti-corruption policy, as their primary objective is to improve administrative anti-corruption regulations in the social area, in general, and also in its most significant segments. The research provides an opportunity to expand the boundaries of anti-corruption legislation and to remove individual contradictions related to the implementation of this legislation in the social sphere. The obtained research findings reveal the theoretical and law enforcement regulations relative to anti-corruption measures taken in the social sphere, so they have a direct practical significance in terms of the following:

– development of suggestions on improving the legislative and departmental anti-corruption regulatory activity in the social sphere. As part of the study, amendments have been developed to the Federal Law of 25 December 2008 No. 273-FZ (On Countering Corruption), the Federal Law of 17 July 2009 No 172-FZ (On Anti-Corruption Regulation of Legal Acts and Draft Regulations) as well as the letter from Russia's Ministry of Labor of 13 November 2015 No 18-2/10/P-7073 (On the Criteria of Prosecution for Corruption Infringements);
– implementation of anti-corruption arrangements in the social sphere and identification of corruption-prone activities in the federal executive bodies exercising its functions in the social sphere;
– anti-corruption policies in terms of methodology and didactics. Specifically, the results of the study can form the basis of teaching various courses on anti-corruption strategies. Furthermore, the research findings can be used to elaborate the content of the Master Plan to Counter Corruption in Federal Executive Bodies Exercising Its Functions in the Social Sphere.

Abstract

The purpose of this article is to analyze the study specifics in modern sociological science of social Internet networks' impact on the socialization of young people. The paper uses the methods of comparative analysis, system and structural-functional analysis, generalization. The article analyzes the existing methodological approaches in modern sociological science, which can be used in the study of the specifics of social Internet networks' impact on the socialization of young people. It is established that the study of social Internet networks' impact on the socialization of modern youth is advisable to carry out through the integrated application of several methodological approaches. The combination of different approaches allows us to consider such aspects of social networks' impact on the socialization of young people as the accumulation of virtual and real network connections, the formation of social values, the presence of socialization risks and the transmission of behavioral guidelines of both positive and deviant nature.

Keywords: socialization, social Internet networks, youth, socialization risks, virtual communication, digital technologies, social capital,**m**information society.

Introduction

The role of social networks in the process of youth socialization is a largely unexplored aspect of the study of both virtual communications and modern forms of socialization process. This is due to the fact that at present, the existing classical and relatively recent ideas about the process of socialization and its agents have gradually lost their relevance and scientific adequacy.

There is a need for a serious conceptual review of these perceptions, taking into account the changes that are taking place and that have already taken place. However, while virtual communication is rapidly growing, becoming more complex, changing, sociological science is not so dynamic and simply does not have time to analyze the current changes that occur in the communicative space of the Internet. This determines the significant difficulties associated with the sociological conceptualization of the phenomenon of social networks and network communication.

The multi-paradigmatic character of modern social science, which is one of its main advantages and benefits, allows us most effectively to use the different approaches developed in the science concerning the study of social networks' influence on process of socialization.

The toolkits of different approaches, their emphasis on individual nuances and features of socialization greatly facilitate the task of studying the process from different angles, in its various aspects, but the researcher faces a more complex task of analysis and rethinking of numerous concepts in order to form a holistic scientific knowledge of the problem. The solution of this problem is not possible without reference to the theoretical studies of the classics of sociological science, despite their antinomicity, the presence of mutually exclusive and contradictory provisions in various scientific concepts.

Materials and Methods

In modern sociology, a number of methodological approaches have been developed, each of which offers its own vision of the phenomenon of social networks and their impact on social processes, including the socialization of young people.

Thus, the neo-institutional approach, based on the concept of M. Castells (2000), focuses primarily on the transformations' study of interactions and relationships between the state and society under the influence of the development of network communication. This approach belongs to the paradigm presented by the theories of *information society, knowledge society*, the theory of global network society. The concept of *information society* has become firmly established in the social and humanitarian discourse a few decades ago, when information and communication technologies were just beginning to have a large-scale impact on the social and cultural development of the world.

Japanese, American, and then European sociologists introduced the term *information society* in the second half of the twentieth century, emphasizing that it is information and knowledge that acquire dominant positions in the modern world, become the main commodity, value and tool at the same time.

The foundations for the future concept of the information society were not accidentally formed in the 1960s-1970s in Japan, where computer technologies were rapidly developing and were actively introduced into production and social sphere. Nevertheless, if the original research of the *coming* information society was reduced to technological aspects, i.e. to the positive impact of computerization on the economy and public life, the deepening of ideas about the information society has raised questions that are more global.

In parallel with the concept of the information society, perceptions of modern society as a post-industrial society have developed. D. Bell (1999), listing the main characteristics of post-industrial society, names among others (transition from the economy of production to the economy of service; the power of managers; the dominant role of knowledge as a source of innovation; management of technological progress) and intellectual technologies, which imply the emergence of computers and computerization of all spheres of social life of modern society without exception (Bell, 1999).

Becoming successful, socially successful person associated with the information skills and knowledge, their application that determines the significance of information technology in the process and education and of socialization in General. Possession of information skills and technologies, the ability to work with information becomes not just an advantage – in modern society, it is a necessary skill, without which the individual is doomed to the position of a social outsider.

M. Castells (2000), who can be attributed to the largest modern researchers of the information society, made a critical rethinking of their predecessors' concepts, who worked on the concepts of post-industrial and information societies in the 1960s – 1980s. Castells believes that information has played a key role in socio-economic development in the past, so it would not be quite right to characterize modern society as information society, but it would rather to characterize it as an era in which information and communication technologies form new network structures. The revolution of information technology, according to M. Castells, has also led to the emergence of a new form of existence of society – a network society characterized by globalization of economic activity, network organization, flexibility and individualization of labor.

Of course, as M. Castells (2000) rightly points out, networks and information cannot be called a phenomenon of the society of the XXI century, because they existed before, but it is in modern society that information and network structures acquired a completely different role, which allowed them to dominate in a number of spheres of social life. In modern society, there is a plexus of networks and information and communication technologies, which together form a new social structure, fundamentally different from the previous models of organization and functioning of society.

Another consequence of the technological revolution and Informatization of society was the transformation of various social institutions and processes, including the socialization of younger generations. First, transformational changes affected the most important institution of the family for society. Although the value of the family is undeniable in modern society, this institution has undergone the most extensive changes.

In the modern information society, traditional institutions of socialization (family, education system, etc.) are weakening their positions. This is especially true of post-Communist and post-Soviet societies that have undergone a systemic transformation. In the process of transformation, the institutions of formal socialization lose their functional effectiveness especially quickly. The rapid development of information and communication technologies, the computerization of everyday life, the emergence and widespread use of youth subcultures and counterculture led to the birth of intersubjective consciousness, in which the other person was seen as something no less reliable than his own "I" (Khaziyeva & Klyushina, 2014). The crisis of socialization was also a consequence of the crisis of self-identification, as the former structures responsible for the socialization of the individual no longer satisfied the identification and communicative needs of modern man.

This situation was determined not only by the emergence of information and communication technologies, but also by numerous other economic and social factors inherent in the modern world. The younger generation has lost distinct guidelines and meanings, or rather – was faced with a rather difficult prospect of the need for their independent search and in this search the older were no longer, as before, reliable and experienced advisers (Kirdyashkin, 2018). Their place was taken by the Internet - it is in the interactive space that young people today draw the bulk of their knowledge, and not only carries out virtual communication.

At the same time, the modern sociological discourse has formed an ambiguous attitude to the transformation of the Internet and social networks into an actual institution of youth socialization. Trying to follow *in step with the times*, Western researchers in large part not critically enough perceive the fact of *digital* socialization, focusing on the democratic nature of the Internet in General and social networking in particular, and decentralization as the key advantage, enabling adolescents and young people to be themselves and to communicate with loved ones in the mental aspect (Awan & Gauntlett, 2013). From this point of view, Internet communication has a stronger impact on the formation of new social relations in modern society, which can result in leisure communication, as well as in some social and political actions (Diani & Mcadam, 2003).

Modern youth, if we turn to the generational theory of W. Strauss and N. Howe and W. Strauss (1991), developed in relation to the United States, but has the ability to project on the Russian reality, refers to two generations – generation Y (the so-called "Millennials", or the Millennium generation), whose representatives were born during the 1980s – the first half of the 1990s, and generation Z, whose representatives were born in the late 1990s-the first decades of the XXI century (Howe & Strauss, 1991).

Features of socialization of modern youth is that their maturation is already fully in the information age, in the age of digital technology. Modern young man cannot imagine life without the Internet, gadgets, and digital technologies. The Internet, including virtual networks, is beginning to play an increasingly important role not only in the daily life, studies, work and leisure of today's young people, but also in their socialization.

Recently, new concepts of *digital generation* have appeared. Thus, American researcher gene Twenge introduces the concept of *generation iGen* (internet generation) (Pichugina, 2019). The Internet generation includes people born between 1995 and 2012. The formation of this generation took place in the era of the total spread of gadgets, digital technologies and social networks of the Internet. They cannot imagine life outside of digital technologies. Gadgets are becoming increasingly influential in the lifestyle of this generation, with the help of which young people and teenagers go online, communicating with their own kind and getting access to the content they are interested in. It is through the prism of virtual reality that the network generation "perceives and constructs the real world, the future of which, as an information world, is largely determined by the value and behavioral attitudes of the network generation generated by it" (Krasnorutsky, 2017).

Results

The second approach, related primarily to the sociology of P. Bourdieu (2002), is characterized by the analysis of social networks from the perspective of social capital accumulation. As L. Voropai (2018) notes, in sociology of P. Bourdieu (2002) there is a close relationship between the concepts of social capital, socialization and habitus: "Habitus is a product of socialization process and includes learned and reproduced by the individual (*agent* in Bourdieu's terminology) ways of perception, thinking and action, which are also socially marked and determined". At the same time, the habitus in the conceptual system of P. Bourdieu is a form of cultural capital incorporated by the individual in the course of socialization, which mainly determines the career potential and overall social success of a person.

Widely using the concept of capital borrowed from Marxism, P. Bourdieu (2002) considered social capital as a set of resources and opportunities possessed by the individual due to its integration into certain social networks and groups. Influenced by Marxist tradition, Bourdieu understood social capital as a social relation, emphasizing the relationship between social relations and economic capital. Social capital can materialize in real forms, turn into real economic capital. At the same time, Bourdieu introduced an innovative moment in the traditional ideas about capital, highlighting its various types that can be converted into each other, which allowed "more accurately and nuanced to describe and conceptualize the complex system of social interactions and relations of power that has developed in the transition from industrial to post-industrial society" (Voropai, 2018).

Thus, considering economic capital as only one of the forms of capital, he allocates along with it cultural and symbolic. Moreover, if by economic capital Bourdieu understands the economic resources available to the agent, -money and property, - then the cultural capital is education, knowledge, manners, skills obtained by the agent because of socialization and habitualized his social group.

In direct connection with cultural capital and in relation to mutual conversion with it is social capital – obtained through birth or acquired connections, which largely determine the social position of the agent and his career opportunities. Thus, according to the concept of P. Bourdieu, the formation of the personality of an individual agent through the assimilation of habitus and socialization is to acquire social and cultural capital.

From this point of view, the influence of social networks on the process of socialization of the younger generation, as it seems to us, is legitimate to consider on the basis of the methodology of P. Bourdieu (2002) as additional opportunities for the acquisition of social (in the form of connections) and cultural (in the form of skills and knowledge competencies) capital.

In turn, the well-known representative of the theory of rational choice J.C. Coleman (2004) gave rise to a different conceptual line of analysis of social capital, considering the latter not as an attitude that produces things, but as a *thing*, that is the source of relations. It is the relationship of individuals among themselves, based on trust and partnership, become, as emphasized by J. J.C. Coleman (2004), the social capital that, like glue, cements society.

R. Putnam (1993) emphasizes that social capital has the features of social organization – trust, norms and networks that contribute to the effectiveness of social communication and improve coordination of actions (Putnam, 1993).

F. Fukuyama (1999) also defines social capital as "an opportunity arising from the existence of trust in society". Accordingly, at the individual level, social capital is understood, first, as a resource of the individual, allowing him to use the common (collective) resource of the community. At the same time, social capital can have a group, not an individual character, being a resource of some community of individuals-organizations, enterprises, parties, etc. (Macerinskiene, Minkute-Henrickson & Simanaviciene, 2009).

These additional facets of the interpretation of the concept *social capital* allow us to see the impact of social networks and as the formation of public trust, the assimilation of social norms.

The main features of social capital include flexibility, durability, reliability, the ability to produce other forms of capital and to invest (Robison, Schmid & Siles, 2002), although, of course, if you apply the concept of social capital to reality, these criteria do not work in all cases. Social capital opens up the possibility for an individual to use resources, including economic resources, of the Association or network to which he or she belongs or with which he or she has a trust relationship. If in the traditional sense it can be a family, clan, genus, ethnic Diaspora, in the modern information society virtual communication is becoming increasingly important. Accordingly, social ties and relationships are also settled in the virtual space.

Discussion

Modern sociology is rapidly developing a new paradigm-social riskology. Considering social phenomena and processes from the point of view of their ability to generate risks and in close connection with the ability of society to reflexively understand the riskiness of certain factors, researchers in this area pay attention, first of all, to the negative, risky consequences of the impact of social networks on socialization - and for the younger generations themselves, and for society as a whole. They associate the use of the

Internet with a number of social and psychological risks. Among the psychological risks is the Internet addiction associated with a sense of euphoria from being online (Beard, 2011), the emotional need for constant online presence and the replacement of real social connections with virtual ones (Varlamova, Goncharova & Sokolova, 2015).

B. Zizek (2017), formulating his critical concept of socialization in social networks, argues that many network platforms do not satisfy the need of young people in development, encouraging them to abandon existing social relations, replacing them with a focus exclusively on virtual reality. The leading role in the socialization of young people is played by *strong ties*, which are characteristic of the real, not the virtual world. Thanks to *strong ties,* relations between people deepen, developing into more frequent and close interaction. Online space is a territory of *weak ties*, which are fleeting and changeable, and from their rupture or establishment of new ties a teenager or a young person loses or acquires little.

Speaking about the risks of cyber socialization, modern researchers at the same time note the existence of different strategies and approaches to the use of the Internet in General and social networks in particular in certain groups of young people.

For example, J. Smith, B. Hewitt and Z. Skrbiš (2015), summarizing the sociological research conducted in Australia, concludes that young people who were brought up with limited access to Internet resources, perceived network technologies primarily as a tool to improve the quality of their studies or work. The Internet provides more productive opportunities for academic and other research than other, more traditional ways of doing intellectual work.

With cyber socialization, many modern researchers also associate the spread of aggressive behavior towards others or themselves among young people and adolescents (Boldakova, 2015); obtaining unsystematic and carrying numerous risks information of extremist, pornographic, suicidal content; with de-socialization they associate the *dropping* out of social reality and, as a consequence, the spread of alcoholism, drug addiction, and other forms of deviant behavior among *cyber-dependent* young people (Rostovtseva, Mashanov & Khokhrina, 2013).

In addition, the Internet, according to the separation theory put forward By L. Henderson, P. Zimbardo and J. Graham (2002), acting as a catalyst for communication and a tool for increasing communication activity, is also able to reduce social activity in real space. For example, S. Lee (2009) emphasizes that young people in the process of cyber socialization have a kind of shift; they begin to communicate less with real friends, relatives, family members, as their communication priorities are shifted to the virtual space.

The researchers note that *changing* the direction of the young man to virtual communication entails a high probability of difficulties in real social communication (Komarova, 2018), the young man can turn into a kind of modern recluse (for example, Japanese *Hickey* (Baeva, 2018), seeking to reduce contacts in the real social space to a minimum. Thus, the consideration of the impact of social networks on the socialization of young people in the perspective of social riskology focuses on the identification of numerous social, psychological and socialization risks. At the same time, the greatest number of risks are faced by representatives of the generation of *digital aborigines*, whose childhood has already fallen on the era of the universal spread of digital technologies.

In this regard, the modern sociological science has widely adopted the approach of increasing the controllability and manageability of the activity of adolescents and young people on the Internet, which would protect the younger generation from the many risks of interactive communication and would focus on the development of constructive ways and purposes of using the benefits of the Internet.

Conclusion

The study of the problems associated with the socialization of young people in the global information and communication space requires the involvement of several methodological approaches presented in modern theoretical sociology.

The corpus of such approaches includes:

– The theory of the information society, especially the theory of the global network of M. Castells (2002), which clearly emphasizes the qualitative difference between the modern type of culture and sociality, due to the specifics of Internet technologies. These theories make it possible to realize that in the modern world a type of culture has been formed in which the material and symbolic parameters of the individual's life are completely immersed in network communication, and this radically changes the modern man in the specifics of his social connections and interactions;

– theories of social capital, which go back to the sociology of P. Bourdieu and give the opportunity to consider the impact of social networks on the socialization of young people in terms of the accumulation of virtual and real social relations, specific skills of network communication, competencies acquired in social networks;
– the concept of social riskology developed in the theories of *risk society* that provides the paradigm of vision of the network communication processes from the viewpoint of produced by them, socialization risks associated with the formation of deviant trajectories of socialization, the stream and securing the youth behavioral deviance, deficiency of the interiorization of social values.

These methodological approaches can be used comprehensively, despite their different paradigmatic affiliation, since the tasks arising from the purpose of the study focus on the analysis of socialization risks generated by the involvement of individuals in a qualitatively updated environment of socialization, formed by modern information network society.

The breakthrough in the field of digital technologies that characterizes modern society has contributed to a radical change in social reality in the direction of the formation of a global information and communication space, the economic, cultural and symbolic dimensions of which are constituted by cross-border network connections. A significant component of this Constitution constitute the social Internet network, which is the most widespread form of involving young people in information and communicative interaction.

The expanding influence of network communication on the personal formation of young people and adolescents involved in it gives grounds to see an informal agent of socialization in social Internet networks, able to effectively compete with traditional socializing institutions. This potential is largely due to the multi-functionality of social Internet networks, which combine the performance of information, communication, identification, recreational functions, which provides a high attractiveness for young people of social networks as an institution capable of satisfying a wide range of requests and needs.

In Russian society, as in all post-Soviet societies that have gone through systemic transformations, traditional socializing institutions have been functioning for a long time with insufficient efficiency, which was caused by the introduction of new foreign cultural values on the Russian soil and into the basis of socialization. At present, the impact of this dysfunctionality of socialization institutions remains and the socializing influence of Internet networks actually fills the deficit of the effectiveness of targeted institutional socialization in relation to the age categories of young people born in the mid-1990s, which corresponds to the *generation* Z in the classification of M. Prensky.

This complex includes the theories of the information society and the theory of the global network of M. Castells (2002), which make it possible to consider social networks in the broad context of global cultural, symbolic and social changes of our time; the theory of social capital of P. Bourdieu, which allows to assess the impact of social Internet networks on the process of socialization in terms of mastering by young people the skills, qualities and connections that have a positive potential for further building life strategies and the formation of values and normative attitudes; theories included in the paradigm of social riskology, allowing to identify and assess the socialization risks produced by the influence of social Internet networks.

Abstract

High requirements to information transfer are on the one hand the reason, and with another the driver of active growth and transformation of the market of services of the Russian telecom operators, complementing and expanding the range of traditional and generating new offers. Active promotion of new opportunities by leading Russian telecom operators improves the quality of services for the transfer of various types of data in digital format. Consumers who actively participate in the selection of the optimal individual set of communication services and prefer to save money from their personal budget have a significant impact. These points determine the purpose of the study - to assess the impact of market conditions on the strategy of promoting the services of Russian telecom operators. For the analysis of the existing problem, theoretical and empirical methods, methods of quantitative and qualitative analysis, methods of data aggregation, expert evaluation, classification and structuring of information, reference and statistical data, comparison method were used. As a result of the study, the factors determining the development of telecom operator services on the Russian market were structured. The development strategies of cellular communication companies have been assessed and features of the promotion of mobile operators have been highlighted. The obtained data were used to compile a rating of cellular operators in Russia. The materials of the article can be used in the work of specialists dealing with the promotion of services of Russian telecom operators.

Keywords: service prediction, cellular communication, development strategy, services, telecom operators.

Introduction

There are 4.92 billion mobile users in the world, which is 66% of the total population. (Digital in 2017 Global Overview report from We Are Social and Hootsuite, 2017). The market of telecommunication services in many countries tends to expand and intensify competition from national and international telecom operators, as well as operating in conditions of instability in the development of customer preferences, what has a direct impact on economic results and efficiency of use of resources in the course of rendering telecommunication services (Filatov et al., 2015). The market of mobile communication services refers to high-tech markets. According to a study by BDRC Continental consulting company and the British provider Cable.co.uk, Russia in 2018 was among the leaders of the countries with the most accessible Internet (4th place) (Worldwide Broadband Price Comparison, 2018).

As it is noted in the work (Zhuravleva & Slobodkin, 2006), an important factor in the development of the telecommunications industry is the successful and dynamic development of the Russian economy.

Articles (Dudarenko, 2011; Kurasov, 2010) showed that the introduction of 4G networks into industry practice improved the quality of mobile communications, increased data transfer speed, increased operators' profits, and significantly reduced the costs of mobile communications and the Internet.

In the dissertation research by V.V. Alekseeva (2007) analyzes scientific and theoretical approaches to the study of marketing strategies to increase the competitiveness of Russian cellular companies, study methodical approaches to the development of marketing strategies of Russian mobile communications companies in the regional market in the telecommunications sector, on the basis of which the author developed a methodology for assessing the competitiveness of cellular enterprises. in telecommunications. In a study by E.A. Vasilyeva (2010) the structure, problems and prospects for the development of the telecommunications services market, and developed methods for ensuring the competitiveness of cellular communications enterprises in a saturated market are studied. In the study of B.N. Asekova (2004) the organizational and economic basis for improving the quality of cellular services on the Russian market in the face of increasing competition are developed. One of the key points in the development of cellular operators' services is the systematization of approaches to identifying achievement measures, the organization's goals, types and criteria for the manifestation of applied promotion strategies in a telecom operator, which determines the relevance of the research topic.

Methodological framework

The methodological basis of this study was the scientific research of Russian and foreign researchers (Shake & Sutton, 1984; Pishchin, 2009; Zhuravleva & Slobodkin, 2006; Dudarenko, 2011; Kurasov, 2010; Rozanova & Bulychenko, 2011; Matyushkina & Ponomareva, 2016; Pakhomova, 2018) and others who were engaged in the research of the services market telecom operators, as well as the results of analytical agencies and research consulting companies.

To study the impact of market conditions on the strategy of promoting the services of Russian telecom operators, theoretical and empirical methods, methods of quantitative and qualitative analysis, methods of data aggregation, expert assessment, classification and structuring of information, reference and statistical data, comparison method were used.

Results and Discussion

The main factors influencing market conditions on the strategy of promoting the services of Russian telecom operators.

According to the results of empirical research (data from the TMT Consulting analytical agency, Fig. 1), the telecommunications market in Russia annually shows an increase in sales of services, the highest growth rate observed in 2018, compared with 2017.

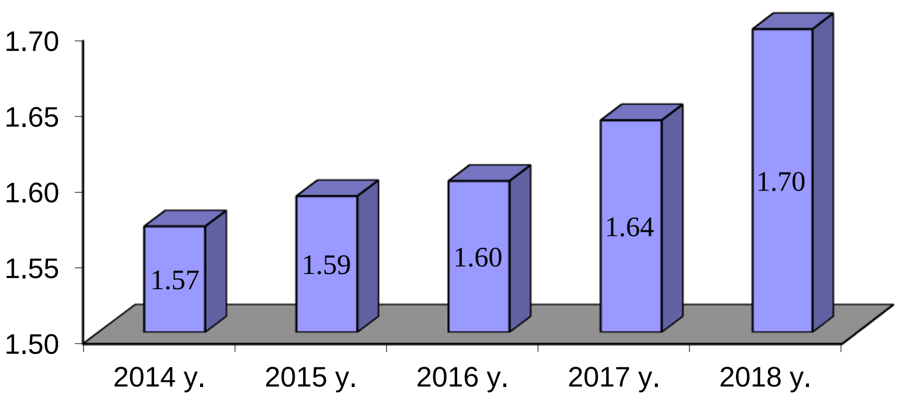

Figure 1. Telecommunications market in Russia in 2014-2018, trillion rubles (The telecommunications market in 2018 received a record growth over the past 5 years, 2018).

In general, the volume of the telecommunications market increased from 1.57 trillion rubles in 2014 to 1.7 trillion rubles in 2018.

The rapid growth of the telecommunications industry in Russia is characterized by the following trends:

– increase of entrance barriers (cost of equipment and software for mobile communication),
– tough competition in the mobile market,
– reduced competition from traditional means of communication (wire telephony, radio communication).

According to some authors, for the telecommunications industry it is necessary to use the network model of the market when the number of participants is determined and on which there is a high differentiation of the products and services offered, and refers to the network oligopoly (Rozanova & Bulichenko, 2011). This model of product differentiation, where each product can be characterized through a set of properties was developed by British economists (Shake & Sutton, 1984).

Traditionally, foreign authors believe that the telecommunications industry is characterized by monopolistic competition or oligopolies (Parker & Röller, 1997; Valletti, 1999; Valletti & Cave, 1998; Stole, 1995).

In assessing the telecommunications market in Russia, the Herfindahl-Hirschman Index (I_{HH}) was used, which helps to determine the degree of market concentration based on the share of each market participant in the industry.

$I_{HH} = \sum_{i=1}^{n} S_i^2$,

where Si is the share of the i-th operator in the total volume of services of the cellular communication market, n is the number of operators.

Interpretation criteria for the result: that the greater the proportion of enterprises in the industry is, the greater the likelihood of a monopoly is, and the level of the Herfindahl-Hirschman index above 1800 indicates a highly monopolized or oligopolized industry.

For Russia, I_{HH} = 2449, which indicates a very high degree of concentration of the cellular communications market, that is, its oligopolistic character.

As noted above, the market for services of cellular operators belongs to high-tech markets, therefore, as noted by O.N Pishchin (2009), innovations are the basis for increasing the profit and competitiveness of cellular communication service companies.

Improving the quality of telecommunications services leads to higher prices for tariff plans (Harno, 2010). In this regard, cellular companies are forced to do their best to optimize tariffs, manage pricing and develop strategies to promote the services of Russian operators.

According to the results of the materials' research of existing scientific research on the development of telecommunication services in general, and services of mobile operators, both in the Russian Federation (Fiseysky, 2008; Kobylko, 2009) and abroad (Choi, Lee & Chung, 2001; Corrocher & Zirulia, 2009), conducted by the authors of the article, identified and grouped the main groups of factors determining the development of cellular communications of Russian operators (Table 1).

Table 1. The main factors determining the development of services of telecom operators on the Russian market

Factors	Content
1) Growth of mobile subscribers in the regions	Qualitative indicators of the growth of telecommunications services are accompanied by a disproportionate growth rate of the subscriber base in the regions.
2) Consolidation of assets of mobile operators	The growth in the number of subscribers is accompanied by the consolidation of the assets of large operators through the absorption of small ones in strategically important regions.
3) Reduction of tariffs and the growth of data traffic in mobile services	The main share of telecommunication services falls on the GSM standard (79 regions of Russia with the number of subscribers over 139 million).

4) Providing an integrated package of telecommunication services	The growth in the number of subscribers is accompanied by the expansion of the service package: mobile communication, access to the satellite television program package and access to the mobile Internet, access to mobile applications and electronic services, access through social networks content through special applications.

With the development of 4G / 5G / 6G technology in Russia, operators' pricing strategies transform the structure of the services provided, adding access to the package of satellite television programs and access to the mobile Internet to the package of services, and the emphasis on the promotion of services is changing.

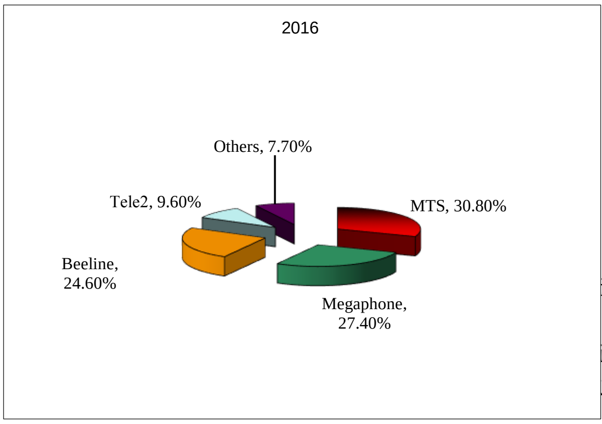
According to the results of the study, it is possible to identify such features of the market of services of mobile operators, such as:

- oligopolistic character, high degree of concentration of the cellular communication market,
- competition of strong brands in the market;
- the high rate of technological change of the “leading four” towards the formation of 5G / 6G networks in Russia.

3.1. Investigation of Strategies for the Promotion of Mobile Operators’ Services

Cellular services today are the most profitable and rapidly growing segment of the telecommunications market.

The market research shows the sustainable development of the four main companies MTS-31%, Megaphone - 29%, Beeline (PJSC “Vimpelcom”) - 23% and Tele2 - 16%, which already in 2017 accounted for 99% of the entire market and this trend continued and in 2018.



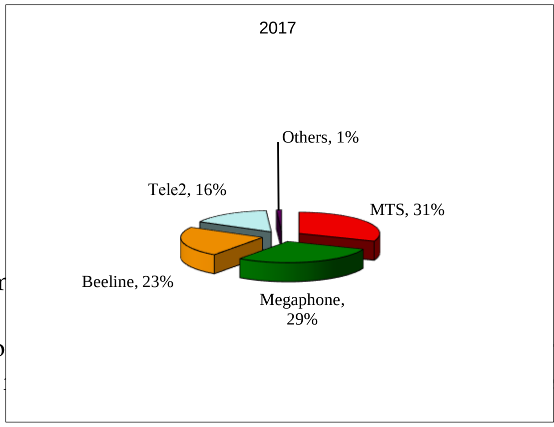


Table 2. Key financial indicators of mobile operators (Market shares and key financial indicators of mobile operators in 2017, 2018)

Indicators	MTS	Megaphone	Beeline	Tele2
Revenue billion rubles.	442,9	321,8	327,5	123
Net profit billion rubles.	56	20,52	7,6	-5,5
Change in revenue compared to 2016, %	1,7	1,8	19,8	16,2
Change in net profit / loss	15,6	-29	-63,2	64,6

compared to 2016, %				

Of a particular interest is a quantitative study of the formation of pricing policies for the provided mobile communication services by market participants.

Until 2017, the main method of competition between operators was price reduction. But the decline in the revenue in 2016 led to a revision of the promotion strategies, and a tacit agreement on “reconciliation” was made by the mobile communication companies. Operators have moved from dumping policy to a strategy aimed at retaining subscribers. This strategy had a positive impact on the mobile communications market. So, for example, in the 3rd quarter of 2017, revenue growth was observed, whereas for the same period of 2016, the revenue growth rate was negative.

A study of the telecommunications market allowed compiling a rating of major companies.

Table 3. Rating of cellular operators in Russia for 2018

Operators	Percentage of voice connection failures and breaks during a conversation, %	Number of not received SMS, %	Average speed of the mobile Internet, (Mbps)	4G coverage in Moscow and Moscow Region,%	Budget Tariff Plans	Favorable tariff plans
MTS	0,8	2,4	10,1	30,9	«SMART»	"SMART Overseas"
Megaphone	0,7	1,7	13,1	32,2	“Turn on! Write"	“Turn on! Communicate
Beeline	15,1	0,0	5,0	28,8	"All for 350"	"All for 600"
Tele2	1,2	1,2	9,4	8,3	"My conversation"	«My Tele2»

* developed by the authors, based on expert estimates of RosKomNadzor

As you can see, Megaphone provides Internet services of 13.1 Mbit / s, whereas Beeline (PJSC “VimpelCom”) - 5.0 Mbit / s, but at the same time Megaphone has the largest number of failures when connecting to IP / TCP and http. Independent analysts at ComNews Research estimate that, on average, Russian subscribers have to pay 350 rubles for a minimal set of cellular services per month.

For communication within the region, the MTS operator has become the cheapest. and if we talk about affordable communication throughout Russia, Tele2 is leading here.

Evaluation of strategies for the development and promotion of services companies identified the following:

1) MTS continues to adhere to the policy of diversifying its business being an innovator in the field of digital, the strategy of the company “3D: Data. Digital. Dividends. In 2018, MTS began to actively develop online services in preparation for passing the EGE. The company entered the distance education market by launching the Smart University platform. With this service you can prepare for the exam in English, in the future it will be replenished with other subjects. Popularization and promotion of a wide range of services, as well as the development of innovations with the aim of improving the quality of life of subscribers and their security, is the basis of the company's development strategy. Therefore, in marketing communications, the company concentrates on working with existing customers and follows a strategy of increasing loyalty through subscriber engagement. For this, combinations of different formats are used, for example, increasing

brand loyalty through the involvement of each person in the value of the MTS brand or is illustrated by examples of how entire industries work and develop together with MTS products.

2) Megaphone continues to actively cooperate with the technology company Mail.Ru Group, which owns the VKontakte, Odnoklassniki social networks, ICQ and TamTam, instant messengers, as well as the Yula mobile ad free service and Deliver Slub food delivery platform. However, in May last year, Megaphone changed the company's development strategy until 2020. Changes were made to the dividend policy and the size of the optimal debt load ratio, as well as the differentiation of Megaphone, Yota and VKMobile brands. In 2018, the company launched a program for quick fare payment in public transport, and in November became an investor and co-owner of the taxi service “Citimobil”, which works as a mobile application to continue active promotion of the service in its own and external communication channels. As well as digital promotion to familiarize users with the service, support and promotion of product offers - development of service processes and sales of new products in contact centers and on self-service channels. The development strategy of Megaphone notes that the company's focus will be to “attract digital customers” and transfer existing users to this category, while increasing the number of customer services in order to increase revenue from them by 2–5% annually. ” (Megaphone presented a development strategy until 2020, 2017)

3) According to customer estimates and expert reviews, Tele2 was recognized as the best operator by the cost of services for the majority of users who are interested in the Internet, calls and messages. Until 2016, Tele2 developed as a discounter, focusing on the lowest price. But in the future, a new business strategy was developed, called the Lifestyle enabler (“assistant in maintaining a lifestyle”). And this model began to imply for Tele2 the offer of the best service at the best price. After such strategic changes, in the beginning of 2017, a new communication strategy was presented until 2021 with the slogan “Tele2. Other rules”. Part of the brand’s advertising campaign is based on opposing itself to other operators, in particular the “Big Three”

4) Beeline is more focused on television advertising and promotion of its products, offering its customers a service such as exchanging minutes for gigabytes.

The calculation of internal and general competitiveness for each cellular operator has a high information value (table 4.). Analysis of the competitiveness of enterprises of communication services was carried out on the basis of expert assessments of factors. Experts here are three experienced users of communication services, who use a five-point scale to assess competitive advantages (Filatov & Kovalenko, 2012).

Table 4. Competitiveness of the largest mobile operators

Competitiveness levels	MTS	Megaphone	Beeline	Tele2	Perfect value
Market share	0, 31	0, 29	0, 24	0, 1	0, 65
Internal competitiveness	0, 398	0, 393	0, 221	0, 252	0, 707
Overall competitiveness	0, 041	0, 038	0, 017	0, 008	0, 153
Relative internal competitiveness Megaphone	0, 987	-	1, 775	1, 559	0, 555
Relative overall competitiveness Megaphone,%	92	-	223	475	24

* developed by the authors, based on expert estimates of RosKomNadzor

The assessment shows that MTS and Megaphone are leading in this market, and Beeline and Tele2 are moving more and more into local markets.

Thus, according to the results of the study, we can conclude that the market for cellular services in Russia is in its saturation stage, which requires a focus on servicing corporate customers and sharpens competition, increasing service levels and quality of service, and ensuring the loyalty of existing customers.

The leading companies in the cellular market in Russia adhere to various strategies, but the dominant one is the differentiation strategy and branding strategy to promote services, the goal of which is to attract new customers, retain subscriber bases, develop long-term customer relationships, and increase customer loyalty.

Conclusion

Based on the results of the study, it can be concluded that the economic situation in the market of services of Russian telecom operators is characterized by a high level of competition, a high degree of concentration and high rates of technological innovations. The growth in the number of subscribers is accompanied by the consolidation of the assets of large operators through the absorption of small ones in strategically important regions and the expansion of the package of services. The ongoing changes in the market for mobile services lead to a change in the strategies for the promotion of telecom operators. Since the growth of the cellular services market has slowed in recent years, operators have associated an increase in sales volumes with the development of “digital clients”, subscribers who monthly consume a large amount of mobile Internet traffic, use mobile applications, communicate in instant messengers, and use the telephone to pay goods and services. If until 2017, the main method of competition between operators was dumping wars, from 2017 there has been an emphasis on promotion strategies for retaining subscribers and developing long-term customer relationships, developing customer loyalty, concentrating on serving corporate customers and improving service levels and quality of service.

Abstract

The relevance of the research topic is determined by the high growth of the telecommunications services market's rates throughout the world, by the spread of its area of influence in related areas, displacing traditional types and forms of service provision. In the face of increasing competition for consumers, operators of the telecommunications services market are increasingly paying attention to the issues of improving tariff policy. In this regard, the purpose of this article is to identify and assess the main trends in the development of the tariff policy of the operators of the telecommunications services market. The study was conducted on the example of Russian companies. The leading methods in the study of this problem were the methods of theoretical and empirical methods, the method of consolidation and generalization of the results of the research, the methods of expert evaluation and complex analysis of problems, the method of preference vectors. The article assesses the state and prospects of development of the Russian telecommunications market, substantiates the most significant factors influencing the tariff and service policies of operators of the Russian telecommunications services market, identifies the main trends in the development of the Russian telecommunications services market. The materials of the article can be used not only by Russian, but also by other operators, operators of the telecommunications services market in emerging markets in determining ways to improve their tariff policy.

Keywords: telecommunication services, competitiveness of telecommunication services, efficiency of sales of telecommunication services.

Introduction

Since 2010, there has been an increase in the number of dissertations and scientific publications devoted to the development of telecommunications services in general, and cellular communications in particular. The main surge of interest in this problem was noted in the studies of Russian scientists in 2010–2012 (Vasilyeva, 2010; Oshanin, 2010; Mityaeva, 2012). In addition, many Russian scientists investigated the competitiveness of these services, including by improving the tariff policy of telecommunications services operators (Lukashova & Losev, 2012; Agalarova & Borisova, 2016; Bekher & Fedotova, 2016; Kaminsky & Lukashova, 2016). At the same time, this market is developing so rapidly that it is necessary to constantly update the research results to take into account all new factors and trends that influence the development of the Russian telecommunications services market.

In the context of the innovative development of telecommunications on both the Russian and international markets, the possibility of extensive growth of companies providing mobile communication services is decreasing. To maintain their position (or expand their business), to ensure the stability of the financial performance of companies operating in the telecommunications market, they are faced with the need to expand and diversify the services provided (Filatov & Kovalenko, 2012). From this point of view, a comprehensive study of the functioning of the provider of mobile communication services, as well as analysis of the main trends and tariff plans of Russian operators in the telecommunications services market, becomes extremely relevant.

The largest segment of this market with a share of 52% is mobile communications. In the period up to 2021, it will grow by 2% per year due to an increase in the volume of mobile traffic and the increasing distribution of M2M services. In second place is a fixed line, providing 21% of the total market volume. Due to the growing demand for high-speed communications, this segment will grow by 4% per year until 2021.

The pay-TV segment, which includes cable, satellite, IP and digital terrestrial TV, may stop its growth, while the fixed telephony market volume will decline by 6% annually and by 2021 will occupy only 10% of the telecom and TV services market.

According to the preliminary data from TMT Consulting, the Russian telecommunications market in 2017 grew by 1.3% compared with 2016 and reached $ 1.62 trillion rubles. The mobile segment increased by 1.5%, and the segment of Internet access - by 3.8%. Unlike the world market, the segment of pay-TV is still actively developing in Russia - in 2017 it increased by 10.5%. At the same time, the fixed telephony segment showed a decline of 9%, and inter-operator services - by 7%. The overall positive dynamics of the market as a whole is due to a small share of these segments in the total market volume - about 17% (Russian telecom is still growing slower than the world, 2018).

If we talk about the number of subscribers, in the mobile segment their number increased by 1.7% compared with 2016 and reached 260 million, in the segment of broadband Internet access - by 3.7% to 34 million, pay television - by 3.4% to 42.6 million, while in the fixed telephony segment it decreased by 10.5% to 28.4 million. Thus, in 2017, the penetration rate of fixed telephony fell to 38%.

As for forecasts for the next 5 years, according to analysts of TMT Consulting, the Russian telecommunications market will grow by more than 1% per year, provided that there is no new round of price competition from mobile operators, the implementation of the Digital Economy program and the development of the Internet things based on 5G networks.

At the same time, the telecommunications services market itself is developing so rapidly that completely new trends are emerging, the leaders of the segments of this market, as well as consumer preferences, are changing. Therefore, there is a need for continuous research on the main trends and tariff plans of Russian operators in the telecommunications services market.

Methodological framework

To carry out this study, the authors of the article used the methods of theoretical and empirical methods, the method of consolidation and generalization of the research results, the methods of expert evaluation and complex analysis of problems, the method of preference vectors.

The methodological basis of this study was the scientific studies of Russian and foreign researchers engaged in the research of the telecommunications services market.

The methodological basis for the study of the economics of companies operating in the telecommunications services market was the work of foreign authors such as (Birke & Swann, 2006; Doganoglu & Grzybowski, 2007; Grzybowski, 2005; Dunnewijk & Hultern, 2007; Koski & Kretschmer, 2005), as well as the works of russian researchers (Matveeva, 2006; Bolodurina & Ogurtsova, 2012; Pakhomova & Preobrazhensky, 2015; Labazanova, 2015; Makarov & Sinitsa, 2017), and others.

Results

3.1. Assessment of the State and Development Prospects of the Russian Telecommunications Market

The volume of the telecommunications market in 2018 reached 1.70 trillion rubles. The growth rate of income was 3.4%, this is the highest dynamics in the last 5 years. Growth was mainly due to the accelerated revenue from mobile communications, showing an increase in revenues for the second year in a row. In addition, the growth rates of broadband access and pay TV markets remained stable. Fixed telephony and inter-operator services continued to decline, but their negative dynamics slowed down somewhat, in addition, their contribution to the total revenue of the industry and the impact on its development rates is decreasing annually. The steady decline in the fixed telephony market is due to the failure of subscribers from this service in favor of mobile communications. The inter-operator market is shrinking in the context of low new demand and lower prices in selected international areas (Filatov et al., 2015).

The dynamics of the mobile market was favorably affected by the initiative of operators in 2017 to “repair the market”, which included the rejection of price competition, the abolition of unlimited tariffs and an increase in the supply of basic and additional services. Despite the new intensification of competition in many regions of the country and the return of no-limit, the positive effect of the initiatives was felt throughout 2018. In addition, significant growth was observed in the segment of corporate clients, primarily due to an increase in revenue from SMS mailings, M2M and other additional services.

As a result, in 2018, the trend to increase the average revenue per subscriber, formed a year earlier, was preserved not only by successfully selling services based on its new 4G / 5G Tele2 network, but also by the Big Three operators. In a saturated market, operators switch from the race for a new subscriber to serving the existing customer base, and we can expect a further reduction in the number of users in subsequent years. This is due to the increase in tariffs carried out by some operators, the growth in the consumption of additional services (VoD, multiroom, deferred viewing, etc.), as well as the change in the accounting methods for revenue by individual players.

A study of the telecommunications services market has led to the conclusion that in 2019, operators may face a number of new challenges. This is due to the fact that the largest segments of the market have reached saturation, in addition, the negative impact of unlimited tariffs will appear in mobile communications, and further intensification of competitive struggle is also possible. Also, operators will not only maintain a high growth rate of the segment of additional services in the mobile B2B market.

It can be assumed with a high degree of confidence that the increase in ARPU will in most cases be achieved in 2019 due to the traditional formula for the industry - more services for big money, that is, customers will be offered more traffic and services to meet their growing needs, primarily in Internet services. Under these conditions, we can expect the market to maintain positive dynamics in the medium term at a level of 2-3% per year. However, the reality of these prospects is affected by a large number of factors and trends existing in this market.

3.2. The Most Significant Factors Influencing the Tariff and Service Policies of the Operators of the Russian Telecommunications Services Market

In general, according to the results of the analysis of data on the development of the telecommunication services market in the Russian Federation, it should be noted that 2018 was the year of the recovery of the Russian mobile communications market after falling over the period 2014-2017 (The Russian cellular market is slowly recovering, 2018). Nevertheless, in the medium term, the market situation retains a negative potential. So, regardless of the market strategy and the dynamics of real wages of the population, pricing in the market with four federal players obviously implies lower margins compared to the previously established oligopolies of the “triplet”. Probably, the first consequences of the aggravated competition have already appeared in the 4th quarter of 2017 and in this respect caused the greatest damage to the margin of Megaphone, as it can be seen from the data in Table 1.

Table 1. The influence of factors on the dynamics of mobile service revenue and margin OIBDA mobile operators in Russia

№	Factor	Nature of influence
1	Dynamics of real wages	In the conditions of a long and significant decline in real wages, Russian households have shown a previously uncharacteristic tendency for them to save on communication services. According to Rosstat, from 2013 to 2017, the share of the corresponding household expenditures decreased by 2% to 3.3%. Consumers switched to cheaper rates and refused from additional SIM-cards.
2	Ruble's	A large share of operating expenses of mobile operators is historically tied to the

№	Factor	Nature of influence
	exchange rate.	dollar rate. In addition, the weakening of the national currency reduces revenues from foreign roaming amid falling foreign tourist traffic, as well as other categories of VAS revenues.
3	Increased competition.	The launch of Tele2 at the key Moscow region for Russian operators had a negative impact on pricing. In fact, the oligopolistic model of competition of the "triple" has made a big step towards monopolistic competition. Combined with the fall in real wages that had intensified by then and the weakening of the ruble, companies in the sector showed a record simultaneous drop in margins.
4	Attempts to diversify.	Reducing margins and strengthening state regulation naturally led to lower profitability of investments. In the mobile market, a trend towards diversification took shape (Megaphone's purchase of control at Mail.ru Group, MTS investment in Ozon and system integration, the development of VEON's own Internet platform). In some cases, M & A transactions strongly unbalanced cash flow and overloaded the company with debts. In particular, against this background, Megaphone refused to pay dividends (Pavlova, 2017).
5	Attempts for non-market pricing.	After a record decline in mobile revenue and a contraction of margin in the second half of 2016, market players began to synchronously change their pricing strategy on the principle of "more services at a higher price", including at archived rates. The first step was the abolition of unlimited data tariffs in early 2017, the second - the increase in prices for the now limited VAS. The actions of the operators coincided with the local recovery of real wages of the population and led to a noticeable acceleration of the growth rate of mobile revenue in Russia, as well as a regular improvement in the margin. Nevertheless, the actions are interested in antitrust authorities and may have a short-term effect due to the large number of players on the market.
6	Refusal from low-margin retail.	The agreement between the operators to reduce the excess number of communication shops has a positive effect on the margin. For Russian operators, the "net outflow" of the subscriber base has historically been 50-60% per year. In this regard, the decline in sales of actually non-performing contracts can significantly increase the margin. However, the length of the concluded "truce" remains questionable.

3.3. The Main Trends in the Development of the Russian Telecommunications Services Market

Analysis of the current situation in the Russian telecommunications services market allowed the authors of this study to identify several main trends in the development of this market (Table 2).

Table 2. Major Trends in the Development of the Russian Telecommunications Market

№	Trend	Socio-economic content
1	Increased population mobility	A generation is growing up in the country, which already practically does not know what a landline phone is, it's used to always be in touch and have not just a device for making phone calls, but a full-fledged mobile computer with which you can work anytime and from any points. With the advent of new-generation 5G networks, these needs will be more fully met. With the help of mobile devices, you can organize video conferences, watch videos in Ultra HD format and share them with friends, as well as work even more quickly and efficiently.
2	Increase of work efficiency and focus on ever more	The need for omnichannel communication with customers and prompt response to their requests leads the business to integrate

№	Trend	Socio-economic content
	complete customer satisfaction	telecommunication services with the company's IT systems in order to obtain data from them as quickly and accurately as possible. By the way, data, or rather, their security and integrity in the context of the continuous expansion of the perimeter of access to corporate IT resources, is another trend in the telecommunications market. Both telecom operators, application developers, and their users are seriously involved in this issue. For many of them, ensuring data integrity becomes a matter of not just ensuring competitiveness, but also the very existence of the business.
3	Phasing out native communications hardware in favor of cloud solutions, especially in the area of unified communications	So far, such a model is most in demand by small and medium-sized enterprises, that want to implement the most modern solutions at their minimum cost and as quickly as possible. However, over time, when the expensive equipment acquired many years ago will finally become obsolete, large companies can join them. In the face of falling revenues from traditional telecommunications services, telecom operators are actively developing other areas - the provision of cloud services, digital content and services of the Internet of things. Their main advantage is the already formed powerful infrastructure capable of providing the necessary data transfer speed, especially with the presence of technologies such as SDN and NFV, as well as a carefully constructed information security system (Molev-Shteyman, 2018). In addition, in recent years, Russian telecom operators have been actively engaged in the construction of data centers, which they will need, including to implement the "Law of Spring", as well as develop cloud platforms.
4.	Operator change	According to Rossvyaz, since the beginning of 2018, subscribers have changed their carrier almost 2.5 million times. The popularity of operator change services with number preservation (MNP) is growing - in 2018, subscribers leave the operator with their own number to a competitor by 20% more often than in 2017. In total, 10 million numbers have been transferred since the launch of MNP in Russia.
5.	The gradual transformation of telecom operators into full-fledged IT companies	In February 2017, Megaphone announced the completion of the transaction to acquire a controlling stake in the Mail.ru Group holding. MTS entered the market of IT outsourcing and system integration with the support of the NVision Group system integrator acquired in 2015. VimpelCom Ltd, which includes Beeline, changed its name to VEON in early 2017 and began to position itself as a company specializing in digital technologies. And Rostelecom announced a new strategy for 2018–2022, under which it intends to switch to a platform-based business model similar to Amazon, Apple, Google, Alibaba, Facebook, AirBnB, Uber and others.
6.	The beginning of a large-scale modernization of the infrastructure of the telecommunications services market of the Russian Federation in	Operators: - modernize their basic infrastructure; - expand communication channels; - introduce additional capacity of data processing centers (DPC); - Launch new VAS services with competitive time-to-market; - allocate in their organizational structure new divisions for the

№	Trend	Socio-economic content
	connection with the implementation of the national project "Digital Economy"	development of VAS-services.

In addition to the trends shown in Table 1, two more trends can be noted associated with the large growth in the activity of cellular operators in the regions of the Russian Federation, resulting in the growth of subscribers in the Russian regions. Also an important trend is the association of the authors of cellular operators, the result of which is already now the presence of holding operators, who actually control more than 90% of all cellular communications in the country.

In general, it can be noted that, taking into account the established medium-term trends, interest in the investments is represented by oversold shares of mobile operators, offering for this reason a high dividend yield. At the same time, it is worth targeting companies with diversification beyond the poorly predictable in terms of regulation and macroeconomic trends of the Russian jurisdiction.

3.4. The Main Measures of Cellular Operators in Russia to Improve the Tariff Policy in Order to Increase the Competitiveness of Their Own Services

Let us further consider the comparative characteristics of the main cellular operators of Russia in terms of the main parameters that represent the greatest value to consumers (Table 3)

Table 3. Comparative characteristics of the main cellular operators of Russia by main parameters (data for 2018) (developed by the authors, based on expert estimates of RosKomNadzor)

Operators	Percentage of voice connection failures and breaks during a conversation, %	Number of not received SMS, %	Average speed of the mobile Internet, (Mbps)	4G coverage in Moscow and Moscow Region,%	Budget Tariff Plans	Favorable tariff plans
MTS	0,8	2,4	10,1	30,9	«SMART»	"SMART Overseas"
Megaphone	0,7	1,7	13,1	32,2	" Turn on! Write "	"Turn on! Communicate
Beeline	15,1	0,0	5,0	28,8	"All for 350"	"All for 600"
Tele2	1,2	1,2	9,4	8,3	"My conversation"	«My Tele2»

As practice shows, any operator has tariffs that are very popular among subscribers. This is due to the fact that such tariffs include the most optimal set of plug-in packages at a reasonable price. The "SMART Overseas" from MTS, "Turn on! Communicate" from Megaphone, "All for 600" from Beeline and "My Tele2" from Tele2 are among the most advantageous tariffs of cellular operators in Moscow (Comparison of tariffs MTS, Megaphone, Beeline, Tele2, Yota, Tinkoff Mobile and Rostelecom without subscription fees, 2018). Comparison of favorable cellular tariffs in the Moscow region is presented in table 4.

Table 4. Comparison of favorable cellular tariffs (developed by the authors, on the basis of expert estimates of RosKomNadzor)

	MTS	Megaphone	Beeline	Tele2

	SMART Overseas"	"Turn on! Communicate"	"All for 600"	"My Tele2"
Mobile Internet, GB	28	15	10	6
Package outgoing minutes, min.	350	600	800	0
SMS package, pcs.	350	0	500	0
Subscription fee, rubles. / Month.	700	600	600	240
Calls in the home region, rub. / Min.	1,5	2	1,5	1,5
Foreign calls, rub. / Min.	5	3	1,5	2

The study made it possible to conclude that the MTS operator was the cheapest to communicate within the Moscow region, but if we talk about affordable communication throughout Russia, Tele2 is in the lead (Comparison of tariffs of cellular operators, 2018). Comparative characteristics of the tariff plans MTS, Megaphone, Beeline, Tele2 are presented in Table 5.

At the same time, it is difficult to compare the tariff policy of the operators, since the monthly fee for the same service can vary greatly, depending on the region (Shilin & Le, 2016). The most profitable telecom operator without mobile Internet and additional services turned out to be MTS, but at the same time, at the average cost of connected services, MTS is the most expensive operator that offers tariffs that can satisfy both the most economical users and those who want to use their phone at a maximum degree.

Conclusion

According to the results of the study, it can be concluded that Russia is the country where the mobile Internet has received the widest distribution. All the leading companies in the Russian telecommunications services market (Megaphone, MTS, Beeline, Tele2) are developing 4G networks that enable high-speed mobile Internet access, and they are actively preparing to launch 5G and 6G networks. Especially among transport companies that actively use navigation systems, there is an increase in M2M traffic (solutions for the Internet of things) in the corporate segment. The demand for big data solutions and cloud services is also growing, which will make it easy to scale up these solutions as the generated data volumes grow.

These companies are not only actively expanding their communications networks, but also are thinking about the qualitative transformation of their infrastructure in order to optimize operating costs, decrease operational expenses and increase efficiency of business.

The main trends in the development of this market, which are identified and substantiated by the authors of the article, show that competition has reached a very high level, therefore, in the future, the success of the activities of telecommunications services market operators will depend on how their tariff policy will meet current market challenges, as well as changes in consumer behavior in different target segments.

Abstract

The study is aimed at the revealing of the peculiarities of students' communicative skills development. As the trial investigation of informative frames of mind among understudies appears, as they grow up and learn at the College, the structure and builds of correspondence and dispositions in correspondence change. The more seasoned the understudy turns into the more steadfast and tolerant he/she is to other people. Likewise the pattern of improvement of informative frames of mind ought to be noted, where the emergency time of arrangement is the center of preparing. Third-year understudies are more tangled, less tolerant and quiet than rookies and fifth-year understudies. Toward the start of preparing correspondence and related demonstrations of correspondence are gone for the arrangement of the social condition, while toward the finish of preparing informative frames of mind are showed as a fundamental component of private and open life. Open demeanors are showed not just so as to acquire an assortment of data, yet additionally as a device for regular daily existence. Understudies understand the estimation of powerful correspondence, regardless of the way that the dimension of contention increments. Hence, the investigation enabled us to arrive at a significant resolution, in which the principle accentuation is done on the need to bring into the learning procedure at the College some specific projects, trainings, courses went for the arrangement of abilities in the open circle, informative demeanors went for improving the procedure of correspondence because of the requirement for this property by the character in the advanced world.

Keywords: communicative skills, development, educational environment.

Introduction

It is impossible to overestimate the role of successful communication in the development of society in the modern information society. The following aspects and spheres of socially significant communication can be distinguished: the role of communicative strategies in solving social conflicts; communicative mechanisms for the formation of positive attitudes in public opinion; successful public communication of socially significant figures (politicians, public figures); ethics in public communication; changing speech patterns of behavior; the role of public relations in the formation of corporate civil liability; the role of mass media.

In the high-tech global world, public communication acquires another important component, namely, professional communication (Sorokoumova, 2013; Cherdymova, 2013; Ju et al., 2017). Professional (as opposed to business) communication is understood as the specificity of communication skills determined by professions, whose essential component is the obligation to enter into communication. Such professions include, first of all, teaching, political activity, management, social work (including medicine), public service.

Considering each of these professions, one should talk about a certain amount of knowledge, skills, attitudes necessary for successful professional communication and, accordingly, successful professional activities.

The problem of the role of social focus and its value orientation are considered in the works of A.G. Asmolov and M.A. Koval'chuk (1977), U.L. Kolb (1961), A.G. Zdravomyslov (1996), I.I. Zhukov (1976), V.A. Yadov (1979), V.A. Yadov (1995), R.A. Kutuev et al. (2018), etc. In the studies of scientists the need is proved and the emotional value component of communicative attitudes is theoretically substantiated, the importance and necessity of axiological communication for the theory and practice of socially-oriented research is proved, the ways for value relations formation in certain types of activity are shown.

The analysis of researches on the problem of development of professional communication shows that the majority of them is based on the idea of socio-psychological communication of G.M. Andreeva (1981), Y.S. Krizhanskaya and G.P. Tretiakov (1987), etc., on the findings of scientists on the psychology of educational activity of A.A. Ruchka (1976), A.A. Leontiev (1997), A.A. Leontiev (1975), A.A. Devyatkin (1998), etc.

In the domestic psycho-pedagogical studies different approaches to the problem of development of communicative units in the universities are demonstrated: with the help of certain communicative tasks (Alekseeva, 1984; Kananishvili, 1994; Uznadze, 1961; Gluzman et al., 2018); pedagogical designing and pedagogical technologies; through the specifics of the pedagogical communication (Leontiev, 1972); professional self-concept; professional motivation; the concept of socio-psychological aspects of training and education; through the definition of key features and style of teaching. These studies can serve as a scientific basis for the development of a holistic concept of development of student' professional communicative attitudes. Scientists classify all previous attempts to define the attitude: "Previous definitions of attitude can be attributed to one of four classes:

1. The author presents and proves his own definitions of attitude. He argues, however, that the definition may not be identical to what is already available.
2. The author considers many variants of other definitions and gives preference to one of them, or proposes a new definition.
3. The author allows for a variety of definitions of the attitude, because of desperate to find a consensus.
4. The author, who tries to translate various definitions of *attitude* into ordinary spoken language and with the help of it to develop the direction of convergence of different directions.

According to the teachings of D.N. Uznadze (1961), human behavior is regulated at two levels: impulsive and volitional.

In the first case, the source of activity is a biological need, which in the presence of actual conditions for its satisfaction forms an actual focus - readiness to act in the direction of meeting this need. The latter one leads to impulsive behavior.

At the volitional level that distinguishes human behavior from animal behavior, the willingness to act is preceded by understanding the complex situation (the act of objectification) and finding an algorithm of action that corresponds to "..the main focus of the individual which is embodied in the life". The focus arising on the basis of comprehension, Uznadze called fixed focus, the system of which gives grounds for directed behavior.

According to U.L. Kolb (1961) the history of *value orientation* category is identical to the history of *attitude* (social attitudes). Some scientists associate the introduction of the concept of *value orientation* in the socio-psychological Sciences with T. Parsons (1997) theory.
In world psychology there is a huge number of works devoted to values and value orientations, their hierarchy is studied. Expressing certain qualities of a person, value orientation is at the same time a means of realization of certain social goals. In most modern studies, values are considered from a socio-psychological point of view; appear as a social phenomenon, as a product of society and social groups' life-activity.

Thus, according to M. Rokich (2009), value is a stable belief that a certain way of behavior or existence is individually or socially preferable before, or along with any other way of behavior or existence in a similar situation. The value system is a stable set of beliefs. Highlighting three types of beliefs: existential, evaluative and prognostic, M. Rokich (2009) refers the values to the last, the third type, allowing navigating within the desirability-undesirability of behavior (operational, instrumental values) and existence (semantic, terminal values).

Communication skills are a synthesis of General psychological, socio-psychological and special-professional qualities of the individual. They are formed in the course of a variety of social practices and the inclusion of the individual, as well as in the course of special training to communicate.

The communication process is provided by acts of communication and interaction of the subjects of the communication process.

When solving the problem of education and training, communication allows providing real psychological contact with students; forming a positive motivation for learning; creating a psychological environment of collective, cognitive search and joint solutions, establishing a positive psychological climate.

Materials and Methods

2.1. The Methods of the Research

The method of unfinished sentences was used in the research process. The proposals were selected in such a way as to reveal the nuances regarding the following aspects of communicative attitudes, grouped by us into several units.

The first unit, B1, combines a priori ideas about communication as a whole and includes such incentive proposals as "communication is first of all", "communication is necessary for" and "communicating with others, we". Since communication can be understood in different ways, and even in the scientific literature there is no single approach, before one begin to analyze the individual attitudes of communication it is necessary to answer the question, what is communication for our respondents.

The proposals included in the second unit, B2 relate to such an important component of the focus as emotional communication. Unfortunately, in this study it is impossible to analyze all the emotions associated with different communication practices, so we focused on the emotional perception of communication "communicating with others I feel" and identifying the characteristics of causing the most positive perception of "I am always happy to communicate with". Interaction with another is often the main feature of the definition of communication. We are primarily interested in practices, conditioning the ability to listen and be heard. What for was proposed quite simple incentives: "to be heard by the others you should" and "to understand another." Psychologists often try to assess the success of communication, its positivity or negativity. At the same time, they tend to interpret positivity as tolerance, conflict-free. In our research, we raised the question of how students themselves believe what is a success in communication. B3 For the solution to this question works the incentive "to be a successful person in communicating means." In addition, it is necessary to find out what practices, according to students, are a manifestation or a means of achieving *success* in communicating. Therefore, unfinished sentences were composed "one can be successful in communicating if" and "one can be successful in communicating only in case of".

Separately, we found it necessary to allocate the study by the method of unfinished sentences of such an aspect as the perception of another B4. "To achieve your goal is possible if in relation to the other you are" – the stimulus reveals the position which is different in relation to the studied subject. Regarding this incentive, we had assumptions that it will help to identify whether the other is a full subject of communication, and whether it is considered as an opponent or ally in achieving the goal.

Unit B5 is set to assess one's own position in communication. How much a person considers him/herself a subject able to influence the course of interaction with others, and by what means one can manage the process of communication is revealed in the sentence "people's relationships can be regulated by". The sentence an incentive by a "person is shown" in this study did not work as it gave too facile a priori representation. Unit B6 p reveals the understanding and causes of *failure* in communication. We have identified practices that hinder the achievement of communication goals by such incentives as "communicating with others is impossible" and "one can offend a person."

In any social interaction it is possible to find prescriptions and norms which are obligatory from the point of view of its participants. Of course, communication, in which students come as sociologists, is no exception. Therefore, the study included sentences in unit B7, identifying priority rules of communication: "People in relation to each other should", "the basic principle in relation to other people is" and "in communication a person should".

For a full analysis of communicative attitudes it is necessary to fix the perception of basic, in our opinion, social positions-the status of another (unit B8): "stranger", "friend", "close person". "When I talk to strangers," "I think I'm a real friend," and "really close people."

The ninth unit B9 is focused on the identification of communicative practices perceived as the most difficult for the individual. "Interacting with others the hardest thing is."

This method was actively used for the study of social psychological phenomena, for example, V.B. Olshansky (1997) used it in the study of social expectations.

S.G. Klimova (1995) used this technique to study the identification and improvement of semantic constructs "one's own" - "alien", "we" - "they" [43, p. 49-63].

G.G. Tatarova (2007), G.G. Tatarova (1997), Burlova (1997) emphasizes that one of the strategies of using the method of unfinished sentences is to identify a priori ideas of people about a particular situation in their daily lives.

2.2. The Experimental Base of the Research

The empirical research was conducted on the basis of Samara University, faculty of sociology. Thus, the study studied the communicative attitudes of students of three groups:

Group 1-1st year students of sociological faculty of SamSU, 14 people.

Group 2-3rd year students of sociological faculty of SamSU, 15 people.

Group 3 – students of the 5th course of sociological faculty of the University, 11 people.

In each group, the survey was continuous. The total number of students studied was 40

2.3. The Stages of the Research

The study of the problem was conducted in three stages:

Stage 1 - development of initial positions on the basis of theoretical analysis of the literature on the subject of research; development of the General concept of research, including methodological principles and the project of development of the research tool.

Stage 2 - development of a research tool to identify the features of communicative attitudes.

Stage 3 - an empirical study of the characteristics of social Sciences student communicative attitudes. A sample was formed, empirical data were collected. Preliminary results were obtained. Analysis and interpretation of the results were carried out.

Results

The communicative attitude first of all reflects the propensity to a certain behavior in a situation of communication, the willingness to see in another a full subject of relations, ideas about the purposes of communication and the possibilities of achieving these goals. We tried to characterize these elements of communicative attitude in our research.

First of all, we tried to describe the readiness for interaction and acceptance of the other.

Table 1. Negative communicative focus of students - sociologists

Indicators	Maximum points (100%)	The received points			Percentage of maximum points		
		1st year students N=14	3st year students N=15	5st year students N=11	1st year students N=14	3st year students N=15	5st year students N=11
Veiled cruelty	20	14,9	14	12,2	74,6	70	61,3
Open cruelty	45	22,6	21,1	24,1	50,3	46,9	53,7
Justified negativism	5	2,5	3,06	2,3	50	61,2	47,2
Grumbling	10	4,1	4,2	4	41,4	42,6	40
Negative communication experience	20	9,6	10,4	7,4	48,2	52	37,2
Total	100	53,7	52,76	50	53,7	52,7	50

Considering the distribution of negative communicative attitude, we note the following characteristics.

Indicators of veiled violence decrease as students grow older. Thus, they reach 74.6% among the first – year students, and 61.3% among the fifth-year students. Therefore, the older the student gets, the less he tries to hide his cruelty. This can be explained by the fact that among the students in more senior courses in comparison with the first course, the process of socialization in the University has already passed, they try not to hide their feelings and relationships, the process of their self-identification is successful and they can openly talk about the problems.

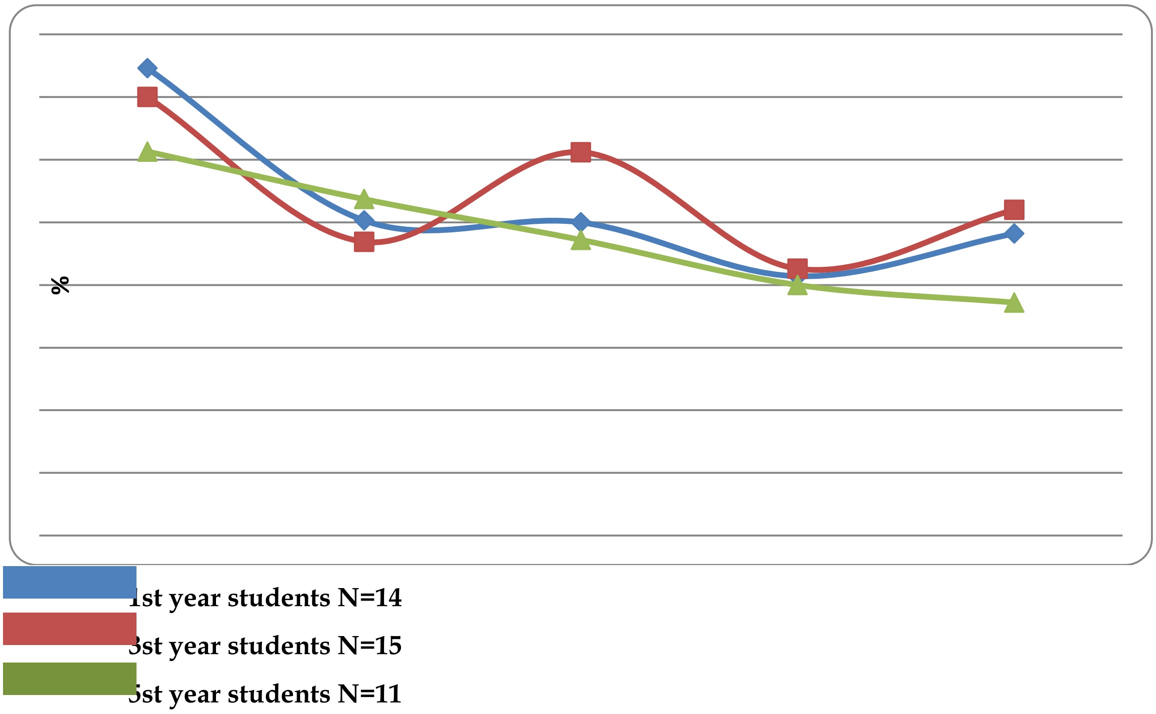

Figure 1. Distribution of indicators of negative communicative focus among students (%ratio)

An important conclusion and proof of the disclosure of *themselves* among the students as they grow up is an indicator of *open cruelty*. We believe that a negative indicator is that half of the students possess this quality. Moreover, it is the least pronounced in the 3rd year students (46.9%), and the most pronounced in the 5th year students (53.7%). Such data indicate the negative impact of social factors of the environment in which students live, namely the impact of the mass media from a negative, aggressive position, as well as the negative consequences of the transformation of socio-economic development of the Russian Federation in the last 15 years.

As they study at the University indicators of reasonable negativism, denial of sustainable concepts, some degree of nihilism are reduced (from 50% to 47.2%). And the 3rd year students show the highest level of negativity (61.2%). This is due to the fact that while studying at the University, students seem to "cool down" to the process of studying they internally calm down, know all the methods and principles that occur during their studies, understand that they are "already learning". Their motto is "from session to session". It was during these years, many of them begin active professional and labor activity, believing that it does not interfere with them, that the main thing is a career.

Thus, the analysis of the research indicators gave us the opportunity to realize the fact that the *critical* period of study for students is the average period at the level of the 3rd year. One should note the fact that as one gains experience, negative attitudes to communication are leveled and more positive experience will appear. This is facilitated by the process of socialization, as well as awareness by the youth of the learning process at the University, the role of effective, constructive communication in interpersonal communication.

One can consider the indicators of reduced tolerance.

Table 2. Indicators of reduced tolerance

focus component			
	1st year students N=14	3st year students N=15	5st year students N=11
Rejection or misunderstanding of a person's individuality.	5,4	5,5	3,8
Using oneself as an etalon when evaluating others.	4,5	3,8	2,7
A categorical approach or conservatism in people estimations.	6,5	5,7	3,4
Inability to hide or smooth out unpleasant feelings when faced with uncommunicative qualities of partners.	7,5	6,7	3,6
The desire to remake, re-educate partners.	4,7	5,1	4,5
The desire to fit a partner for oneself, make it convenient.	6,7	5,8	3,8
The inability to forgive another mistakes, awkwardness, unintentionally caused you trouble.	5,5	5,9	5,7
Intolerance to the physical or mental discomfort of the partner.	5,2	4,6	2,5
Inability to adapt to partners.	5,5	4,7	2,9
In the sum:	61,4	47,8	32,9

Discussions

Interpersonal communication and subject-subject relations occupy a special place in the system of communicative relations. Human egocentrism in an urbanized society of scientific and technological progress can be destroyed, first of all, by the warmth of interpersonal relations, a return to the fundamental principle of society – to live interpersonal communication.

We note that the essence of social communication is mutual understanding between people and the interaction based on it. Communication is a complex, multifaceted phenomenon. It identifies and considers three main components - information (information and communication), perceptive and interactive.

The information component of social communication is characterized, firstly, by the fact that human communication is not a simple *movement of information* between two devices; here we are dealing with the attitude of two individuals, each of whom is an active subject: their mutual informing involves the establishment of joint activities. Second, the nature of information exchange between people is determined by the fact that through a system of signs partners can influence each other. Third, communication influence as a result of information exchange is possible only when the person sending the information (Communicator) and the person receiving the information (recipient) have a single or similar system of codification and de-codification. Fourth, in the context of human communication, specific communication barriers may arise.

Communication skills are formed in the process of education. The process of becoming a versatile personality also includes the requirements of mastering the ability to formulate thoughts correctly and clearly. Communicative competence is developed over the years and is therefore the result of great work.

V.B. Kashkin (2000) identifies a special concept of *communicative personality*; this concept implies a set of individual communication strategies and tactics, cognitive, semiotic, motivational preferences, formed in the processes of communication as the communicative competence of the individual. The communicative behavior of mankind also consists of common moments in the behavior of individuals. There are only separate individuals whose communicative behavior is a single language. But also in the behavior of the individual the properties of natural and social (including communicative) environment are reflected. Communicative personality is heterogeneous, can include different roles (voice, polyphony of the personality), and while maintaining their identity.

There are three defining parameters for a communicative personality: motivational, cognitive and functional. Based on one's communication needs, communication focus is formed, which is accompanied by communicative personality over a certain period of communication (there are various communication tools and tactics).

As we have found, the communicative attitudes of students-sociologists during their studies at the University are gradually changing. The nature of relations to oneself and to the world is complicated, which is caused by socio-psychological changes in the personality, as well as understanding and awareness of the process of effective communication act in the understanding of oneself and another. Communicative focus and communication process becomes a vital condition for the success of socialization in society, which is supported by the requirements of the world of professions, where effective communication skills are already the standards of many professions. Despite the fact that the student's age by age periodization refers to youth, this age allows for a person's mental personality qualities to be quite labile and plastic. Consequently, the role of higher education in the formation of effective communicative attitudes is an integral part of the educational process.

The dynamics of communicative attitudes among students allows us to make the most important conclusion that it is necessary to constantly improve the educational process, allowing developing communication skills and attitudes.

Conclusion

As the experimental study of communicative attitudes among students shows, as they grow up and study at the University, the structure and constructs of communication and attitudes in communication change. The older the student becomes the more loyal and tolerant he/she is to others. Also the trend of development of communicative attitudes should be noted, where the *crisis period of formation* is the middle of training.

Third-year students are more conflicted, less tolerant and patient than freshmen and fifth-year students. At the beginning of training communication and related acts of communication are aimed at the formation of the social environment, while at the end of training communicative attitudes are manifested as a necessary element of private and public life.

Communicative attitudes are manifested not only in order to obtain a variety of information, but also as a *tool* for everyday life. Students realize the value of effective communication, despite the fact that the level of conflict increases.

Thus, the study allowed us to come to an important conclusion, in which the main emphasis is done on the need to introduce into the learning process at the University some specialized programs, trainings, courses aimed at the formation of skills in the communicative sphere, communicative attitudes aimed at improving the process of communication due to the need for this property by the personality in the modern world.

As the study, aimed at the study of the reduced tolerance showed - as they grow older and the individual's socialization takes place in terms of the University the indicators are reduced.

Rejection or lack of understanding of a person's individuality is reduced from 5.5 points to 3.8 points, which indicates the formation of the ability to understand the other, the development of ideas about the "self", individual characteristics, the stage of final forming of ideas about the self of human existence.

As they grow older, student uses less him/herself as an etalon, a pattern of behavior (from 4.5 points to 2.7). This indicates a decrease in the degree of self-centeredness, recognition of other authorities and authoritative opinion.

A categorical nature or conservatism in views about other becomes less, which indicates the departure from the traditional adolescent egocentrism, the recognition of only own self. The concept of *loyalty, tolerance* in the opinion of others becomes important.

Especially noticeable is a decrease in negative tolerance in the field of inability to hide or smooth out unpleasant feelings when faced with non-communicable qualities of partners (from 7.5 points to 3.7 points for students of the last year of study). In this situation, they use the tactics of avoidance and compromise, which can also be explained by the development of loyalty. We believe that such qualities should be especially developed among students-sociologists, who due to their professional activities will have to deal with different people, with different psychological characteristics and manifestations of the psyche.

It should be noted that the student desire to remake, re-educate in the course of the study does not disappear. Moreover, in the third year, these values become more. Such data indicate the presence of mentoring, dictatorial directions in communication, which may be due to the prestige of training in the SamSU.

Also, as well as the inability to forgive mistakes, does not change in the course of students' study at the University, which indicates the difficulty of forming tolerance as a necessary quality of personality of students of the faculty of sociology.

The indicators of intolerance to shortcomings, as well as the inability to adapt to partners as they grow older, are declining, but we believe that it is not enough. These indicators may be lower; however, they indicate that the modern student is intolerant, incapable of empathy.

Thus, we believe that for the development of tolerance during training it is necessary to introduce specialized courses aimed at the development of tolerance, the formation of understanding of the other. Especially important is the taking into account of personality traits in connection with their future professional activity as sociologists.

Abstract

Instructive and proficient infantilism is an uncommon, ruinous method for the person's self-acknowledgment during the time spent getting proficient instruction, the attributes of which are negativism in connection to instructive and proficient exercises, extreme requests on the encompassing individuals and society all in all, dynamic or uninvolved restriction to the instructive procedure, the absence of sufficient emotional frame of mind to its arrangement and improvement as a future expert and, as needs be, to the instructive action itself, the absence of designs for self-acknowledgment in the calling and throughout everyday life, and genuine approaches to actualize them, the commonness of tight close to home, narrow minded thought processes and objectives of the preparation and expert exercises. Thus, the creators pf this paper examine the socio-mental attributes of understudy infantilism appearance. It is set up that the investigation of socio-mental qualities of social infantilism of present day understudies is important to improve the productivity of instructive and mingling exercises of colleges, the revision of juvenile, freak practices models, and to settle and grow socially endorsed, relating to the time of adulthood. The materials of the article can be helpful for clinicians, College educators, caretakers of understudy gatherings and are of reasonable significance for the advancement of mental and academic projects went for improving the productivity of understudy juvenile standards of conduct's rectification during the time spent learning at the College.

Keywords: educational environment, infantilism, necessary adult personality, motivation.

Introduction

Since the end of the XX century in the public consciousness of Russians a myth was rooted that higher education is mandatory for all, as it is a necessary link in building a successful career, and sometimes just a categorical condition of employers in hiring. The number of both public and private universities and their branches in different regions has increased dramatically. This allowed satisfying both the reluctance of graduates to leave the usual parental home, in which parents are responsible for everything, and the desire of parents to leave their children at home because of the fear that otherwise they will not be safe and will not be able to properly dispose of their independence.

Psychologists say that the effect of these trends has been the wide distribution of such a socio-psychological phenomenon as age-related increase of childhood. Admission to University after graduation is often no longer perceived as the beginning of the adult stage of life, and psychologically is perceived as a logical continuation of the schooling stage. This leads to the spread of student infantilism. The student retains both psychological and social features inherent in the student, which creates both difficulties in the process of socialization, social adaptation, learning and personal and professional development for the student, and difficulties in the pedagogical and educational activities of teachers (Nazarov, 2015; Gluzman et al., 2018).

V.A. Khriptovich (2015) notes that instead of generation X, who sought to grow up soon, become self-reliant and successful, generation Y has come (the Millennium generation) that is characterized by the late social and civil development and the desire to be forever and to stay young. And varieties of modern infantile individuals appeared: children-boomerangs – living with parents single young people after graduation from the high school; kidult — (eternal children), which carry into adulthood the habits and behaviors typical of adolescents; juveniles characterized by personal-psychological immaturity and a number of other.

Infantilism in General is a social characteristic of the individual associated with the passage of its stages of primary and secondary socialization and social adaptation and is expressed in the differences in the social, physiological and cultural maturation of the younger generation, due to the varying degree of influence on the personality of certain social institutions. Infantilism is manifested in the lack of human desire to learn a new social role and willingness to responsibility, which causes disturbances in its social reality (Abdrakhimova, 2016).

Social infantilism is a negative form of adaptation to the social environment as a result of the immaturity of the emotional-volitional sphere and the weakness of motivational-value-based attitudes to personal development in the process of socialization and social interaction of the individual. It is manifested in the rejection by the personality of new social roles, due to the process of growing up, of passivity in relation to any problematizing situations and shifting responsibility onto others or external circumstances (Degterevskiy, 2010).

G.Z Efimova (2014) argues that the features of social infantilism can be manifested in any person in various spheres of life, but socially significant infantilism becomes in those cases when it manifests itself in vital areas – in professional and socio-political activities, in family and domestic relations and others, or affects several areas of human activity, inhibiting and deforming both their development and the development of the person so that, social infantilism is a type of social deformation of the individual.

Considering the social and moral aspect of social infantilism, A.S. Bakulina (2014) notes that it can have negative features, consisting in a tendency to various kinds of physical and psychological addictions, irresponsibility, deviations in the emotional sphere, and so on, and relatively positive, associated with idealism and hyper-sociality.

A.A. Seregina (2011) notes that the personality infantilism is the undoubted reason for the formation of deviant behavior. Insufficiently developed emotional-volitional sphere is the reason for the lack of focus on the volitional regulation of their behavior, complicated by impulsive, explosive nature, uncontrollability of emotions, and instability of mental States. Dependent (parasitical) life attitudes lead to promiscuity in how to meet their needs. The low level of claims and the need for achievements, inadequate self-estimation are the cause of irresponsibility. The unformed motivational sphere and hierarchy of motives, the predominance of hedonistic motives, the minimum ability to reflexing, analysis of one's own actions and the actions of others, the reluctance to self-determination in both personal and professional pan, the priority of material values over the moral and morality of an infantile personality are a serious risk of its deviant behavior.

One of the main types of student social infantilism is educational and professional infantilism, which is defined as difficulties in adapting students to the conditions of educational and professional environment, manifested in the presence of negative motivational and value-based attitudes towards personal and professional development, in the weak ability to apply professional knowledge in practice, in the low level of independence and responsibility of the student, in a passive life position, in the lack of awareness of the made choice, in the low level of analysis and control of their behavior, in refusing from the help of teachers and family members. Features of emergence and manifestations of this type of infantilism among the students are expressed in a deviation from generally accepted cultural and social norms and in personal disorganization. Educational and professional infantilism manifests itself in following the previously established destructive strategies of social behavior and activity, in a negative reaction to the purposeful educational impact on the part of others, in focusing on new negative examples of personal experience (Apraksina, 2008; Utenkov, 2011).

There is another point of view. Thus, on the basis of their study, E. V. Koroleva, N. G. Ivelskaya and A. L. Chernysheva (2017) believe that the perception of modern students as socially immature individuals is incorrect and not justified. They argue that students are very active in the social field, in educational, labor and public activities. They revealed the majority of students with high degree of social adaptation, a wide range of interests, high responsibility for their decisions, awareness of themselves as active participants and creators of social changes, the desire to achieve their goals, increased interest in everything new both in the social sphere and in the educational and professional spheres. But at the same time, they do not talk about the complete absence of infantilism among students, although they argue that the infantile qualities of modern students do not go beyond the critical indicators and do not prevent them from developing effectively and dynamically.

The above mentioned aspects actualize the study of social infantilism of students in General and educational and professional infantilism in particular, as well as the socio-psychological characteristics of infantile students to determine the targets for prevention and minimization of this socio-psychological phenomenon.

Materials and Methods

2.1. Theoretical methods

The theoretical method of research is the content analysis of scientific works related to the problem of social and educational and professional student infantilism and the criteria - its components, which allows to comprehensively consider the degree of development of this problem and to identify the main approaches to its understanding and the factors that determine the risk of strengthening the manifestations of social infantilism in the student environment.

2.2. Empirical methods

We conducted an empirical study aimed at studying the socio-psychological characteristics of students with different levels of severity of infantilism using the following methods:

-to determine the groups of students with different levels of infantilism, we used the method *Level of expression of infantilism* developed by A.A. Seregina (2006). Since infantile features are inherent in varying degrees to any person, in our study we distinguish low, medium and high level of students' infantilism.

-to study the features at the socio-motivational level, the methods of diagnosis of socio-psychological adaptation of K. Rogers and R. Diamond (Fetiskin et al., 2002) and diagnosis of the motivational structure of the personality of V.E. Milman (Ilyin, 2011) were used.

- to study the characteristics on the social activity level, the questionnaire of initial socio-psychological competence of S.A. Barinov (2007) and technique for self-assessment diagnostic achievement of life goals implementation of the individual of N.R. Molochnikov were used (Fetiskin, etc., 2002).

Results

3.1. Features of social and motivational sphere of students with different levels of infantilism

The average values for the diagnosis of socio-psychological adaptation of students with different levels of infantilism are presented in table 1.

Table 1. The intensity of integral indicators of student social and psychological adaptation with different levels of infantilism severity (average values)

Indicator	High level	Average level	Low level
Adaptation*	93,12	104,31	123,74
Self-acceptance	32,47	28,32	34,99
Acceptance of others*	14,42	19,31	23,02
Emotional comfort*	16,07	25,86	24,53
The desire to dominate*	43,39	35,71	28,41

Internal control*	10,07	12,71	13,94

Note: * - a significant difference of the average indicators (T-student test) between the indicators of students with high and low levels of infantilism (p≤0.05) is established.

As it can be seen from the table, students with a high level of infantilism have significantly lower rates of adaptation, acceptance of others, emotional comfort and internal control, and significantly higher rate of desire for dominance. Therefore, we can say that infantile students are less adapted in society; it is more difficult for them to accept the positions and interests of other people. They are more likely to experience emotional discomfort in various situations and are more exposed to external control, by significant others, are guided by others opinions and shift responsibility for themselves to them. At the same time, they tend to dominate the immediate environment to be able to manipulate, to insist on fulfilling their desires, indulging their weaknesses.

The average values of the diagnosis method of the individual's motivational structure are presented in table 2.

Table 2. Intensity of student personality motivational structure with different levels of infantilism (average values)

Indicator	High level	Medium level	Low level
Life-support*	5,43	6,15	7,38
Comfort	3,92	4,90	3,47
Social status*	4,25	7,13	7,92
Communication	9,91	8,93	8,33
Common life orientation of personality	*5,88*	*6,78*	*6,78*
overall activity	8,37	6,10	11,21
Creative activity*	5,13	5,65	9,12
Social utility*	2,97	4,34	7,25
*Working (learning) orientation of the person**	*5,49*	*5,36*	*9,19*

Note: * - a significant difference of the average indicators (T-student test) between the indicators of students with high and low levels of infantilism (p≤0.05) is established.

Based on the data obtained, it can be seen that students with a high level of infantilism have common life orientation of personality which is expressed approximately to the same extent as students with low and medium levels have. But at the same time, they have significantly lower indicators for such criteria of common life orientation as the desire to independently provide for their life needs and to achieve a high social status by their own efforts. And work and learning motivational orientation of students with a high level of infantilism significantly lower than among non-infantile students. Here, such criteria as creative and social activity are significantly less pronounced. Therefore, for students with a high level of infantilism, success in educational and professional activities through the manifestation of creative and social activity is not the leading motive of life activity, as well as the achievement of life benefits and social status on their own.

3.2. Features of the social and activity sphere of students with different levels of infantilism

The average values of the questionnaire for initial socio-psychological competence are presented in table 3.

Table 3. The severity of formation degree of student initial socio-psychological competence indicators with different levels of infantilism severity (average values)

Knowledge:	High level	Medium level	Low level
the relationship between socio-political attitudes and labor productivity	1,43	1,78	1,92

relationship between the social status of population groups and their attitudes*	3,07	4,45	5,21
the relationship between changes in socio-political attitudes and readiness to act	1,84	1,68	2,35
the relationships between features of situations and social manifestations*	2,97	3,73	5,05
the relationship of mental qualities and social manifestations*	3,34	4,11	5,79

Note: * - a significant difference of the average indicators (T-student test) between the indicators of students with high and low levels of infantilism ($p \leq 0.05$) is established.

From the data presented in the table, we can see that students with a high level of infantilism have much lower knowledge about the relationship between the social status of population groups and their attitudes, the relationship between the characteristics of situations and social manifestations, as well as the relationship of mental qualities and social manifestations. Consequently, they are less aware of how the mutual determination of a person's social status and their social perception, evaluation, awareness and behavior based on stereotypes in a particular social group occurs. It is more difficult for them to imagine how to behave in certain situations, and how their behavior can affect the development of these situations. They have little idea how certain personal characteristics of the human psyche affect his behavior and how they manifest themselves in social interaction, and how interaction and communication in society can form the psychological characteristics of the individual.

Rank indicators on the method of self-assessment diagnostics of the person life goals realization are presented in table 4.

Table 4. Expression of self-assessment of the individuals' life goals realization among the students with different levels of infantilism severity (ranks)

Indicator	High level	Medium level	Low level
Job, career	5	5	2
daily life	3	4	4
physical state	2	2	3
Social condition. Human relations.	1	3	1
Mental readiness. Psychological state.	4	1	5
Family life	6	6	6

Note: since the technique is based on the integrative design of personal self-development in resource and time ratio and priority setting (ranking), the procedure of checking the reliability of the difference in average indicators was not carried out.

The data obtained indicate that for students with a high level of infantilism and low, the importance of the implementation of life goals in the field of social status and human relations is in the first place. But the analysis of the questions included in this unit of technique showed that students with a high level of infantilism received the greatest number of answers to questions related to friendly relations and imposing their opinions on other people. And students with a low level of infantilism have questions related to the interest in the opinion of others, the ability to listen and the desire to develop those people with whom they communicate. But those and other students are about equally concerned about friendly relations. For students with a low level the implementation of goals related to work and career by the importance is on the second place, and for students with a high level – the penultimate. In the last place all students have goals related to family life, which is explained by age and the current trend in the country to create a family in a more Mature age, which can be determined as infantile manifestations – unwillingness to take responsibility for the family and for children, and the desire to become self-sufficient, to take place as a person and as a professional to be able to provide for the family, to create decent living conditions.

Conclusion

In modern society, graduates of higher educational institutions are imposed increasingly higher requirements while reducing the time to obtain appropriate personal, professional and social knowledge, skills and abilities, due to the transition from specialty to bachelor. This problematizes for school graduates, *yesterday's children*, the process of learning, adaptation and socialization in new conditions. The problem of employment of graduates is complicated by the uncertainty of judgments about their prospects, about the future, the lack of a clearly understanding of life scenario and the image of future employment in the specialty obtained at the University, as a result of which they find work in areas which is not related to their specialty and often does not require higher education. This is one of the consequences of the growing trend of social infantilization of young people. Student infantilism becomes an obstacle to the formation of an integral adult personality, its self-realization and self-development, can cause deviant behavior, and, accordingly, requires a comprehensive study to develop effective corrective programs for this negative socio-psychological phenomenon prevention.

Under social infantilism in modern social psychology the backlog of socio-cultural maturation of the individual from the biological one is understood, determined by the violation of the socialization process, arising from the presence of inadequate problem socio-cultural conditions, and manifested in the denial by youth of new social roles and related to them responsibilities and obligations arising in the process of growing up.

The theoretical analysis revealed the main determinants of social infantilism among students. These include:

- from the civilizational worldview: the trend of postmodernism as a leading socio-cultural direction of the modern stage of the society development, the essence of which is a game designed to create a chaotic order of the existing ordered systems, in which there is no place for the value vertical and the meaning of existence;

- on the part of society: first, the situation of the transition stage of society development, associated with a change of ideology, value-normative guidelines and models of social behavior; secondly, the formation of a consumer society, in which the development of personal skills associated with personal, social and professional development, is replaced by an extensive market of services for all occasions that you can just buy;

- on the part of the education system: firstly, the increase in the period of school education leads to an increase in the duration of childhood and to a decrease in the psychological age of modern youth; secondly, the lack of effectiveness of educational and socializing functions in the system of higher professional education leads to uncontrollability of the process of social and professional adaptation of students;

- on the part of the family: a large number of single-parent families or families with one child have led to the spread of hyper-custody, preventing the development of the child's independence and responsibility for themselves and for others;

– from the side of the media: firstly, the promotion of the cult of *immaturity*, *Peter Pan syndrome*, the image of a nymphet or a playboy, the popularization of the image of an easy and carefree life for your pleasure; secondly, the spread of the Internet and network communications forms a model of non-binding communication, during which you can be anyone.

In the course of the empirical study of the characteristics of the socio-motivational sphere, it was found that infantile students have the most pronounced features such as increased social maladjustment, difficulties in understanding and accepting the points of view of others, emotional discomfort. The main motives for their behavior are their own desires and interests, which they carry out through either subordination to external influence, if it corresponds to them, or through domination and manipulation of others, but always shifting responsibility for the consequences to those who helped them meet their selfish needs. The main motivational orientation of behavior and activity of such students is the common life orientation, which consists in maintaining and improving personal comfort in their own understanding, and the working and learning motivational orientation, focus on social and creative activity is expressed much weaker than among the students with a low level of infantilism.

In the field of social activity of students with a high level of infantilism the insufficient level of the initial socio-psychological competence formation is revealed, which is expressed in an inadequate understanding of the mutual conditionality of the social situation of a person and the characteristics of his/her social perception and behavior, a lack of understanding of the behavior correspondence to a particular situation, as well as its possible consequences, as the inability to assess the psychological and emotional characteristics of people and their impact on the specifics of interaction. For them, it is more important to realize their life goals in the field of communication, friendship, and not in the field of learning and professional activities. Like students with low level of infantilism, they do not consider to be important to achieve goals related to family life, due to age and the current trend in the country to create a family in a more Mature age, which can be explained by the fact that infantile students do not want to take responsibility for the family and for children, and students with a low level of infantilism want first to become self-sufficient, to take place as a person and as a professional, to be able to provide for the family, to create decent living conditions for it.

The study of socio-psychological characteristics of social infantilism of modern students is necessary to improve the efficiency of educational and socializing activities of universities, the correction of infantile, deviant behaviors models, and to stabilize and develop socially approved, corresponding to the period of adulthood. The materials of the article can be useful for psychologists, University teachers, curators of student groups and are of practical importance for the development of psychological and pedagogical programs aimed at improving the efficiency of student infantile behavior patterns' correction in the process of learning at the University.

Abstract

It is resolved that from the socio-philosophical perspective, the comprehensive idea of the picture suggests its understanding as a multidimensional, mechanical, conflicted informative and administrative marvel, which has a representative nature, emerging because of the observation by the individual or gathering of people of coded message, adding to the completion in their brains and sub-cognizance of the required intentions of conduct including the systems of ID, self-recognizable proof and self-introduction. The picture of the understudy has comparative qualities, yet in addition has various explicit highlights. Its assorted variety is dictated by the way that it is framed in the field of contact and interpenetration of the social condition of society and the particular social condition of a specific College. Innovative nature lies in the way that its arrangement can happen unexpectedly through the abstract observation and assessment of the objects of the encompassing reality during the time spent self-advancement, and through focused mental and instructive impact during the time spent preparing and training. Uncertainty is showed in the way that the arrangement of the understudy's picture can be joined by an adjustment in the officially natural individual quirks and attributes, and the presentation of new ones either through their genuine installing into the structure of the character, or through the formation of a dream of their quality. The open and administrative quintessence of the understudy's picture is that its arrangement during the time spent reflection adds to the development and improvement of the understudy's character from one viewpoint, and on the other – during the time spent picture correspondence changes the picture of the world among the picture beneficiaries. Enough shaped picture adds to the fruitful socialization and successful expert movement of the understudy later on.

Keywords: Identity, student image, development, social and philosophical view.

Introduction

The study of both the personal image of the student and the students in General is actualized nowadays due to the entry of the world civilization into a new formation – the information society, when information becomes one of the main resources for well-being, and one of the important means of achieving the goal in both personal and public life. Real communication is increasingly replaced by virtual ones, in which the main subjects of communication are not so much the people themselves as the images that, on the one hand, they create themselves, on the other hand – images associated with existing stereotypes, and the third – the images formed in the minds of one side of communication in relation to the other (Kutuev et al., 2017; Ju et al., 2017; Gluzman et al., 2018). In the field of such communications, in order to achieve success, it is necessary to understand the basics of creating an adequate image of the individual, social group, any organization or tangible and intangible objects (for example, goods or services). And such student knowledge, skills and abilities are very important to form, as they stand at the beginning of their adult life, their professional path, where they should be effective professionals and successful people. It is also important to form a positive attitude in society to the institution of higher education in General, to the specific higher education institutions, to the student youths as a specific social group, in order to return them to prestige, which was largely lost in the period from the early 1990s to the end of 2010-ies due to the global crisis in all spheres of life of our society and the state and the change of social priorities.

The category of image concentrates in itself ontological elements for reflection of the image content, epistemological elements in the sphere of its cognition process, elements of active action in the field of management of its formation processes. In the individual and public consciousness the attitude to the image is increasingly fixed as to a certain value, which determines the success of life in General and professional activities in particular (Zherebnenko, 2008).

Various aspects of the overall image of students are fixed in the public consciousness and shaped in stereotypes. What is the image of a specific or generalized student what kind of positions represent the image of a student of a particular University influence largely on the process of engaging prospective students, student participation in future projects, the status of the University in the system of higher professional education.

A student in Russian society throughout the history of higher education in Russia has always been a figure that attracted public attention. The image of students always accumulated the latest, often opposition to the existing image, ideological and cultural priorities of a particular historical period. In modern society, the student's image reflects the existing disproportions of the socio-cultural plan, such as a decrease in respect for educated people due to the priority of monetary and material criteria of values, a traditional protest of Russian students against the prevailing socio-political and economic conditions through vivid manifestations of informal, marginal subcultures (Petukhova & Klein, 2014).

Image is very important when applying for a job. First, the novice specialist needs to make a resume that reflects the characteristics of his/her strengths and weaknesses, life position and interests, that is, his/her image as a whole. Secondly, in the process of interviewing a novice specialist will have only a few minutes to provide the potential employer with the most favorable information about his/her business professional competence and personal qualities. The formation of the image of the graduate, the future specialist is also important because the popularity of the University depends on public opinion about its graduates. In addition, the image of the future specialist affects the formation of the professional image of his/her supervisor (Alemasova & Guseva, 2010).

Graduates are a reserve of future social, political, economic and intellectual elites of the Russian state; they are imposed high expectations in promoting the effectiveness of its comprehensive development. In accordance with the modern requirements of improving the quality of the humanitarian component of any professional education, the importance of forming the image competence of students increases (Pak & Yablonskikh, 2016).

Literature Review

2.1. Understanding the Phenomenon of Image in Modern Russian Social Philosophy

In social philosophy, the understanding of the object image as a combination of symbolic and real has been systematically considered within the framework of social ontology. In the phenomenology of the new time, the image was associated with the empirical or rationalistic activity of the imagination of active cognition subject. From the point of view of empiricism, the image is the result of sensual impressions, a print, and a copy of the original object, which is grasped by the mind and remains in consciousness after the termination of impressions. From the standpoint of rationalism, the image is a human thought and a fragment of the infinite world of ideas. The image is an object of imagination in the absence of the original object, which is either a reproduction (memory) or production (creativity) on the basis of the former contemplation of this object. The image of an object is not a vague idea, but a consciously organized form of special attitude, which allows us to talk about its real existence (Azarenko, 2015).

In the philosophical understanding the image is represented as the determination of perception object essence (of things or phenomena) to the otherness. In the image is the identity of the perceived entity and its other existence, implemented as a semantic identity (image, picture) and the actual (an incarnation of the essence in the otherness, sensitive thing). In the process of perception, the consciousness of the perceiving subject acts as an alien for the object of perception. In this case, the image is the result of the identification of the object of perception and non-existence, given as meaning at the expense of the perceived object, its sensual way. The image of the object essence is absolutely adequate to its reality. At the same time, the absolutely incomprehensible essence of the perceived object in the process of self-determination *in itself* manifests itself in Eidos, and Eidos in the process of self-determination *in another* manifests itself in an adequate image, and in some reflexing. These reflexing become concepts (templates) of sensory perception of the object (Taran, 2006).

In philosophy, there are two versions of understanding the image. The first-the image of the object gives a certain idea about it, the idea of one about the other by means of another (sign, symbol), that is, it is a representation after the direct presentation of the object, a representation at the time of its absence. The image of the object gives the illusion of its presence, replaces it. The second-the image not only States the absence of the object, but makes the object to be present at its absence. The image is formed through an intermediary, for example, a writer or a storyteller, but the mediator himself has no power over this image that arises in the mind of the reader or listener, who never directly perceives the object itself. The object in the image is not an object image (Kerimov, 2015).

In modern social philosophy, there are a number of definitions of the image concept:

- the image is not only a product of consciousness, but also something that is formed in a social form as a sign, or even going beyond the boundaries of consciousness, as a simulacrum, and is a force that generates changes and differences (Azarenko, 2015).
- The image is a form of visual representation of information structurally corresponding to the object expressed in it and experienced by a person as a really existing object (Abrarova, 2010).
- the image is a set of sensory signals similar in content to the original object and which are experienced by the subject as the object itself (Rakhmatullin, Semenova & Khamzina, 2012).
- Images are phenomena that synthesize the results of sensory perception and rational cognition in itself. They arise as a result of attempts of practical implementation of theoretical ideas in human activity. In the triad *scientific theory – its transformation – practice* the middle link is the birthplace of the image of the theory functioning in practice and without it the practical realization of the idea is impossible (Yusupova, 2014).

The construction of the image occurs only when the human Self refrains from metaphysical thoughts, judgments and the possibility of a thing existence outside the consciousness which is perceiving it, from the perception of the world as objectively existing (phenomenological era). Then a person begins to look at life as an awareness of the world, and accepts him/herself as a pure Self with a pure stream of reflections. All stereotypes and predetermined positions in relation to the surrounding world and surrounding people are deprived of significance. The world acquires meaning and existential significance from its transcendence, from opposition and interaction with other people, phenomena and artifacts. The image is formed and makes sense for a person in the unity of perception and experience (Shnyreva, 2007).

2.2. Understanding the Phenomenon of image in Modern Russian Social Philosophy

Despite the fact that in the scientific literature, very often the concept of the imagery and the image are used as synonyms, some scientists say that between them in the socio-philosophical aspect, there are fundamental differences: the imagery is the secondary one and the image is primary one relatively to the object; the imagery is passive, and the image has a great impact on the recipient; the imagery is complete and amorphous, and the image is specific and practical; the imagery arises naturally, and the image is formed artificially, the imagery reflects the object holistically, and the image – only the outside. In the modern sense, the image is not just a imagery, which is based on emotional perception, but is a full-fledged information product, purposefully created taking into account objective laws and processes, and becoming more a sphere of scientific activity than art (Doronina & Trubnikova, 2010).

Image is a universal category applicable to any object that is the subject of social cognition. One of the founders of the national imageology V.M. Shepel (2002) defines the image as the appearance or halo of a particular individual, organization or community of people, created purposefully by the media, interested social group or individual efforts of the individual to attract attention. He considers three understandings of image: pragmatic - as a means of achieving a person's specific goals (the American version), personological – as a way to attract attention (the European version) and developing – as conditions for externally fixed internal self-realization of the person (the Russian version).

The phenomenon of image is an immanent property of social existence in phylogenesis and ontogenesis. It is a symbolic system reflecting the totality of social relations and the characteristics of a particular individual. The binary biosocial nature of man is the cause of objective and subjective patterns of image existence. Image is an axiological system that performs the function of a translator of socially significant information. Once this function of the image is recognized by the person, the process of its formation becomes conscious and the image becomes one of the means to achieve the goal (Cheremushnikova, 2002).

Philosophy refers to the image as a phenomenon of reality, which are an area of social cognition and a universal tool of this cognition. Image can be possessed by any object or subject of social cognition. Philosophers understand the image in trinity: a model and a tool of cognition, a form of social management and image. In the General understanding in philosophy there is an understanding of this phenomenon as a stereotypical, emotionally reflected, individual, revealing the internal content, formed in the consciousness of the image recipient, which is a secondary information structure in relation to the perceived real object. At the socio-philosophical level, the concept of image is closely related to spirituality, morality, ethics and aesthetics, which are important in the practical sense as criteria of means and technology of its formation (Simonova, 2012).

In cultural studies, the ontological essence of image is determined by its ability to display the most important aspects of human existence, to form value attitudes and norms of behavior of the individual as a result of the internal resonance of consciousness structures with the symbolic content of the image. The image is the embodiment of the totality of the discourses of the social subject representing its axiological position and optimizing the system for its communications. Image is part of a model of reality that reflects social expectations and allows us to interpret the world within the boundaries of stereotyped significances and meanings (Kuzmina, 2012). In social psychology, from the standpoint of the theory of social representations, the image is interpreted as a specific kind of social representation and as a way of knowing social reality. Image, like any social representation, possesses a communicative nature, collective character, exists in the mass, not individual consciousness, and depends directly on the cultural, historical and social context. It is a dynamic formation, its attributes can be transformed, modified both depending on changes in the image carrier, and on changes in group consciousness. Image performs the regulating function of individuals' behavior (Dagaeva, 2011).

2.3. Understanding of Modern Student Image in Russian Humanities

The image of a University student is a socially significant characteristic of the future specialist associated with the social, personal and professional success of the graduate in various areas of the dynamically changing reality of post – industrial society. The formation of the student's image is determined, firstly, by the social order for qualified specialists, secondly, by the quality of image-forming activity in the educational process of the University and, thirdly, by the student's desire to create and design his/her image, focusing on socially acceptable and professional values of the innovative society (Pak & Yablonskikh, 2016).

The image of the student is an integrative set of presentations, which are represented by verbal or nonverbal signs, expressing personal-individual, socio-psychological and significant for learning and professional activity qualities, the determinants of which are the conscious meaning of professional activity and external requirements, rules and regulations related to this activity (Simonova, 2014).

O.A. Zherebnenko (2014) defines the image of the student as an integral characteristic of the individual, including the synthesis of external characteristics and internal qualities that contribute to the effectiveness of educational activities. The image of the student develops due to the personal need for self-cognition, the level of reflection, awareness of the need to create one's own positive image, and depending on the characteristics of the conditions and content of training. Structural-dynamic model of the student image consists of three levels: constitutional (appearance, gender, age, and temperament), personality (motivational, cognitive and activity-based components of the individual) and social (the status of the University, faculty and the social role of the student and his/her future career) (Zherebnenko, 2014).

The subjective image of a student is defined as the image of his/her developing personality in the form of a system of subjective representations, impressions, opinions formed in the process of perceiving him/her as a subject of educational and professional activities, and as an object of active social interactions. The subjective image of a University student is the result of social perception, has social significance for the object perceiving it and appears when the image carrier (object) enters into social interaction, that is, from the object becomes the subject of its direct or indirect perception (Mukhametzyanova et al., 2016).

There is also such a notion as a professional image of a student, which is defined as a conscious external manifestation by the person of socially significant inherent qualities of the profession. L.I. Savva and E.A. Gasanenko (2015) perceive professional image as a generalized, existing in the mass consciousness the image of a specialist in a specific field of activity, which includes certain values, skills, attributes and qualities and in a certain way influences others. It is formed depending on the requirements for each individual profession, and its main properties are dynamism, awareness, activity and credibility. The functions of a professional image are divided into two groups: value functions (personal uplifting function and feature of comfortization of interpersonal relationships) and process (the adaptation function and the function of shading the negative personal characteristics).

Results

Research in the field of personal image, its essence, formation, functioning, impact on the individual and other people are interdisciplinary and are at the junction of subject areas of social philosophy, sociology, social psychology, cultural studies, pedagogy, Economics.

From the point of view of the socio-philosophical approach, the image is presented in the form of a holistic unity of emotional, ethical, aesthetic and axiological components of its structure. Image plays an important role in the awareness and construction of social reality, performs a meaning-forming function and acts as its specific cultural code in a particular period of development. Image technologies make it possible to activate this code. At the same time, having an image representation of the world and of him/her, a person builds a system of relationships with others and projects his individual social reality. Image is also a tool for forming a harmonious picture of the world on the basis of existing values and norms, as well as for creating pseudo-reality, replacing true values with artificially constructed stereotypes. Image provides a person with identification, self-identification and self-presentation in society.

Therefore, from the socio-philosophical point of view, the holistic concept of image includes understanding it as a multidimensional, technological, ambivalent communicative and managerial phenomenon, which has a symbolic nature, arising as a result of the perception by the individual or group of persons of coded message, contributing to the actualization in their minds and subconscious of the required motives of behavior including the mechanisms of identification, self-identification and self-presentation.

The image of the student has the same characteristics, but also has a number of specific features. Its diversity is determined by the fact that it is formed in the field of contact and interpenetration of the social environment of society and the specific social environment of a particular University with their characteristic maps of the world, values, norms, characteristics of behavior and communication that can both correspond to each other, complement each other and contradict each other. Technological nature lies in the fact that its formation can occur as spontaneously through the subjective perception and evaluation by the student of various material or intangible objects of reality in the process of self-development, and through targeted psychological and pedagogical influence in the process of training and education. Ambivalence is manifested in the fact that the formation of the student's image can be accompanied by a change in the already inherent personal peculiarities and characteristics (strengthening of positive, professionally significant ones and weakening of negative ones from the point of view of the target audience, for example, future employers), and the introduction of new ones either through their real embedding in the structure of personality, either through the creation of illusions about them. Communicatively managerial essence of the student image lies in the fact that its formation in the process of reflection contributes to the formation and development of the individual student on the one hand, and on the other – in the process of image communication has an impact on the opinion of the student about the others that changes him/her and their view of the world, and contributes to the successful socialization and effective professional activity of the student in the future.

Conclusion

The study of the essence and formation of the image of modern students is relevant due to the fact that the modern socio-economic and socio-political conditions of development of Russian society put before higher professional education the task of not only training a competent specialist, but also the formation of personality, the perception of the image of which corresponds to the image of a modern professional in various fields of activity. In the perception of Russian society, the image of students throughout its existence was perceived, on the one hand, very positively, it showed the intellectual potential of our country both in the times of the Russian Empire and in Soviet times. On the other hand, the image of students has always been associated with rebellion, freedom of thought, with the accumulation of new progressive ideas, sometimes in opposition to the existing state ideology and state structure. After the collapse of the Soviet Union, when liberal-democratic ideas became widespread and the economy became market-oriented, those who were able to learn how to earn a lot of money quickly without having higher education became popular in society, and the prestige of students as a specific social group fell sharply. The prestige and quality of higher education fell, as it became possible just to buy a diploma. Now there is an urgent need to return to higher education and students their high social status, which actualizes a comprehensive study of the phenomenon of the image of students and students. Socio-philosophical understanding of the image phenomenon of the modern student as a future professional is also important because it becomes one of the important factors of human competitiveness as a personality and as a professional in all spheres of life activity, and as a social construct, emerging and manifested in the process of social perception and interaction, can be understood through the use of philosophical methods that will allow to study it taking into account new realities.

The article concludes from the socio-philosophical point of view that the socio-philosophical understanding of the image is based on the priority of the subjective over the objective, manifested in the process of transformation of implicit models (symbols) into explicit ones (images), common in the ordinary consciousness of society, their mythologization, and Vice versa. It is established that in recent decades the concept of image is considered from several points of view: as a manifestation of personality, as a means of achieving the goal, as a way to attract attention and as an externally fixed condition of internal self-realization. Image is a concentrated expression of cultural, value and mental meanings inherent in a particular society.

It is determined that from the socio-philosophical point of view, the holistic concept of the image implies its understanding as a multidimensional, technological, ambivalent communicative and managerial phenomenon, which has a symbolic nature, arising as a result of the perception by the individual or group of persons of coded message, contributing to the actualization in their minds and sub-consciousness of the required motives of behavior including the mechanisms of identification, self-identification and self-presentation.

The image of the student has similar characteristics, but also has a number of specific features. Its diversity is determined by the fact that it is formed in the field of contact and interpenetration of the social environment of society and the specific social environment of a particular University. Technological nature lies in the fact that its formation can occur spontaneously through the subjective perception and evaluation of the objects of the surrounding reality in the process of self-development, and through targeted psychological and pedagogical influence in the process of training and education. Ambivalence is manifested in the fact that the formation of the student's image can be accompanied by a change in the already inherent personal peculiarities and characteristics, and the introduction of new ones either through their real embedding into the structure of the personality, or through the creation of an illusion of their presence. The communicative and managerial essence of the student's image is that its formation in the process of reflection contributes to the formation and development of the student's personality on the one hand, and on the other – in the process of image communication changes the image of the world among the image recipients. Adequately formed image contributes to the successful socialization and effective professional activity of the student in the future.

The materials of the article are of theoretical and practical value for the development of educational and methodical complexes on social philosophy, sociology, social psychology and pedagogy, as well as programs aimed at the formation of a positive and congruent image of the student to improve the effectiveness of his/her social, professional and personal adaptation, building the path of his/her successful professional development.

Abstract

The missionary activity among the Zyrians (Komi) with the point of their Christianization was at first connected with the book and the book word. Zyryane turned into the principal nationality in Russia, for which the letter set was composed and the main interpretations of Standard writings were made. The ensuing time of book minister movement did not bring the normal outcomes, since it was completed without considering the eccentricities of the language, culture and conventions of the general population, a mind-blowing states action. Along these lines, the creators of this paper uncover a few plots of evangelist and instructive exercises among non-Russians.

Keywords: missionary activities, language peculiarities, Zyryane

Introduction

The missionary activity of the Russian Orthodox Church among the non-Russian people of the Russian Empire has a long history. Being a multifaceted, certain activities were carried out in different directions, including schooling and within its framework - religious education and book translation.

Missionary schools, designed to train missionaries from local residents, translators, employees of the administration, were elementary type educational institutions for religious missions (Adamenko, 1998). The organization of such schools has become one of the leading missionary activities.

The use of school instruction and the book word for missionary purposes has a long history. Christian enlighteners Cyril and Methodius, as is well known, compiled the Slavic alphabet, made translations of theological works and used them to propagandize Orthodoxy among the Slavic people (Makurin, 2002). Enlighteners in the Slavic lands had pupils and followers. Preaching Christianity and following the example of their mentors, they also turned to the book word (Adlykova, 2003).

The emergence of missionary schools is connected with the history of Ancient Russia. As the Kazan historian of the Russian church, K.V. Kharlampovich (1905), "The Enlightenment of the Pagans with the Christian faith and its reasonable connection with the school of enlightenment of the younger generation (a combination of propaganda of missionary ideas and, moreover, in the language of foreigners, school and book propaganda) is not a new idea. From the time when Christianity appeared in Russia, it was already used at St. Vladimir and his son Yaroslav the Wise, who started schools that had not only a narrow, professional character, but also a broad, missionary one".

However, the given plots were single and not typical. Therefore, we associate the emergence of the first missionary schools in Russia with the name of the Bishop of Perm, Stephen (1901), who spread

Orthodoxy among the Zyryans (Komi). School and book education yielded results. In the region, completely populated by pagans, conditions were created for the creation of an Orthodox diocese, and local clergy cadres were trained (Knyazeva, 2000). But the main thing that should be noted in the activities of Stefan Persmsky (1901) is a careful attitude to the history, culture, traditions and customs of the people, among whom missionary activity was carried out, which brought positive results (Mavlyutova, 2001).

Under successors st. Stephen Christianity spread in the Perm region among the Zyrians and Voguls (Mansi), Stephen's successors in the Perm department - St. Gerasim and sv. Pitirim - have done a lot for the Christian enlightenment of Zyrians. St. Gerasim, according to sources, was killed by the newly baptized Vogulic, and sv. Pitirim died during one of the raids of the Voguli (Rasov, 2002).

The service in the Zyryan language was performed up to the 19th century, however, information about the book missionary activity during the 15th - 18th centuries. We do not have. At least, they could not be found. Most likely, the missionary activity after Stephen of Perm (1901) was limited to the preaching activity and the violent Christianization of the Zyrians (or attempts at violent Christianization).

Methodology of Research

The missionary activities of the Russian Orthodox Church and the religious education of the foreign population in the Russian Empire have long attracted the attention of researchers. General issues of missionary activity received coverage in the studies of M.P. Svishchev (1997), V.Yu. Sofronov (1998). The study of the spread of Orthodoxy in the field of ethnic groups in the Russian state was carried out by A.M. Adamenko (1998), G.G. Gabdelganeeva (2016), V.V. Makurin (2002) etc.

Results

The next stage of the missionary work is associated with the beginning of the nineteenth century. In the late 1790s - early 1800s. the Holy Synod obliged the seminaries on the ground to begin translating liturgical writings into foreign languages. Seminarians from the representatives of the indigenous peoples of the regions were involved in translation activities. As part of this activity, several brochures were prepared and published, including the prayer “Our Father,” a short catechism, and others (Katsyuba, 1998).

Surely, within the framework of the above-mentioned prescription of the Holy Synod, a Zyryan grammar known as “the first printed grammar of the Komi language” was compiled and published. Today "Zyryansk grammar, published from the main department of schools" is considered a rare edition. It is called the Flerov grammar. However, the compiler of the grammar was, according to V.S. Ikonnikov (1891), a student of the Vologda Theological Seminary, Menzensky Zyryanin. Grammar was compiled on the orders of m under the guidance of and with the participation of seminary teacher A.Flerov, this grammar was acquired by the famous Russian statesman and bibliophile Count N.P. Rumyantsev, with whom Metropolitan Eugene was on friendly terms (Ikonnikov, 1891).

In the future, the book and translation activities for missionary purposes continued by the Russian Bible Society. Without touching upon the history of this association and its goals, we will note the colossal work associated with book translation and publishing (Sofronov, 2007). Through the efforts of the Russian Biblical Society in the period to 1823, 57 branches and 232 cooperation committees were established in different regions of the Russian Empire, and the total number of the latter reached soon 289. In addition, in a short period of time, the association published 655,486 copies of books in 26 languages and peoples Russia, bought and received as a gift 49346 copies of books in 15 languages (Shirokov, 2004). The numbers are impressive. They testify to the successful implementation of a focused missionary policy, carried out taking into account Russian specifics, and the book served as the main instrument of this activity.

In total, missionaries published 704831 copies of Holy Scripture in 41 languages. Among them are first translations in 12 languages: Russian, Kalmyk, Karelian, Mongolian-Buryat, Mordovian, Samogit, Turkish (Armenian letters), Tatar, Tatar-Turkish, Tatar-Orenburg, Cheremiss and Chuvash (Scherbich, 2007). The society prepared the Gospel of Matthew for publication in Zyryan dialect (the book was published in 1823), the Gospel was translated into Votskoye (Udmurt), Samoyedy, Kirghiz, Ostyak, Vogul, Mongolian-Buryat dialects. As we see, not only publishing, but also translational activity of missionaries, which was carried out taking into account geographically-geographical, national-ethnic, confessional and other features, was very broad (Fedorov, 1999).

Despite the continuation of translation and publishing activities, the end of the merger was near. By the decree of Emperor Nicholas I, who came to the throne, the activities of the Russian Bible Society were suspended, which was facilitated by the top leadership of the Russian Orthodox Church (Kreidun, 2008). Over 13 years of its activity, the Russian Bible Society has translated and published the books of Holy Scripture in 14 new languages. Among them are the New Testament and the first 8 books of the Old Testament (the Pentateuch of Moiseyev, the Book of Joshua, the Book of Judges of Israel and the Book of Russia) in Russian, the New Testament in Serbian, the Old Testament in Tatar, the Bible in Tatar-Turkish and Tatar Orenburg dialects, the New Testament in Turkish (in Armenian letters), the New Testament in the Chuvash, Mordovian, Mari and Kalmyk languages, the New Testament in the Mongolian-Buryat dialect, the Gospel of Matthew in the Karelian language, the Gospel of Matthew in Zyryan (emphasized by us .M.) And Novobolg rskom languages (Tresvyatsky & Morozov, 2006).

The biblical society became the largest missionary association in Russia in the first quarter of the 19th century, the purpose of which was the religious enlightenment of the peoples of the empire through a book that was viewed as the main tool in spreading Christianity among the "gentiles" (Sofronov, 1998). Another important aspect of missionary activity in relation to our topic is the translation of biblical books into the languages of the non-Russian peoples of the empire, including the Zyryan language, which ensured the use of publications by the population, at least at first. However, in general, such publications, as shown by subsequent years, had no success. The missionaries did not take into account that the population, by virtue of its backwardness, perceived the translations intended for it rather abstractly. In addition, the national traditions, faith and beliefs of the peoples among whom Christianity was spread were strong (Tresvyatsky, 2006). Thus, in relation to this period, we can speak of the failure of the mission, in this case connected with the activities of the British Bible Society.

3.1 Limitation

Questions of Orthodox missionary among the peoples living in North-Western Siberia, the book dedicated to G.Sh. Mavlyutova (2006), “Missionary activity of the Russian Orthodox Church in North-Western Siberia (XIX - early XX century). The author in this work carefully traced the history of the fate of the Oberskaya, Kondinskaya and Surgut missions in the above internality, North-Western Siberia, his beliefs and traditional way of life.

Conclusion

Thus, missionary activity among the Zyrians (Komi) with the aim of their Christianization was initially associated with the book and the book word. Zyryane became the first nationality in Russia, for which the alphabet was written and the first translations of Orthodox texts were made. Thanks to the activities of Stefan Permsky, Zyrians were taught to read and write, were engaged in the correspondence of essays, thereby creating the bookishness of their people (Chumakova, 2008). The subsequent period of book missionary activity did not bring the expected results, since it was carried out without taking into account the peculiarities of the language, culture and traditions of the people, the conditions of their life activity. Some progress in the spread of book-writing culture is observed in the second half of the nineteenth and early twentieth centuries. However, this is a topic for special study.

Acknowledgments

The work is performed according to the Russian Government Program of Competitive Growth of Kazan Federal University.

Abstract

Donation as a social practice is simply starting to frame. Right now, gift as a social practice is a dissipated, divided activities that are precipitously imitated by individuals. Just a couple of actualize gift as a social practice. For this situation, we are discussing dynamic blood givers, that is, individuals who consistently give blood as per an individual timetable, and through which blood gift exists on a lasting premise. There are fears and doubt of individuals in the field of gift, bringing about close to home boundaries that go about as an obstruction to the start of the act of gift among potential benefactors. The absence of instruction programs and the normal publicity and the nearness of General antagonistic useful foundation and the modest number of instances of individuals, who utilize the gift for transplantation of organs, invigorate the rise among the general population of individual boundaries that thus lessens the quantity of benefactors who give blood on an imminent premise. The creators of this paper distinguished the primary social practices of gift. It was recognized by the creators three reasons that urge individuals to be incorporated into the act of gift: the requirement for cash, the longing to help, there was a need to support a relative, and just one motivation behind why individuals are excluded in these practices – dread, which is amazingly hard to adapt to.

Keywords: donation, donation practices, advantages and disadvantages, donors.

Introduction

Donation as a social practice is not the subject of close study of researchers. However, there are a number of papers devoted to the study of donation problems and a number of individual papers on social practices. A.Ya. Ivanyushkin et al. (1998), S.V. Petrov (1999). Since the phenomenon of donation arose in medicine, scientists and specialists in the field of medicine are primarily engaged in its study. There are various medical publications that publish the results of research on the development of donation. Among these publications it is worth to mention the journal of Bulletin of Transplantology and artificial organs, as well as a number of works published in it.

The team of authors: S.V. Gauthier, Ya.G. Moisyuk, O.S. Ibragimova (2009, 2010) – in their work describe the trends in the development of organ donation and transplantation in the Russian Federation for the period from 2006 to 2009. E.P. Volynchik et al. (2009) in their work analyze the quality of life of people after kidney had been transplanted. P.Ya. Filiptsev, Yu.Ya. Romanovsky and R.B. Akhmetshin (2009) in their work raise the issue of using the donor potential of people dying in the intensive care unit, analyze the problems and prospects of its use. The following group of authors T.G. Mikhailichenko et al. (2010) in their work reflected the study results of the psychological status of people who after organ transplantation acquired the disease associated with the transplanted organ.

M.G. Minina (2010) analyzes the organization of organ donation in the territory of the Russian Federation. The team of authors S.K. Sergienko et al. (2010) make a review of modern ideas about brain death, its clinical manifestations and the basic principles of donor accompany – maintenance of breathing and blood circulation, preparation for explantation (organ removal). Other researchers: E.N. Bessonova et al. (2011) describe the experience of creating a waiting list for transplantation of one of the donor organs, namely the liver on the example of the city of Yekaterinburg. E.A. Klyueva, E.V. Spirina and E.B. Zhiburt (2010) as the aim of their research put forward the study of donor satisfaction with donation and motivation to donation among men and women, as well as among people interested in obtaining material benefits and uninterested in obtaining material benefits, taking into account socio-demographic characteristics. V.V. Volkov and O.V. Kharkhordin (2008) contributed to the development of the theory of practices to discover the relationship of practical actions and language. O.V. Kharkhordin (2001), analyzing discourse as a configuration of practices introduced in the scientific turnover a new concept of *discursive practice*. Discursive practices are understood as a set of anonymous historical rules that establish the conditions for performing the functions of utterance in a given era and for a given social, linguistic, economic or geographical space. H. Garfinkel (2007) to study the practical action introduced into scientific use the term *ethnomethodology*. In his work he turns to the study of everyday practices, which he also calls explanatory ones. Individuals carry out practices by means of routine actions, in familiar situations on the basis of knowledge and skills of behavior in these situations, that is, show *competence* and take it as a given. K. Marx and F. Engels, (1970) defined practice as a material, sensory-subject, goal-setting human activity which possesses as its content the mastering and transformation of natural and social objects and which makes the universal basis, the driving force of human society and cognition. Marx also highlighted the structure of practice, consisting of the following elements: need, purpose, motive, subject, means to achieve the goal, and the result of the activity – through which one can learn practical activities. P. Bourdieu (2001) understands under the practice all that the social agent does him/herself and what he/she meets in the social world and which he/she considers as a derivative of hábitus. The very same habitus is a fairly broad term. P. Bourdieu (2001) defines it as, firstly, a system of stable and transferable dispositions, secondly, a system of cognitive and motivating structures, and thirdly, the ability to freely (but under control) generate thoughts, perceptions, expressions of feelings, actions. Habituses function as principles that generate and organize practices and representations.

Materials and Methods

2.1. The Methods of Research

The study of donation is based on the methodology of qualitative approach. Two methods of study were chosen for the study of donation as a social practice: the method of unfinished sentences and semi-formalized interview. The method of unfinished sentences is used as an incentive material for interviews. V.V. Semenova (1998), I.F. Devyatko (2003), G.G. Tatarova (1999), G.G. Tatarova and A.V. Burlov (1997), S. Kvale (2003). In accordance with the purpose and objectives of the study, the target selection of informants is made. The study involved two groups of informants: real donors and potential donors – aged 18 – 35 years.

The study used two methods - the method of unfinished sentences and semi-formalized interview (Elmeev & Ovsyannikov, 1999; Merton, Fiske and Kendall, 1991; Veselkova, 1994, 1995; Ju et al., 2017; Gluzman et al., 2018).

The method of unfinished sentences is a projective technique, the purpose of which is to reveal the subjective, unconscious meanings of the Respondent in relation to something. The idea of this technique is quite simple. The method of unfinished sentences is that the Respondent is asked to complete a series of sentences. This method is most often used as an additional. In this study, the method of unfinished sentences also was used as an additional, namely, acted as a stimulating material for subsequent interviews. For the survey, informants had developed eleven propositions, identifying the knowledge, opinions, and attitudes towards donation

Research problem:

To determine the level of informative nature of informants:

Knowledge of the concepts of *donor, donation*;
Knowledge of the conditions for acquisition of the donor status;
Knowledge of donor rights and obligations (laws, benefits);
Knowledge of places for blood donation (real and potential);
Knowledge of types of donation (except blood donation);
Knowledge of the potential dangers of donation.
To find out the reasons why people become/do not become donors;
To find out whether informants are ready to give / accept a donor gift, why / under what conditions;
To find out whether informants believe that donation is necessary for society, why;
To find out whether informants believe it is necessary to develop the sphere of donation;
To find out the problems faced by donors;
To find out what the attitude of informants to donation is;
To find out what hinders the development of donation;
To find out if there are differences in the answers between the selected groups of informants.

2.2. The Experimental Base of the Research

The empirical research was conducted on the basis of Samara University, faculty of sociology.

2.3. The Phases of the Research

The study of the problem was conducted in three stages:

Stage 1 - development of initial positions on the basis of theoretical analysis of the literature on the subject of research; development of the General concept of research, including methodological principles and the project of development of the research tool.

Stage 2 - development of a research tool to identify ideas about donation among the students.

Stage 3 - an empirical study of the idea about the donation among the students. A sample was formed, empirical data were collected. Preliminary results were obtained. Analysis and interpretation of the results were carried out.

Results

In the unit dedicated to the phenomenon of the donation, the following questions are included: what is the donation and what types of donation except blood donation are known for informants; the risks associated with the donation, according to informants; whether they consider it safe, voluntary, or imposed on; is the informants' attitude positive or negative to the donation; what are the pros and cons of organ donation that can be called by informants. The answers to the question what is donation can be combined into two semantic groups.

The first group includes the answers of informants who emphasize that this is a conscious act of human sacrifice of their organs or blood and its components for another person. For example, the following wording of the response of one of the informants - "donation is a case when a living person gives his/her organ or blood to another in need, or a dying person signs an agreement on the consent to donate their organs to the *donor Bank;* sometimes this decision is made by his/her relatives".

The second group included responses that emphasized that donation was an act of assistance but did not indicate what kind of assistance. For example, the following wording: "donation is when people help each other", "donation is when you are not afraid to help others". However, answering an additional question – what kind of help is it – the informants said that the help consisted in the sacrifice of one's organs or blood and its components for another person. In such a situation, logically, the following question arose- why did some informants, whose answers were within the meaning assigned to the second group, giving a definition of donation, focused only on the fact that this was an act of assistance, without indicating its nature, knowing what it was manifested in? This question was asked to respondents. The answers were quite simple and were reduced to the following phrases – "I see it so", "for me the main thing that people help each other". Such answers were received, perhaps because it is really difficult to explain, perhaps because among the informants were avid altruists with high morals, for whom the act of assistance was really important, regardless of its nature.

Since the study involved two groups of informants-real and potential donors, it is worth noting the existing difference in their responses. In the group of real donors, all informants in the response emphasized the act of donation of organs, blood and its components. And in the group of potential donors, the answers were divided; some of them emphasized the act of providing assistance, and some – the act of donating organs, blood and its components. Most likely, this distribution of responses is due to the fact that real donors are already sacrificing themselves, so the act of sacrificing organs, blood and its components comes to the fore. Why there is a division of responses in the group of potential donors, one can only assume that the emergence of the second type of responses was related to the values or attitudes of individual respondents.

It should be noted that not all respondents were able to give three examples, basically the answers contained either two or one example – "...inconveniently... but there is a sperm Bank...and there is an alternative, that is, a woman can donate an egg cell" or there was a definite answer "sperm". It is necessary to emphasize the fact that many people know about the possibility of donation of germ cells (eggs cell, sperm), and not everyone knows about the possibility of bone marrow donation.

Another feature that should be reflected was the fact that many informants calmly talk about egg cells donation and feel discomfort, which is expressed either in words or intonation, speaking about the sacrifice of male germ cells. Perhaps the feeling of such awkwardness was the reason that some informants did not answer the question, although this does not exclude the fact of ignorance of this kind of information.

Comparing the two groups of informants with each other, it should be said that the informants who did not answer the question were part of potential donors. However, the distribution of responses received did not differ among the groups; in other words, responses containing three, two or one example was present in both the potential and the real donor groups.

Answering the questions posed, our informants constantly emphasized the role of voluntariness in the practice of donation, implying that each person decides to whom (a stranger or a loved one), when and how (what to donate: blood, organ) to help.

Despite the existing freedom of choice, there are ambiguities in the practice of donation. We are talking about situations in which a relative can provide donor assistance to a person, who is under pressure to make decisions, and then there is a natural question – is voluntary donation in such a situation? The informants were described this situation and asked the appropriate question. Content answers of informants differed from each other, but in General they were reduced to the following opinion: if you can help a relative, you should not think about it, you just have to help, and you should not think about voluntary nature of your actions although, if the relatives in a bad relationship - all depends on the nobility of the one who can help. It can be concluded that the fact of voluntariness has a certain distant nature and depends on the relationship between the donor and the person in need of donor assistance (recipient). In other words, if the donor and the recipient are unfamiliar, the option of voluntariness is likely to be implemented, but if the donor and the recipient are in good kinship or friendship, then voluntariness is transformed into altruism. If, however, between the relatives there are bad relations or the degree of intimacy of friends is not great, there is a situation of voluntariness here again.

In the group of real donors, donation is considered safe, arguing that the specialized agencies use sterile equipment and make tests to detect diseases. For example, the following statement can be given: "I believe donation is safe because only sterile devices for blood transfusion or its components are used in blood donation". However, informants from this group do not deny possible health complications. Speaking on the donation of blood and its components, that is, the probability that a donor may faint, nausea or headaches can appear, but because of blood donation takes place under strict supervision of doctors from all symptoms of that kind donors can get rid of. If we talk about organ transplantation, then, according to informants, everything depends on the human body, regardless of whether the organ was transplanted or removed, because in their opinion transplant operations are performed by competent doctors, in sterile conditions with proven donor organs.

The answers in the group of potential donors differ sharply from the responses of the informants from the group of actual donors. First, there is an opinion that it is not safe, for example, there were such formulations as "you cannot be completely sure of everything", "I do not think it is safe." Secondly, despite the fact that informants justify the safety of donation through advances in medicine, for example, "progress in the field of medicine allows you to do it" or "blood is checked for diseases and organs for compatibility", they allow the possibility of medical errors. Speaking about the risks associated with donation, informants of this group noted the possibility of infection as a donor through non – sterile equipment, and infection of someone who will be transfused blood, for example, the following statement can be given - "blood is checked only for the main disease, and if a person is sick with something that is not checked then there is no information about it." Also, the informants talk about frequent cases of infection, about which they have heard from television programs (which are not specified).

The next task, which was set before the informants, was to find the pros and cons of the existence of donation. The number of pros and cons of each Respondent is different, someone could name more, someone less, many of them are the same, and one must say that the difference in the answers among the two groups of respondents was in relation to the cons of donation. Among the advantages of donation, respondents often noted the possibility of self-realization and a sense of pride in helping those who were in need, as well as the possibility of obtaining monetary compensation. Among other advantages, the respondents mentioned-the opportunity to receive a donor gift, the opportunity to save lives, the opportunity to receive the necessary treatment. It was interesting to find out from the informants whether they considered it was necessary to reward donors for their assistance. On this occasion there were different opinions, for example, the followings – "in a good way-no, it's a good thing, and the money is given to at least it made people do it... our world is Mercantile... unfortunately...", "it is necessary to pay only to those who constantly gives blood", "it seems to me, it is necessary to create system of social guarantees because it is necessary to thank somehow the people bringing benefit". Despite the fact that in answering this question there were different points of view, informants agree with the fact that donors should have certain social guarantees, benefits.

This study involved real donors, who found out why they were involved in the practice of donation. We also learned that the primary information about blood donation they received from relatives, friends, and colleagues and eventually in a specialized institution (hospital, blood transfusion center). It was logical to find out what sources of information would be used by potential donors if they decided to join the practice of donation and where they would go to donate it. According to the survey, the following answers were received: "first, I would look on the Internet on sites dedicated to donation, for example, yadonor.ru and everything else will be told to me in the blood transfusion center", "I would ask friends of donors or ask questions in a group of donors in contact", "I would immediately go to the transfusion center, there everything would be learned".

Informants identify three main sources of information about donation – donors themselves, the Internet and blood donation specialists. As for the place of blood donation, the answer was unanimous – the center of blood transfusion.

Discussions

A person who has the status of a donor has additional rights and responsibilities in accordance with his / her status. What are the rights and responsibilities of the donor (blood), according to our informants? In this case, it makes sense to consider the responses of informants by groups, as the involvement of real donors in donor practices, distinguishes them with a greater degree of awareness than potential donors. Speaking about the rights of a blood donor, informants from the group of real donors consider first of all, the right of monetary compensation, telling in detail how much one can get for the delivery of blood and its components. For example, the following statement can be given– "after blood donation, the person receives a sum of money in the amount of 108 rubles to food, as well as about 200 rubles for blood donation, 700 rubles for the delivery of plasma and about 1000 rubles for the delivery of platelets, and in blood donation more than 40 times, or 20 :40 blood and plasma and more, 60 plasma and more, it is about 8 years of the donation, the person can receive the title of "Honorary donor", but it's under the condition that the person will donate blood or its components free of charge, i.e. he will receive 108 rubles to food, but it's nothing compared to the saved life of an absolutely stranger or native person".

Informants talk about a number of social benefits provided by the state to donors. Some informants turn to history and say that over a long period of time social benefits to donors have not changed. For example, here is the following statement – "in Soviet times, a person who gives blood, received a number of pleasant social benefits, compensatory time off, food stamps, money, and with regular donation, quite feasible for a healthy body — the title of "Honorary donor", the right to free travel and a number of other bonuses. In the new Russia, almost all the benefits to donors that existed in the USSR remained, and the need for donor blood did not become less." According to the informants of this group, the duty of blood donors is one-to monitor their health. The same view was expressed by informants from a group of potential donors. Also, according to some informants, the donor should provide donor services as soon as necessary. However, with regard to donor rights, the knowledge of these informants is rather superficial. They know about the monetary compensation for blood donation, but what is the amount of this compensation they do not know. Also, informants assume that there are certain social benefits, but what they cannot say.

The benefit of donation is mostly in the possibility of self-realization, in the sense of pride and satisfaction for helping people in need, in the participation in saving the lives of many people. The effect of satisfying a person's need for self-realization is much higher than satisfying a person's need for money.

Thus, the donation brings benefits to man in moral and emotional terms. In people's minds, donation, as a rule, is one of the varieties of forms of altruism, that is, unselfish help.

Conclusion

Thus, according to the results of the study, the following conclusions can be formulated:

Informants are familiar with the concept of donation and donor, they relate them to common definitions, and importantly, the answers of informants do not differ from each other. An important point is the fact that all informants emphasize the voluntary nature of donation and the altruism manifested in it.

Informants are familiar with the basic possibilities of donation, namely what organs and tissues can be donated or obtained, and with the potential dangers. But the knowledge of our informants on this issue is incomplete and fragmented and informative nature is higher among informants included in the practice of donation.

According to the results of the survey, there were three reasons for stimulating people to be included in the practice of donation – the need for money, the desire to help; there was a need to help a relative, and only one reason why people are not included in these practices – fear, which is extremely difficult to cope with.

Speaking about the problems of donation, first of all we think about people who sacrifice themselves for the benefit of others, that is, donors. However, we can say that the involvement in donor practices is twofold. The person may engage in the practice of organ donation is not only due to the fact that he becomes a donor, but due to the fact that he becomes a man who received a donor gift, for the donor always sacrifice for someone else. And it would be unfair to speak only about donors in such a situation, since the person receiving the donor gift also experiences certain difficulties, which cannot be ignored.

We can talk about the existence of some distance in the desire to provide or receive donor assistance. That is, the closer a person is to us, the more we are ready to give or receive (willingness to donate an organ), if a person is not familiar to us, then we can share with him only what can restore the body, for example, blood.

Despite a number of negative aspects and awareness of the dangers of donation by informants, in General, they positively assess the sphere of donation and consider it necessary to further develop and improve it.

Informants are aware of the need for the existence and development of the sphere of donation, but are not ready to be involved in donor practices. A rational assessment of the phenomenon of donation shows only that people understand the need for its existence and with the favorable development of this sphere they will begin to support it. However, when it comes to presenting yourself as a donor or a person who needs donor assistance, the informants have internal contradictions.

Donation as a social practice is just beginning to form. At the moment, donation as a social practice is a scattered, fragmented actions that are spontaneously reproduced by people. Only a few implement donation as a social practice. In this case, we are talking about active blood donors, that is, people who regularly donate blood in accordance with an individual schedule, and through which blood donation exists on a permanent basis.

There are fears and distrust of people in the field of donation, resulting in personal barriers that act as a barrier to the beginning of the practice of donation among potential donors.

The lack of education programs and the regular propaganda and the presence of General negative informative background and the small number of examples of people, who use the donation for transplantation of organs, stimulate the emergence among the people of personal barriers that in turn reduces the number of donors who donate blood on a prospective basis.

The low interest of the state in the development of this sphere, the lack of a solid, clear and unambiguous legislative framework, largely inhibits the formation of donation as a social practice.

There are fears and distrust of people in the field of donation, resulting in personal barriers that act as a barrier to the beginning of the practice of donation among potential donors. The lack of education programs and the regular propaganda and the presence of General negative informative background and the small number of examples of people, who use the donation for transplantation of organs, stimulate the emergence of people's personal barriers that in turn reduces the number of donors who donate blood on a prospective basis. The low interest of the state in the development of this sphere, the lack of a solid, clear and unambiguous legislative framework, largely inhibits the formation of donation as a social practice.

Donation in our country is just beginning to develop, so it is a wide field of opportunities for study. Practices involving both donors and recipients can be explored. Direct experience of donors is the number of donations (blood donation), feelings, intentions, motives, goals. It is interesting to study the lives of people who received a donation, especially if this gift was an organ – how a person lived before there was a need for donor assistance, what a person felt when he learned about the need for transplantation, what difficulties he/she faced up in the process of treatment, how life changed after transplantation. It is interesting to study donor dynasties, that is, families where the acquisition of donor status is a tradition. Depending on the objectives of the study, different methods can be used to study donation: questionnaire survey, interviews, various projective techniques, to obtain more detailed information, a combination of different methods is necessary.

Abstract

The investigation affirms the hypothetical and down to earth significance of academic substantiation of social paradigms as a perpetual condition for the improvement of culturally diverse connection skills of a global understudy in the instructive space of the College. It is demonstrated that the cutting edge image of the world, changing affected by worldwide relocation forms, from new positions uncovers the highlights of this issue in secondary school, requiring fast, innovative and compelling arrangements from all subjects of the instructive space. Over the span of the investigation, the significance of reexamining the instructive states of the procedure of global understudies preparing and their reorientation from the data and psychological bases to the hypothetical and efficient reason for the execution of culturally diverse collaboration abilities in uncommonly composed states of the instructive space of the College is resolved. Based on the got outcomes, the benefits of character decided, prototype lattices of culturally diverse communication of a global understudy in the instructive space of the College are characterized: self-ruling, restorative collaboration and merging conduct are resolved. The elements of lattices' advancement is described by signs of individual mimicry's structures, between coordination of universal understudies with instructors, individual understudies to solidifying conduct, joined by the development of grids of social originals. The networks in this procedure are the consequence of the complexation of social and worth parameters of the instructive space and the examples of social paradigms of a worldwide understudy going into collaboration with it. In such manner, this article sets up the highlights of hypothetical and deliberate way to deal with the projection of significant worth images of social prime examples of a worldwide understudy on the improvement of diverse association abilities in the instructive space of the College.

Keywords: Multifaceted communication, competency international student, the fixed nature, monitoring, algorithm.

Introduction

1.1. Relevance of the Research

The modern picture of the world, dynamically changing under the influence of globalization, has affected not only the forms of cultures, but also the types of their perception and interpretation by student Youth. As a result, global homogenization, interpreted by them as the unification of the material sphere of cultures, revealed differences both in the historical dynamics of values and in their hierarchical structure and caused a crisis in their understanding. It is proved that the predominance of the globalization type of culture, as a multi-culture, becomes for the student's personality, to a greater extent, an internal expression of territorial changes. Under these conditions, the appeal to the cultural archetype as a way of preserving one's own belonging to the unique national culture of the native society is a natural response of the student to global challenges. It is proved that these trends indicate, the strengthening of the role of the archetype as a permanent (ever – ending) symbol (image) of national culture in the trans-territorial communication and in the process of formation of a new cultural landscape on the one hand (Mamonova, 2013) on the other hand, determine the behavior of international student in cross-cultural interaction in educational space of the University, providing him/her with all necessary resources for comfortable learning (Vdovushkina, 2009; Galsanova, 2011; Koshetarova, 2010). The established trends are present at all levels of the educational process and are manifested as an indispensable condition for the success of international students in the assimilation of the current and future educational goals and objectives, for the effectiveness of the personal and professional development (Giddens, 2004; Crane, 2002; Madsen, 1993; Robertson, 2002). In the course of the study, the importance of rethinking the pedagogical conditions of international students' training process and their reorientation from the information and cognitive bases to the theoretical and methodical basis for the implementation of cross-cultural interaction competencies in specially organized conditions of the University educational space is determined. On the basis of the obtained results, the advantages of personality-determined, archetypal matrices of cross-cultural interaction of an international student in the educational space of the University are determined:

– Autonomous interaction. It manifests itself in the form of personal mimicry, adjusting to the conditions of a new society. Students are involved in the processes of communication and behavior, according to the existing standards in the University. At the same time, they preserve their own cultural identity and demonstrate the rejection of the values of the new environment. There is no cross-cultural interaction between students who come into contact. International students remain isolated from the influence of the dominant society;
– Correctional interaction. There is a gradual awareness process of the inappropriateness of demonstrative behavior and the values' rejection of the educational space and the new society, the understanding of such behavior as a sign of bad manners. At this stage, there are changes in socio-cultural patterns of student behavior. There is a *corridor* for dialogue of cultures in cross-cultural interaction and mutual coordination of international students with teachers and fellow students;
– consolidating behavior. This is the origin of the matrix-the result of the complexation of cultural and value parameters of the educational space and the patterns of cultural archetypes of an international student entering into interaction with it. The matrix contributes to the development of cultural identification of students with new values based on the preservation of their own ethnic and cultural identity. As a result, the basic values of the student's personality change. In the process of borrowing the values of the new environment, the structure of archetypal value matrices is modified. Without violating the integrity of cultural belonging, the new symbols allow reaching the level of cross-cultural interaction based on universal values. At the same time, students rely on the competence of self-identification with the values of the educational space as a micromodel of a new culture; their consciousness opens to new meanings and values of the surrounding space (Galsanova, 2011).

In this regard, the priority attention in this article is given to the establishment of theoretical and methodical approach to the projection of cultural archetypes' value symbols of an international student on the development of cross-cultural interaction competencies in the educational space of the University. The article reveals the structure and content of the concept of cultural archetype's *permanent nature* of a foreign student; the structure and content of cross-cultural interaction competences of an international student in the educational space of the University are defined. On the basis of the research results the pedagogical algorithm of projecting the value symbols of cultural archetype on the development of cross-cultural interaction competences of an international student is substantiated and its effectiveness is proved with the help of motivational, cognitive, operational, personal criteria.

1.2. Analysis of the Literature

Scientific – methodical ideas and insights of philosophers, sociologists, psychologists, educators, Methodists (Allakhverdov & Allakhverdov, 2014; Bolshakova, 2010; Vdovushkina, 2009; Galsanova, 2011; Zabiyako, 1998; Koshetarova, 2010; Crane, 2002; Madsen, 1993; Robertson, 2002), devoted to the development of General cultural competence of international students in educational space of the University, constitute the methodological basis of this study. Of particular importance for the study of the problem of research are the works of K.G. Jung (2004), thanks to his theory of the collective unconscious, the concept of archetype is actively used in modern research. K.G Jung (2004) stressed that the term *collective* indicates the *universal nature* of this layer of the unconscious in the psyche of the individual, the identity of this layer in all people. Archetypes as *collective patterns* in Jung's theory are endowed with specific properties: non-representability, as the ability to form the possibility of representation, which is given a priori; affectivity of nature: since affective situations are typical, resulting in the formation of the same archetypes;

ambivalence nature, because they are derivatives of the dual nature of the human psyche (fear and awe, horror and delight – feelings experienced in connection with archetypal images); archetypes are not relics of the past, they play a regulatory role, perform compensatory functions, enable adaptive instinctive actions' performance. In his research, Jung K. defined the role of archetypes in determining the fate of not only an individual, but also entire societies and States. In his opinion, all the most powerful ideas and representations of humanity can be reduced to archetypes (Jung, 2004). The polystylism of cultural forms, values, norms, behavioral imperatives, manners of goal-setting presuppose the emergence of an intercultural neutral space that removes the contradictions of interacting cultures, expands the diversity of cultural styles and ways of their presentation and interpretation. According to Jung K., cultural archetype is a step into the past, a return to the archaic qualities of spirituality, but the strengthening of the archetypal can be a projection into the future too, providing individuals with opportunities for adaptation to foreign cultural external zones. In the psychological and pedagogical literature the leading idea of priority of creating safe educational space of higher education institution for development of cross-cultural interaction competences of the international student is traced. Many researchers (Vadutova, Kabanova & Shkatova, 2010; Gladush, Trofimova & Filippov, 2008; Dementieva, 2008; Domorovskaya, 2007; Savchenko, 2010) on the basis of the results obtained note the changes of adaptability in different ethnic groups of students depending on the level of formation of cross-cultural interaction competences in educational space of the University. To date, the study of a foreign student's adaptation, due to the cross-cultural interaction of the value symbols, of the national culture's images as a leading strategy for improving the educational space, have special significance (Gladush, Trofimova & Filippov, 2008; Crane, 2002; Robertson, 2002; Fursa, 2012). In recent years, in pedagogical studies devoted to the problems of cross-cultural interaction of an international student in the educational space of the University, much attention is paid to the cultural models of archetypes, the methods of their organization and application are proposed, the advantages of use are identified, the requirements for design are determined (Galsanova, 2011; Kolcheva, 2015; Zabiyako, 1998). In the course of the study, despite the extensive bibliography, the presence of productive areas and approaches to the development of intercultural interaction competences of an international student in the educational space of the University is established; the questions of creating new forms and models, new resources of implementation remain open. The leading role in this process is played by models of cultural archetypes of the student, the permanent values of which are the matrix of available experience, the use of which depends on the process of intercultural communication. In this regard, the need to determine the theoretical and methodical approach to the projection of the archetype's value symbols on the development of cross-cultural interaction competences of an international student in the educational space of the University is still relevant. The solution to this problem determines the purpose of the study.

Results

2.1. Discursive Content of the Notion Permanent Nature of Cultural Archetype

It is established that cultural archetypes are more ready-made, historically formed representative cultural forms, symbols, models that allow explaining the available experience of a person; it is the ability to form the possibility of representation, which is given a priori. K. Jung's statement, comparing the archetype with the axial system of the crystal, reshaping the crystal in solution, acting as a field distributing the particles of matter, became popular. Actually it just needs to be distinguished from the image, as a synonym of which Jung used the terms *archetype* and *elementary image* (Jung, 2004). It is proved that initially the concept of cultural archetype in scientific research is used as a methodological approach in the study of art, as the main situation, character or image, constantly present in human life, because a person cannot live without archetypes, as without nature, and the human community does not live without rites and traditions. In modern literary studies there is an understanding of archetype as a universal plot or prototype, fixed by myth and passed from it to literature and other types of professional art. Since literary experts themselves mark the second nature of literary archetypes in culture, other researchers define the archetype as the main force, character or image that is present in the life of a person constantly (Bolshakova, 2010). According to the definition of A.Yu. Bolshakova (2010), cultural archetypes are: 1) the most stable in historical changes and determining the structure worldview of the individual, nation, people, meta concepts of culture; 2) the invariant core of human mentality, changing in accordance with the specific historical situation, in the resistance to it and in adapting to it. Considering the archetype as a meta concept of culture, it is possible to establish its properties:

- invariance of the archetype. It suggests a mental expansion of the primary model, which determines the variability of its incarnations in culture and peculiar evolution;
- Convolution. The original form of the archetype's existence as a cultural symbol to keep in minimized form extensive and significant texts. Every cultural archetype has this property;
- Binary nature of the structure. It forms antinomy archetypal models (dying/rebirth, good/evil, etc.). This feature of the archetype is based on the psychological views of K. Jung, who discovered the ambivalent nature of the archetype of the collective unconscious;
- There are passive and actual layers in the structure of cultural archetype. Actual one differs by historicity, national color, as it is determined by the cultural context. Passive acts as an invariant kernel, forming a *through* image-type (Bolshakov, 2010). In the science of the XX century the concept of archetype became widespread and interdisciplinary due to extraordinary geopolitical and migration processes. K. Jung noted that the archetype is stable and has the ability to repeat throughout history wherever fantasy freely operates. Archetypes, preserved in the form of collective unconscious inherent in each individual, are the result of centuries of our ancestors' experience. They are inherited in the same way as the structure of the body is inherited. Archetypes define the identity of the General structure and sequence of images that pop up in the mind in the awakening of creative activity, so spiritual life bears the imprint of the archetypal nature. K. Jung, exaggerating the role of archetypes, saw them as a formative beginning, present in the psyche of each person. He was convinced that archetypes structure the understanding of the world, of themselves and other people; they manifest themselves with special clarity in mythical narratives, fairy tales, dreams, as well as in some mental disorders. The set of archetypes is limited; they are the basis of creativity and contribute to the inner unity of human culture, make possible the relationship of different eras of development and mutual understanding of people.

Archetypes in this sense are hypothetical; represent a kind of model that allows explaining the available experience. Within each ethnic group archetypes acquire their own form (archetypal ones are and the cross, and mandala). Archetypal ones are *eternal images* (Christ, the Virgin Mary, Muhammad, and homeland, Life, Good and Evil). Each nation, refracting the archetype through its lifestyle and the picture of the world, gives birth to the most characteristic of their spirit images and ideals. The ethno cultural archetypes are represented by the historical and socio-cultural experience of the people and their spiritual orientations. It is proved that the use of the established characteristics in the creation of cultural archetypes' semantic constructs of an international student as a set of symbols, images and ideas that exist in the realities of culture and are expressed in value matrices, is applicable in determining the behavior of the student in the everyday situation of a particular cultural environment, and in extraordinary situations.

2.2. The Structure and Content of Cross-Cultural Interaction Competence Package of an International Student

The dominant characteristics of cross-cultural interaction competences of an international student, based on the symbols and ideals of the archetype, as a permanent condition for the preservation of national identity and identity of the culture of the individual, are: motivation for their assimilation, as a willingness to use; possession of the necessary knowledge; experience of application in standard and extreme conditions as an activity-based aspect; value attitude to the object of the application; emotional regulation of the process and the result of the application. The established characteristics have a supra-professional character and are present in any activity, but in relation to the development of cross-cultural interaction competencies, they show specificity due to the values of cultural archetypes and the implementation of the principles of cross-cultural communication, self-organization and self-transformation. In this innovative process the competencies of inter – cultural communication, value-semantic orientation, self-improvement, social interaction are applied. It is determined that the structure of intercultural interaction competences is differentiated on the same grounds as the values of cultural archetypes on the key ones (they are implemented on a universal, common for all archetypal models the content of values), cross-cultural (they are implemented on the content of cultural values, universal for the set of archetypes), cultural (they are formed within the boundaries of a particular cultural archetype). The established differentiation determines the composition, structure and content of cross-cultural interaction competences inherent in a particular archetype:

- Personal competence, are focused on the person as a personality, the subject of activity, communication: competence of value-semantic orientation; competence of civic consciousness; competence of integration (structuring of knowledge, expansion, increment of accumulated knowledge); competence of self-improvement, self-organization, self-development, personal and subject reflexing;
- Communicative competence related to human and social sphere interaction: competence of social interaction; social mobility; competence of communication (oral, written): construction and perception of the text, cross-cultural communication, interaction with others;
- Personality – activity-based competency: the competency of the educational – cognitive activity; the competency of the operational – practical activities; competency of information technology; adaptation competency; remedial competencies.

The structure and content of the competencies established and conditionally grouped in the course of this research possess the properties of meta-subject, interdisciplinary and subject character. Meta-subject level involves social and professional knowledge, skills and personality traits of an international student – future specialist, which have a universal character. The interdisciplinary level is based on interdisciplinary communication, modeling solutions that require collective interaction, the development of competencies for the rapid assimilation of non-core disciplines. The subject level is mediated by the content of the studied disciplines and at the same time the content of competences mediates and modifies the cultural values of educational knowledge.

Designing the competences of cross-cultural interaction of an international student, based on the symbols and ideals of the archetype, as a permanent condition for the preservation of national identity and identity of the culture of the individual, requires a well-thought-out structure, determining the objectives, determining the relevance of the study for all participants, the social significance of the relevant methods, including experimental work, methods of processing the results. These competencies are fully subordinated to the logic of development of cross-cultural interaction competences and have a structure, approximate or completely coinciding with the values of cultural archetypes.

2.3. Pedagogical Algorithm of Projecting the Value Symbols of Cultural Archetype on the Development of Student Cross-Cultural Competencies

It is established that the development of cross-cultural competence of an international student, based on the values of the cultural archetype, is a pedagogical system based on a variety of interrelated elements: goals and objectives, laws and principles, content, organizational forms, methods and tools, technologies, criteria of readiness of the system to implement the process of development of competencies and indicators of readiness of an international student to specific types of interaction in the educational space of the University. The algorithm for the development of cross-cultural competencies on the symbols and ideas of the cultural archetype based on the relationship between motivational, cognitive, operational and personal levels is justified (Vdovushkina, 2009; Zimnyaya, 2003; Kolcheva, 2015; Khutorskoy, 2003).

The *motivational level* assumes the primary formation of the international student's motives that cause activity and determine its *direction* - interests, motives, abilities, needs, views, positions, attitudes.

The *cognitive level* involves the acquisition by the person of knowledge, the development of intellectual abilities and abilities to apply the knowledge in practice.

The *operational level* is focused on the formation in international student of the necessary package of competencies.

The *personal level* is based on the formation of personally significant competencies necessary for the realization of the values of cultural archetype in cross-cultural interaction in the educational space of the University.

The experimental verification of the established approaches shows that the scientifically grounded implementation of the algorithm for cross-cultural competences development based on the symbols and ideas of cultural archetype is effective if the basic archetypal matrices are used in the creation of semantic constructs of student's behavior in the educational space of the University:

– at the motivational level - as appropriate motives, needs and goals of cross-cultural interaction; understanding of the personal and social significance of the results of activities for him/herself and ethno-cultural society; world views on the personal responsibility of activities; intentions and attitudes to educational activities; social preferences and expectations of the future professional activity; the position of a person of national culture in relation to him/herself (recognition of him/herself as a person of national culture, the desire for self-development and self-improvement as a future professional);
– at the cognitive level-as a reflection: 1) completeness, depth, stability and systematized nature of knowledge about the socio-economic and socio-political situation in their own country, in the host country, in the professional sphere, awareness of its specifics and the main development trends, the tasks set by their own state to each citizen; 2) requirements of this type of labor activity to the personality of the future specialist; 3) formation of special knowledge about the features of professional activity: corporate culture; psychology of interaction with fellow students, about human values, professional and ethical standards and rules of communication and behavior; abilities and readiness for further self-education in cross-cultural interaction;
– at the operational level - as the formation of competencies: 1) *General professional* (to define strategic goals of activity and to organize their realization; to analyze efficiency of the carried-out activity; to distribute functional powers and responsibility; to develop system of the current and operational control; to operate collective and to activate participants in the course of the solution of objectives; possession of methods and receptions of forecasting of changes in the processes occurring in external and internal environments); 2) special (to use knowledge of *cognitive* processes' mechanisms in activities, for example, to improve the simulacrum of PR campaigns and advertising; to apply business communication *skills* in professional activities; to find optimal strategies of behavior in conflict situations; to apply the skills of effective *goal-setting* in the planning of activities; to highlight the main patterns of behavior in the planning, organization, motivation, control);
– at the personal level - as a willingness to implement: 1) moral qualities (diligence, perseverance, organization, discipline, responsibility, commitment, independence, inner freedom and self-esteem, self-discipline); 2) Professionally significant skills (commitment and ambition, determination, courage, swiftness, energy and perseverance, intuition, endurance and *self – control*, ability and willingness to risk); corporate skills (*communication skills*, culture of interaction with colleagues, clients, investors, team building culture).

Variants of behavior of the international student in extraordinary situations of cross-cultural interaction competencies realization corresponding to values of cultural archetype are proved.

Option 1. Familiarity with the environment:
– Difficulties of language communication;
– Climatic surprises;
– Problems with the wardrobe;
– Problems with transport;
– Change of hour rhythms.

Option 2. Analysis of educational space:
– Social and living conditions;
– Psychological climate in the interethnic study group;
– Communication with representatives of other countries and daily training activities;
– Attitude to group norms, goals and values;
– Development of behavioral tactics corresponding to the group requirements and expectations.

Option 3. Analysis of living conditions:

- Adaptation to campus life;
- Adaptation to the norms of behavior in society, in the study group;
- Adaptation to the requirements of educational activities;
- Difficulties of getting used to another way of life;
- Difficulties of getting used to another climate;
- Difficulty getting used to a different kitchen
- Difficulties in relationships with others;
- Difficulties with the absence of relatives.

Option 4. Identifying opportunities for cross-cultural interaction.
Option 5. Identification of personal and socio-cultural barriers.
Option 6. Determination of priority personal qualities necessary for cross-cultural interaction with others:

- forecasting the goals of cross-cultural interaction;
- Definition of socially significant competencies;
- Status in the study group, by place of residence;
- The commitment and level of ambition.

Option 7. Formation of optimistic expectations.
Option 8. Determination of the directions of search for new opportunities in cross-cultural interaction in the educational space of the University.
Option 9. Correction of cross-cultural interaction competencies.
Option 10. Creation of new symbols of cultural archetypes based on the integration of national value matrices with values of other cultures.
Option 11. Search for new opportunities.

Conclusion

The study confirms the theoretical and practical importance of pedagogical substantiation of cultural archetypes as a permanent condition for the development of cross-cultural interaction competences of an international student in the educational space of the University. It is proved that the modern picture of the world, changing under the influence of global migration processes, from new positions reveals the features of this problem in high school, requiring rapid, creative and effective solutions from all subjects of the educational space. In the course of the study, the importance of rethinking the pedagogical conditions of the process of international students training and their reorientation from the information and cognitive bases to the theoretical and methodical basis for the implementation of cross-cultural interaction competencies in specially organized conditions of the educational space of the University is determined. On the basis of the obtained results, the advantages of personality-determined, archetypal matrices of cross-cultural interaction of an international student in the educational space of the University are defined: autonomous, corrective interaction and consolidating behavior are determined. The dynamics of matrices' development is characterized by manifestations of personal mimicry's forms, inter-coordination of international students with teachers, fellow students to consolidating behavior, accompanied by the emergence of matrices of cultural archetypes. The matrices in this process are the result of the complexation of cultural and value parameters of the educational space and the patterns of cultural archetypes of an international student entering into interaction with it. In this regard, this article establishes the features of theoretical and methodical approach to the projection of value symbols of cultural archetypes of an international student on the development of cross-cultural interaction competencies in the educational space of the University. The article reveals the structure and content of the concept of *permanent cultural archetype* of an international student; the structure and content of the competencies of cross-cultural interaction of a student in the educational space of the University are defined. Based on the results of the study, the pedagogical algorithm for projecting the value symbols of cultural archetype on the development of cross-cultural interaction competences of an international student is substantiated and its effectiveness is proved with the help of motivational, cognitive, operational and personal criteria. This problem as a research area is not limited to the solution of the goals and objectives. The substantiation of the model of integration of the traditional educational process's cultural archetypes with the matrices of the cultural archetype's values of the innovative (virtual) educational process is important for the formation of the personality of an international student.

Antinomic Dialectics as a Methodological Tool for Solving Paradoxes of Love in A.S. Makarenko Juvenile Pedagogy

Nikolay K. Chapaev, Olga B. Akimova and Evgenij M. Dorozhkin
Russian State Vocational Pedagogical University, Ekaterinburg, Russia

Teaching to love, teaching to recognize love, teaching to be happy – means teaching to respect yourself and teaching human dignity.
Anton Makarenko

Abstract

The problem under study is urgent due to existent contradiction between the growing need for the development of an adequate heuristic tool for studying the educating problems of the younger generation, on the one hand, and ignoring the rich positive experience of Makarenko juvenile pedagogy, on the other. On a broader, ontological basis, the study is relevant due to the polymodalization processes of the all aspects of human activity and human existence, which in its turn call for the development of an integral multidimensional human. The multidimensional human is oriented to the plurality recognition of truths and ideas about the world, capable of solving the growing shaft of problems, devoid of one-dimensional and unambiguous direction.

The paper is aimed at scientific identification and legitimation of antinomical pedagogy. On this basis its tool opportunities are disclosed using A.S. Makarenko experience for solving love conflicts-paradoxes in juvenile educational environment.

The main approach to study is an antinomic principle. This allows us to consider opposites as necessary equal components of a certain holistic process (phenomenon) and suggests ways of adapting to them.

The following results are obtained in the study. Firstly, the essential, substantive and instrumental characteristics of the antinomic dialectics are established and scientifically substantiated. Secondly, mechanisms for realizing its methodological potential in Makarenko educational system. Thirdly, some problems and perspectives of the study of antinomy as a pedagogical and educational phenomenon are indicated.

The materials of the article can be useful in modeling, designing and developing modern younger generation education systems, and also as a heuristic tool for studying the problems of development and improving antinomical pedagogy.

Keywords: Antinomies, antinomic dialectics, antinomical pedagogy, juvenile (adolescent-youth) pedagogy; the pedagogy of love; teacher as a top manager.

Introduction

Philosophers consider antinomy as "... a contradiction formed by two judgments (inferences, laws), each of which is recognized as true" (Gritsanov, 1999). Thus, the semantic dominant of the category under discussion is a contradiction. Consequently, there is reason to believe that antinomy and dialectics correlate. Dialectics is a science of contradictions, the unity and struggle of opposites, the universal laws of the development of nature, society, human and thought (Frolov, 1991).

This, in a sense, leads us to legitimize the existence of antinomic dialectics. In addition to its dialectic filling, antinomic dialectics includes as its heuristic basis the principles of similarity in difference and difference in similarity, and antinomies. According to the first principle, relation of opposites is not dialectical negation of each other, but is harmony and similarity (Malakhov, Filatov, 1990). The second principle complements the first one. In addition to recognizing the equality and equivalence of polarities, it suggests ways of adapting to them.

In their totality, these principles express the essence of the so-called "balancing thinking" (Yarkina, 1992), which forms the heuristic foundation of the antinomic dialectics. However, as it will be seen from below, the antinomic approach does not completely reject the ubiquitous law of the hierarchy (as for example, two-factor approach). Figuratively speaking, one of the opposites, as a rule, is more equal.

The concept of "antinomic dialectics" is by no means the invention of the author of this article. We refer to the article by Gaidenko (1988) "P.A. Florensky antinomic dialectics against the identity law". The interesting is that this work especially emphasizes the statement of P.A. Florensky about the moral, ethical and, to some extent, even the love side of the antinomic dialectics issue. According to Gaidenko, the entire Florensky antinomic dialectics is based on the conviction that the rejection of selfishness and self-assertion presupposes a rejection of the identity law. It is further asserted that the love to the other, according to Florensky, demands the renunciation of the identity law, the abolition of it. This is supported by the thesis (Florensky, 2017) that the of *identity law* is a synonym for egoism, callousness, lack of love and the skoptsy mind, while *antinomy* is synonymous with altruism, love, faith and creativity.

The intentions of antinomic dialectics are applicable to the modern education. For example, the its direct pedagogical consequence is the concept of a holistic school, developed by German scientists (Winkel, 1988). Its core is the proposition that the universe has paradoxical antinomic properties, suggesting the coexistence of opposing and mutually exclusive ways of being - randomness and necessity, order and chaos, activity and rest. This allows to more accurately deal with such issues as, for example, relationship between the individual and the collective. It contributes to the recognition of the need to build a qualitatively new system of interrelations between organizations and their environment, nature and human down to their subject-object fusion. The latter is determined by the comprehension of the integrating sense of nature as an indivisible triad consisting of the subject, the object and the integration process that takes place between them. Ultimately, this leads to the realization of the idea of a person's global openness to nature, to taking into account all aspects of life in all its diversity in educational activities, to the realization of the need for global cooperation and co-creation of human and nature, a person and a person, and a person with himself (Yarkina, 1992; Chapaev, 2005).

The heuristic power of Makarenko's antinomic dialectic fully manifested itself in his concept of love. If we look at the consolidated subject index, presented in the last volume of A.S. Makarenko collected works on page 550, we will see that love is not a passing word, but a very significant category that permeates the entire structure of his educational system. In this respect, Makarenko's response to one of the questions asked him when speaking at the Kharkov Pedagogical Institute is characteristic: ‘I decided to write a love book, because I involuntarily became an expert in this matter (Laughter in the hall), although I came to this persuasion at the most recent time that love is not at all an influx or a chance, nor an accident, but this is an ordinary case that needs to be organized. Therefore, educating good organizers, you thereby ... bring up good lovers’ (Makarenko, 1958, Vol.5, pp.297-298). As they say, no comments. A.S. Makarenko distinguishes four types of love: love for the home country, love for parents, love of parents, love properly, concerning relations in juvenile environment.

We included the phrase "*paradoxes* of juvenile pedagogy” in the title of the paper. At first glance, it may seem a bit dubious to use it in the topic. *Paradoxes* look somewhat frivolous alongside such an important and at the same time mysterious category as the antonymic dialectics. But this is only at first glance. Paradoxes are by no means lightweight and not far from the concepts of "antinomy" and "dialectics".

Both in Russia and abroad, not infrequently the concepts of "contradiction", "paradox" and "antinomy" are considered synonymous (Getmanova, 1998). From this we also started when considering the paradoxes of love and the ways of their resolution in the A.S. Makarenko system. As for the notion of A.S. Makarenko "juvenile pedagogy", then in this case we proceeded from the simplest interpretation of it as a direction in pedagogy, designed to solve the tasks of raising children from about 12 to 18 years, which coincides mainly with the age of the pupils of Makarenko. Speaking about “juvenile pedagogy”, we mean only that, but nothing else.

2. Methodological Framework

2.1. Research methods

In the study, to different extents, the following methods were used:

- hermeneutic (interpretation, comprehension, understanding);
- analysis and synthesis, concretization and generalization, universalization and unification, transformation and modification, idealization and extrapolation;

- method of a system purposeful construction of new theoretical concepts, synthesized from a set of elements of knowledge of a different nature;
- method of analogies, based on the dialectics fundamental laws generalization for processes of a different nature;
- thought experiment;
- the method of double entry of basic components into the system (Lednev, 1989).

The general methodological basis of the research were

- dialectics, which is 'the only method capable of seizing living reality as a whole' and 'the law of coincidence of contradictions' (Losev, 1990);
- the principle of global connections and unity of the world; the theory of total-unity (Solov'ev, 1988, 1990, Florensky, 2017);
- Sorokin (1992) idea of a significant component;
- the concept of the integrity of the spiritual organism (Kireevsky, 2003).

Works in the field of general and pedagogical culturology, educology (Benin, 2004; Benin, Frolov, 2014; Bibler 1990; Zagvyazinsky, 2016; Zborovsky, 2000) have heuristic value for the research. When writing the article, we also took into account the instrumental potential of the pedagogical methodology (Bordovskaya, 2001, Atutov, 1985; Novikov, 2002; Korolev, Gmurman, 1967).

2.2. Research stages

The study was conducted in three stages.

At the first stage, the search for methodological approaches to the study of the problem was carried out. As a result, the concept of research was built.

At the second stage, the historical and pedagogical material on the problem was studied. As a result, the approaches to its evaluation were worked out.

At the third stage, the data of the studied material were stratified, generalized. As a result, conclusions were drawn.

3. Results

In accordance with the stated problem, we have considered the paradoxes of love and the ways of their solution in the Makarenko juvenile (adolescent-youth) pedagogy. Here they are:

3.1. The first paradox. *Love is a biochemical process and is caused by the action of hormones such as dopamine and oxytocin* vs. *Love is a socio-cultural phenomenon.*

Using antinomic dialectics tools, based on the recognition of equal rights and the equivalence of polarities, A.S. Makarenko dismisses the disjunctive approach to the problem solution. According to the disjunctive approach, one of conflicting sides is recognized as true ("either … or …" view). He puts in this arsenal a conjunctively oriented additional approach. In accordance with this approach, contradictory judgments do not mutually exclude each other, but cause coexistence with each other ("both ... and …" view). Thus, a tolerant attitude to both sides is maintained.

To some extent, such approach correlates with the two factors (heredity and environment) theory (Zinchenko, Meshcheryakov, 2003). But in this theory of convergence of these factors, the heredity dominance role is assumed. While A.S. Makarenko, not ignoring the significance of the biological (hereditary) factor in love, he believes that the sexual act 'can not be isolated from all the achievements of human culture, from the conditions of a person's social life, from the humanitarian path of history, from the victories of aesthetics' (Makarenko, 1958, vol.5, p. 220).

Moreover, according to A.S. Makarenko, the ability to love can be enjoyed by people endowed with a sense of civic responsibility for the fate of the society in which they live. "If a man or a woman does not feel like a member of society, if they do not have a sense of responsibility for his life, for his beauty and reason, how can they fall in love? Where do they get respect for themselves, confidence in some value of themself that exceeds the value of a male or a female?" From this the conclusion follows that "sex education is primarily the education of a culture of social personality".

Spiritual and social component of love, in the terminology of P.A. Sorokina (1992) is its significant component expressing the inner meaning of phenomena (processes, things). Without it, the national flag turns into a piece of matter, Beethoven's ninth symphony - into a certain number of waves of different length and amplitude, consciousness - into the aggregation of electrons and protons, and the love relationship is reduced to coition.

In general, Makarenko is building a kind of love triad: biological love, spiritual love, sociocultural love. Moreover, Teacher Makarenko goes beyond the two-factor binom. In addition to heredity and environment, there is upbringing. Of course, if you wish, you can embody upbringing in the environment. But the environment is inert, conservative, not immobile.

Education is a focused process of human development. This allows us to separate it into a line in the structure of human development factors. In this case, we get the formula:

$$D = (H + Env) \times Ed,$$

where D is development, H is heredity, Env is environment, Ed is education.

Clearly, love is, so to speak, a self-determination of the person. But for this very reason love simultaneously is a social phenomenon, carrying in itself the reduced specific features of HOMO SAPIENS and features of the representative of a certain society (group, nationality, class, etc.). Otherwise, we will deal with the "love" of a male or a female, as A.S. Makarenko said. And, to think, are people often right in their militant selfishness?

Located at the intersection of the universal (superindividual) and personal (individual) lines of being, a person simultaneously acts as a collective and individual subject. As a collective subject, a person seeks to merge with other people, not stopping at the loss of his- or herself, "the deadly sister of ignorance" (Roerich, 1992).

Is not Leo Tolstoy (1985) right, writing in his diary: “Egoism, i.e. life for oneself, for one person, is madness”. E. Fromm (1990, 1993) has a similar view that there is the same question in all cultures at all times: how to overcome separation, how to achieve unity, how to go beyond the limits of one's own individual life and gain unity", and the higher man's power manifestation is "giving" (Chapaev, 2005).

3.2. The second paradox. ***Love is a spiritual essence incomprehensible to the human mind*** **vs.** ***Love is "an ordinary affair that needs to be organized"*** (Makarenko, 1958, vol.5, p.298). When analyzing the position of Makarenko to solve this dilemma, one can get the impression that he secretly sensed some difficulties in a holistic awareness of the problem, allowed elements of a bifurcated perception of the phenomenon.

On the one hand, he elevates love to understanding it as a transcendental and metempirical phenomenon. As transcendental phenomenon, love, as Makarenko says, expresses the basis of human existence, the peak of human's spiritual development. As a metempirical phenomenon, love, in his opinion, is on a par with such "transcendentals" as goodness, perfection, the kingdom of heaven (ibid., p.519). The transcendental and metempirical elevation of love reaches such heights that it becomes inaccessible to a verbal description. In the "Book for Parents" there is a scene in which the heroine of the narrative says: "I do not know how to say this: I love you. I can not say it... It's so strong. She looked at me, and it was the look of a woman who fell in love" (Makarenko, 1957, vol.4, p.219-220).

On the other hand, the almost mystical elevation of love Makarenko very organically combined with the understanding of love as a pedagogical fact included in the general system of educational relations, which contain, as it’s known, organizational moments. Being a rationalist and social technologist, he is sure that "our behavior must be the behavior of knowledgeable people who know how people, know the techniques of life ...". Spirituality and ethics without knowledge and without organization are impossible. To the fullest extent, this refers to love: "We must be able to love, know how to love" [6, p. 453].

The great teacher-realist Makarov (1958, vol.5, p.300), perfectly understanding the intricacies of human nature, could not agree with the point of view that "at school a person under 18 can not love, because he is at school ..." (let us remember the popular quotation “this can not be, because it can not be”). No, says Makarenko (1958, T.5, p.299), "... it is not only possible but necessary, it is necessary to teach love. Strange as it may seem, but there is such a science ... "

A.S. Makarenko (vol.5, p.300) not just admit to necessity to "teach love," but also sets the parameters for this teaching: "Both girls and boys need to be told about the responsibility for each day lived, for every piece of feeling, because for all you have to pay ... ". Teaching to love "means teaching to recognize love, teaching to be happy, which in turn means teaching to respect oneself, teaching human dignity" (Makarenko, vol.4, p.220).

"Responsibility" is not an occasional word in the text. Responsibility in the higher understanding for Makarenko meant the teacher's responsibility for the fate of the person: the educator should always ask himself whether to dare or not dare to develop certain standard or individual qualities in his pupil.

In this specific case, the word of responsibility is used due to pupils of Makarenko. When organizing the "affair of love," he dealt with girls and boys, who knew a lot in their lives, including in the love field. Among them there were former rapists, and former prostitutes. In the report to the chairman of the state political administration of Ukraine, he writes about the difficulties of working with former prostitutes, who have now become communes of the commune named after them. F. Dzerzhinsky, stating that the activation of such girls "is very difficult due to their backwardness and already established habits and inclinations, early sexual development and the phenomena connected with them ..." (Makarenko, 1957, vol. 3, p. 459).

Add to this teenagers and young men who are familiar with the "experience" of sexual violence and even without a rich imagination, you can imagine what kind of bedlam the commune would have reformatted to, in the absence of an effective pedagogical system, where the problem of love was taken very seriously. Certainly, it would have turned out into a "good" “flash-house”.

It should be emphasized here that during the years of Makarenko's activity in the colonies for juvenile offenders, the joint education of girls and boys was strictly forbidden. It would seem that this is a radical solution to the problem of "flash-house". But Makarenko (1957, vol.2, p.100), on the contrary, believed that such an approach was fundamentally wrong: "As in any normal family, girls and boys live together, and this does not cause any complications. Any healthy children's society can perfectly develop under these conditions”. Again, we are faced with a paradoxical situation, now man-made, created by Makarenko himself. And in this act, he again confirms his dialectical-antinomic choice, which does not tolerate single-line solutions.

3.3. The third paradox. ***"Teaching love" is "analysis of narrowly physiological questions" of love*** **vs.** ***“Teaching love is the education of a great and deep feeling, adorned with the unity of life, aspirations and hopes*"**

A.S. Makarenko (1957, vol.4, p.413) in this case either does not leave the vale of "balancing thinking", focused on finding areas of common in opposite judgments (as well as in phenomena). Declaring that " teaching love" should be conducted "without too open and essentially cynical analysis of narrowly physiological questions," he is at the same time far from the pharisaical attitude to the problem. Responding to criticism of his assertion about the admissibility of consideration of even "about sexual love" with children, Makarenko (1958, vol.7, p.189) notes: "Comrade A. Boym blushes and shyly turns away: you can read "Romeo and Juliet", but sexual love ... what a passage! Is it possible that Comrade A. Boym ... does not know that "Romeo and Juliet" tells about sexual love, that platonic love does not appeal to these two heroes. After all, I did not call for the development of a topic about sexual intercourse, but namely, about love”.

Yes, love is sacred and inviolable; it is the intimate value of the human soul. A.S. Makarenko quite agree with such a premise. But this is true when love is viewed in a light of personal relationships. Therefore, in the colony, where, despite the adopted law prohibiting internal love relationships, the words "they are in love" were magical and before them the most ardent "guardians" of this law were powerless, which were, as A.S. Makarenko recognized them, ‘lads’. The law is a law, but he often had to report on the board, to the displeasure of many lads (sometimes he was even deprived of the right to speak): "They’re really in love, there's nothing you can do" (Makarenko, 1957, vol.2, p.101, p.103).

In a light of social relations, love becomes part of the social environment, which also affects love. But the problem is, how it affects. The Makarenko’s commune "... in resolving the sexual problem did not take the path of direct suppression and remained within the boundaries of communal forms of collective influence" (Makarenko, 1957, vol.3, p. 459). It's evident from the fact of family formations within the commune (see below).

The system of joint education affected the most positively the education of the right relationship between the young men and the girls. It contributed to the formation of positive experience of social behavior in general and the development of social skills in relationships with people of the opposite sex, which to a large extent served the purposes of raising a family man. Ultimately, a holistic strategy for the evolvement of a person, who respect positive socially significant values, was implemented.

4. Discussions

Dialectical and antinomian ideas permeate the entire body of the pedagogical system of A.S. Makarenko. The well-known expression "pedagogy is the most dialectical science" is not just a beautifully formulated idea, but an original symbol of the faith of the teacher Makarenko. In his attitude to dialectics, he is similar to the outstanding Russian philosopher A.F. Losev (1990), who considered dialectics to be the only method capable of "grasping living reality as a whole". Let us discuss three statements that testify the dialectical and antinomical core of A.S. Makarenko pedagogical system.

1. **The person and the collective are in a constant development mode.** A brilliant expression is found in Makarenko's concept of promising lines for the development of the collective. A.S. Makarenko formulated the law of the movement of the collective, according to which the collective must constantly move forward, to achieve more and more successes through overcoming difficulties and contradictions that fill the living space of pupils.

In a sense, A.S. Makarenko, as it seems, agrees with the aphorism of the German Social Democrat E. Bernstein "Movement is everything, the final goal is nothing." However, the antonymic thinking of the great teacher could not be satisfied with such unambiguity. The Makarenko law of "collective movement" is simultaneously the law of personality movement. Yes, the structural, technological and relational (communicative) features of the collective are being improved. But the " collective movement", development process, does not become the absolute criterion of Makarenko pedagogy.

This "movement" has a very specific goal - particular person's joy of tomorrow. The joy is "the true stimulus of human life ... Therefore, to educate a person means to cultivate long-range ways (to build a trajectory of personal development?). The joy of tomorrow will follow these ways (Makarenko, 1958, vol.5).

Developing the "joy if tomorrow" idea, A.S. Makarenko (Ibid., p.74) distinguishes a close, medium and distant perspective. Mastering these perspectives, the person comprehends the hierarchy of goals. First you need to organize the joy itself, bring it to life and put it as a reality. Then, it is necessary to persistently transform the simpler forms of joy into more complex and humanly meaningful. Here is an interesting line: "from the primitive satisfaction by some gingerbread to the deepest sense of duty."

2. The system organically does not accept the stereotype approach (while its opponents often act armed with a set of all discourse stereotypes), which tends to absolutize any technology, any technique. It is obvious for Makarenko: the choice of a pedagogical tool depends not on the deductive-dogmatic premise, which proves the special value of an approach, but on the specific education conditions, on the individual characteristics of the pupil. Therefore, the "collectivist" Makarenko (1958, vol.5) is able to comment on the collective impact that "sometimes it will be good, sometimes it will be bad." So it is with the individual effect: "sometimes it will be useful, and sometimes it will be harmful."

3. The system founds its solution to the problem of the collective and individual antinomy. The foundations of this antinomy are contradictory judgments, stated by A.S. Makarenko (1958, vol.5, p.469): "Some say: "The collective as a reality does not exist. Only the personality is real. " Others say: "The individual as something independent in social reality does not exist. There is only society." This collision is the genetically grounded basis of antagonism between individualistic and collectivist approaches in the history of education, which is such thoroughly cultivated, by the way, today.

Solving the personal-collectivist dualism problem, A.S. Makarenko, in fact, advocates the principle of indivisible and unshared unity of the individual and the collective. By individual education he means finding identity and development of personal abilities and orientations, not only in the field of knowledge, but also in the field of personality. He is tormented by the question: "Is a soft, malleable, passive temper prone to contemplation, reflecting the world in form of internally non-bright and non-aggressive analysis, should be broken, rebuild or improved?" "Am I really supposed to drive every individual into a single program, standard and to achieve this standard? Then I must sacrifice individual charm, originality, a special beauty of personality, and if I do not sacrifice, then what kind of program I would have! "(Makarenko, 1958, vol.5, p. 118).

Are there many teachers who thought so deeply about the question: what, in fact, what right do I have to interfere with the life of another person? Most often, the teacher, by default, considers himself worthy, and having the right to do it. Even advocates of personal-oriented education do not make an exception here, because "... education can be called, where the student is not the subject of educational interaction, but the object of more or less sophisticated pedagogical influence" (Gusinsky, Turchaninova, 2000).

Makarenko did not immediately got the answers to the above questions. For years he groped for answers. It took him almost ten years of titanic practical and intellectual work until he could confidently say: we need a common standard program and an individual correction to it. Such qualities as courage, honesty, diligence, collectivism, citizenship should become standards. A corrective is necessary with an orientation to inclinations, abilities, talent. A.S. Makarenko (Ibid., P.119) believed that the teacher has the right to interfere in the movement of character, in order to follow the inclinations of personality, to direct it to the side most needed for it. But with such a Solomon solution, the need for an appropriate dialectical method arises, "which, while being general and unified, at the same time enables each individual person to develop his own features, preserve his individuality" (Makarenko, 1958 p. 353).

The principle of the inseparable and un-confluence unity of the individual and the collective is antinomical in nature. It gave made A.S. Makarenko possibility to create an educational system on the principle of parallel action: in the pedagogical process, changes occur primarily due to the growth of the importance of self-management components in it, while minimizing didactic, instructive moments.

Speaking in modern terms, the teacher plays a role of a top manager, who decides the most important, strategic tasks, while less significant of them are delegated to individual members or organizational structures of the collective. In this context a well-known principle of the Eisenhower matrix occurs to us. It suggests professional, in terms of managerial science and practice, distribution of tasks depending on the degree of their significance.

At a certain stage of the development of the collective a qualitative leap in its development takes place. On the one hand, the self-management component in the organizational organism of the collective sharply increases: at its mature stage of development of the collective, each of its members makes demands to itself. Self-management becomes the need of members of the collective and a necessary condition for its existence. On the other hand, it is thanks to the increased importance of the personal component in the management of the team that a self-developing educational system is created that can exist under changed conditions. Even when, for one reason or another, the "top manager" is excommunicated from her, and moreover, when the new "bosses" are working against her. So, after the departure of Makarenko from the educational institutions that he organized, despite the disorganizing actions of the leaders who replaced him, it took a lot of effort and time to destroy this well-organized system in them.

At a certain stage of the collective development, a growth spurt takes place. On the one hand, the self-management component in the organizational body of the collective sharply increases: at its mature stage of the collective development, each of its members makes demands to him- or herself. Self-management becomes the need of members of the collective and the necessary condition for its existence. On the other hand, as a result of the increased importance of the personal component in the team management, a self-developing educational system is created that can exist under changed conditions. Even when, for one reason or another, the "top manager" is excommunicated, and moreover, when the new "bosses" are working against it. So, after Makarenko left the educational institutions that he organized, despite the disorganizing actions of the leaders who replaced him, it took a lot of effort and time to destroy this well-organized system.

Let us briefly discuss A.S. Makarenko (1958, vol.5, p.421) statement that "many attitudes towards love, friendship, loyalty, honor have not yet been balanced and become normative." Is it possible to develop regulations on love, honor? A.S. Makarenko admitted such a possibility. But what did he mean here? First of all, the need for public recognition of these categories. This is, in fact, about the thirties, it was very complex and contradictory, and somewhat antinomic period. By no means all considered love and honor, as well as concepts close to them, as worthy to be applied in a new society. Repeatedly, rejection of the past culture relapsed, which were especially typical for the 1920s ("Let us burn Raphael, trample on flowers of art ").

The issues such as "Is jealousy, and even love, a remnant of capitalism or not?" were discussed most seriously. A.S. Makarenko had to participate in such discussions. But it is remarkable that agreeing formally with some arguments of supporters of the idea of "remnants of the past" (which is, by the way, not over yet: one "big" Russian official was not so long ago going to fight "Soviet" bureaucracy), he actually softly but persistently corrected them. A.S. Makarenko (1958, vol. 5, p. 450) in the spirit of his time writes that "the phenomena of a relaxed ethic of "goodness" contradict our revolutionary movement, and we must fight this relic." However, after that he immediately takes the arrows to the other side: towards solving the real problems of the present life, and not yesterday. The proximity to practical life, to simple common sense, solution of pressing practical problems are crucial, in Makarenko's opinion, for the successful society development, but not an endless criticism of the so-called "remnants" of the past.

They considered the notion of honor as a remnant of the past. Surely, Russian 'white officers' used to say "This is an honor!" when there were no 'red officers' yet. And in 1937-38 A.S. Makarenko is working on the story "Honor". For which he got hard time from critics. But the teacher bravely defended himself, and not only defended himself, but also counterattacked. In his article with the self-explanatory title "Against stereotypes" (1938) A.S. Makarenko insists that "our criticism has long ago discouraged writers from bravery and active penetration into life . ..., people, who are equip with nothing but stereotypes, play roles of critics ... "(Makarenko, 1958, vol.6, p. 416). The stereotypes prevent writers from showing a multicolored picture of the life of Soviet society. "There are 170 million individualities in our Union, completely different, unique, each is exceptional in its own way" (Ibid., P.418).

In that article A.S. Makarenko (1958, vol.6, p.419-420) sharply opposes the theory of conflictlessness, proceeding from the metaphysical understanding of the unity of the Soviet people. He states that "on the contrary, a characteristic feature of our life is its conflict nature." Life in the Soviet Union, according to the teacher, "is built on the ***dialectical principle of movement and improvement***." Accordingly, he concludes quite in dialectical style: "The secret and charm of our life is not in the absence of conflicts, but in our readiness and ability to solve them." In accordance with the criterion adopted by the critics, A.S. Makarenko pointed out bitterly: "... the notion of honor is an officer-gentry concept" (Ibid., P.430). With this he could not reconcile as he could not reconcile with rejection of love. And just as he confirms his position with deed. In the first case, he writes the book "Honor" (in 1937!). In the second case, as we saw above, he in practice, in the conditions of a special educational institution, proves the necessity and possibility of organizing "affair" of love.

5. Conclusion

1. There are teachers-romantics, teachers-conceptualists. A.S. Makarenko is a teacher-realist, like Janusz Korczak, who is close to him in spirit and deeds (Korczak, 1990). Janusz Korczak was extremely respectful for Makarenko's word and deed. As a teacher-realist, Makarenko aspired that the educational community, entrusted to him, would, to the utmost degree, integrate real-life situations, the infrastructure of natural forms of human existence.

Educational collective is a family, as a result, it should be endowed with all its attributes, including such a characteristic as different gender composition. Such a "life" philosophy is consistent with the dialectical and antinomic methodology. First of all, because life itself is antinomic: it is intertwined with a variety of phenomena and processes, which are often as much opposite to each other as to how much they are interdependent. A.S. Makarenko did not put border posts between his educational and life processes.

Education and life are inseparable from each other for all their differences. The commune enters life, life enters the commune. So, the commune took it for granted to help the inmates adjust their family life, provide them with work, apartments and initial assistance. This type of assistance had not only a material side, but also an educational one. "The appearance of these family formations on the commune's territory has cooled many people, since it proved that love is associated with real responsibility" (Makarenko, 1957, vol.3, p.460).

2. A.S. Makarenko is an innovator, a creator, and therefore very often he walked off the map and contrary to the instructions coming down from above. You can imagine how he risked, taking responsibility for co-education. But Makarenko would not have been Makarenko, if he hadn't kept his eye on the ball. It is always difficult for such people. And it turned out that he was fired from his job, almost for anti-socialist methods of education. And after decades he got a lot for socialist education. Unfortunately, his compatriots stood on top of this case. The "fault" of Makarenko and the misfortune of his opponents lies mostly on his paradoxical multidimensionality (Morgun, 1989) of the perception and creation of the human world.

His critics view the world, including Makarenko's world, from the only one point, often from that one which gives them advantages at the moment. Others view Makarenko's world dualistically, lumping everything under a general umbrella, hoping there is some "harmful" element in it. Then they start searching, or rather, quote phrases, and even individual words, at random. It results in 'cabbage soup', in the first case, or confusion (or kind of 'a cock and bull tale'), in the second case.

It is worthy to note that in search of overly ideological statements of Makarenko, his opponents do not notice that the degree of their own ideology is much higher than the ideology degree of the person they criticize. For all their activities are focused on the solution of a purely ideological task, which is mainly, to debunk the socialist component of A.S. Makarenko educational system. In other words, this is not about education, but about fighting, as they used to say, for ideological purity. That is why people from the other disciplinary spheres often study Makarenko. It is hard to imagine a person as a teacher who, as far as one can understand from a very uneasy text, reproaches Makarenko that *there is nothing in his writings that would evoke such unconcealed hatred, contempt , indignations - neither bandits in the corrective labor colony with whom he had to work for many years, and who repeatedly destroyed what he created, not even their customs, to which he treated with understanding* (Dobrenko, 1987). The piquancy of the situation is that the quoted author even whitens, idealizes Makarenko. This can be seen from the fact that Anton Semyonovich did not treat all actions of pupils with "understanding", he was often outraged by their behavior and even there was a case when he strong-armed. The teacher admitted to that (Makarenko, 1957, vol.1).

A.S. Makarenko, within the framework of his pedagogy of life, has solved the real tasks of education, determined by the needs of society, and, as specialists find out, not only of the socialist society. By the decision of UNESCO in 1988 A.S. Makarenko along with John Dewey, Georg Kershensteiner, Maria Montessori was ranked among the teachers who determined the way of pedagogical thinking in the twentieth century.

As for Makarenko's ideology, it should be noticed, it was natural. The fact is that education does not form a person in general, but a person *in* a certain society and *for* a certain society. Accordingly, the goals of education can not be adequately understood in society as long as they are separated from the certain situations in which each age group is, and from the social system, in which they are formed (Mannheim, 1994).

3. Education, as the ancients used to say (they assume, generals who did not lose a single battle, used to say it), is the most difficult thing. But there was definitely no teacher who would achieve a 100% result. Not always A.S. Makarenko succeed, he did not hesitate to admit it.

Different things happened. There was even a dead child. A colony mother Raisa killed him and hid him in a basket for dirty laundry. She was sentenced to eight years probation, and they offered to take the criminal girl back to the colony. A. S. Makarenko agreed with this. But he did not envisage the reaction of other colony girls. Soon he heard from them: "Eject Raisa from the colony, otherwise we will get her off ourselves." What did A.S. Makarenko do? Secretly from other girls he got Raisa a job. Once, having met him by chance in a few years, she said that she was "all right". She said finally: "Thank you, you did not let me sink then. As I went to the factory, I forgot bygones" (Makarenko, vol.1.1957, pp. 119-120). A.S. Makarenko did not let people "sink", but he saved people, rising them up from the very lowlife. But he was took down. "Sinked" then. There are those who wish to "sink" him today. But he again and again "rises up" and continues his eternal voyage through the waves of the obstinate and endless ocean, the name of which is pedagogy, in which Makarenko's pedagogy of love occupies a worthy place.

6. Recommendations

The paper may be recommended to scientific and practical education workers, undergraduates, post-graduate students; to people involved in educational policy; to representatives of business circles; to all who are interested in the present and future of our education and upbringing.

Notes on contributors

Nikolay K. Chapaev is Doctor of pedagogical sciences, professor of Russian State Vocational Pedagogical University, Ekaterinburg, Russia.

Olga B. Akimova is PhD, Doctor of philological sciences, professor of Russian State Vocational Pedagogical University, Ekaterinburg, Russia.

Evgenij M. Dorozhkin is Doctor of pedagogical sciences, professor, rector of Russian State Vocational Pedagogical University, Ekaterinburg, Russia.

Abstract
The work is concerned with development and application of behavioral models as parts of automated measurement systems to test integrated circuits (IC) of high-frequency voltage switching converters with the aim to automate measurement process, search and use methods for controlling junction-case thermal resistance in the most rational way. A description is provided of an alternate implementation of test equipment and an algorithm for determining thermal resistance, which applies a reference behavioral model in the process of automated testing of integrated circuits. Modelling of integrated circuit LM2596 is made, taking into account heat emission and mutual effect of crystal temperature on external electrical characteristics inherent in the general behavioral model. The results were obtained, coincident with experimental data and transistor level SPICE-model, and dependencies reflecting the effect of crystal temperature on microcircuit operation were found. A method for automated control of controlling junction-case thermal resistance is suggested. It is customized in terms of speed of performing measurements and is suitable for use in microelectronic industry. Its limitations and application area have been defined. Potential use of behavioral models as a source of reference data during testing electronic components is presented.
Keywords: automated test equipment, controlling parameters ofmicrocircuits, voltage switching converters, behavioral model, VHDL-AMS, thermal resistance.

Introduction

A need for considering and creating behavioral models of electronic components, and, from a wider point of view, of any technical objects, has currently become more and more pressing. This is due to the fact that, when applying traditional approaches to the use of models in electronic development application (EDA) system, there are certain difficulties and often inconsistencies between functional requirements imposed on them and the volume of available computational resources. The main problem lies in constantly seeking a compromise between computational complexity of the model and its adequacy to real physical processes. Thus, a developer faces the choice: either to create a “full-fledged” model of each component that reflects all variety of physical interactions (electromagnetic, thermal, mechanical, etc.), or deal with many particular models depicting only one aspect of their application in EDA. For example, there might be electrical characteristics of circuits in SPICE-models [1] for analyzing circuit operation, or electrical characteristics of buffer (interface) parts of components’ models in IBIS-models [26] to be used for controlling integrity of signals (Signal Integrity). Implementing this approach results in the need for developing in a number of cases more than ten particular models for one electronic component. All these models are independent, and in most cases they cannot be combined for the purpose of, for example, examining the effect of environment temperature on the modes of integrated circuit operation. It would be possible for a general complex model that simultaneously includes several physical areas.

There is a known approach to modelling, based on the combined use of fundamental systems of mathematical physics equations, geometry of an object of interest, and finite-element method, implemented in software applications Comsol Multiphysics [27], ANSYS [28], etc. This approach allows to obtain rather adequate multi-physical models of certain components. High requirements for developer's competence in mathematical physics methods, which is rare in everyday engineering practice, have been a challenge here on the one part, and computational complexity of such models, on the other part. The last is inherent in all approaches associated with numerical solution of differential equations' systems. It is difficult to compute adequate models obtained thereby, hence, the problem often lies in creating models that already contain several dozens-hundreds of components, while the requirements of EDA users for the number of components in the projects are constantly rising, and customers of electronics design solutions want to see complex models of devices, which involve thousands and several orders more elements in one circuit.

Applying theoretical approach to synthesizing models of the real technical objects indispensably implies mandatory abstraction and idealization of their properties. Evidently, these processes may considerably change description of the modelled system, and it would lead to distortion of the modelling result, and the obtained result would not serve as an answer to the problem to solve. In due time, these aspects were demonstrated by A.A. Samarskiy [2] and Y.Z. Tzypkin [4]. Abstraction and idealization are usually not applied when implementing experimental-statistical approaches. More adequate models might be obtained based on experimental data, should these approaches be better developed.

Time for designing is crucial in microelectronic and other technical industries. Design, fabrication, and testing have become increasingly complex and expensive. To reduce time and labour costs spent for development, behavioral IC models are utilized. Such models describe features of integrated circuit as a whole, and specify appropriate input and output signals of the system, through simulating its operation.

Behavioral model (BM) reproduces the required behavior of the original system in question. Here, it is supposed that there is an unambiguous correspondence between behavior of the original physical system and the implemented model [25]. It implies, in its turn, that such a model exactly predicts the future states of the system based on the current and past states' data.

Implementing the behavior-based approach in research work is related to the need for obtaining data to make further system-oriented analysis, which enables to take into account physics that underlies the external behavior and to receive therefrom proper cause-and-effect, mathematical, logical, and other associations.

Another way to apply behavioral approach is to simulate the systems made of multiple elements, for example, complex electronic, microelectronic, and electrical circuits. It has been made possible, since the amount of computational resources required to implement a specific behavioral model of the circuit component is several orders less than that needed for the similar model described using differential equations, or SPICE-model.

"Behavioral model of the system specifies, at what cost the required functionality is attained, and what data are used to provide it. Thus, a behavioral model is directly based upon functional and information models of the system" [29].

High-frequency voltage switching converters (VSCs) have been widely used in secondary power sources, inherent in virtually all products of electrotechnical and radiotechnical industry, namely, in computers, TVs, various automated devices, and systems. As much as several dozens of such microcircuits are in electrical equipment of present-day technical facilities. Failure of one IC may have deadly consequences, that creates a need for organizing a continuous inspection testing of such products. Besides, a problem of computer-aided inspection of parameters of the integrated microcircuits shall be solved during various stages of their fabrication (on wafer, after packaging, etc.) This work deals with solving the problem of identifying a reasonable approach to making and applying behavioral models within IC's testing equipment through the example of microcircuits of high-frequency controllers of voltage switching converters, and in controlling thermal resistance of integrated microcircuits.

Junction-case thermal resistance of semi-conductor device is the major parameter that specifies its quality of manufacture. This parameter defines the value of overheating (over temperature) of active area of crystal as related to package temperature. Low-quality crystal-to-package bonding may result in exceeding allowable temperature of the device, accelerating degradation processes and inducing defects in the device structures, and, as a consequence, in failure of semiconductor device under operating conditions. It is known that failure of microcircuits that contain power components is due to the following main reasons: 20% –

effect of external climatic factors, 20% – mechanical effects, 60% – disturbance of thermal regimes. Overheating of crystal in semiconductor device directly depends upon its thermal resistance. Temperature of crystal is used to calculate reliability and estimate lifetime of semiconductor devices. Reliability of devices deteriorates exponentially as temperature increases. As a rule, 10 – 15 ° C increase in temperature may reduce product lifetime by more than 50%. Therefore, it is necessary to measure the precise temperature of crystal, when semiconductor device is functioning under rated operating conditions.

Junction-case thermal resistance is a parameter of not only reliability, but of the degree of quality inherent within technological process for fabricating semiconductor devices. Hence, determination of thermal resistances of semiconductor devices constitutes one of the basic problems of final inspection when fabricating semiconductor devices and incoming inspection when fabricating radio-electronic equipment.

There are transistor keys within the structure of high-frequency voltage switching converters' (VSCs) microcircuits that commutate currents of up to 10A and more. It can cause microcircuit overheating. There are standards regulating control over junction-case thermal resistance of power transistors, and there are proper methods basically suitable for controlling junction-case thermal resistance of VSC microcircuits, however, since the number of microcircuits' terminals is limited, usually there is no access to basic terminals of transistors.

Analysis of VSC microcircuits' structure shows that there is a *p-n*-junction (diode) between some terminals, which properties may be used to control temperature of the junction and of the whole crystal when defining junction-case thermal resistance of these microcircuits.

Reviews of literature

Behavioral models of integrated circuits are created to solve various problems: functional analysis of the supposed device architecture [5, 21], verification and debugging of the designed software (drivers) [21]. Prior to developing behavioral model, it is necessary to elaborate it in detail. The more detailed the model is, the more time is required to develop and implement it. However, the less detailed the model is, the less applicable it becomes in the process of designing an electronic device: a very simple model may be utilized only to solve some certain local problems.

Use of behavioral models to describe ICs is analyzed in works [3, 21]. Thus, work [3] suggests a compromise, when a functional model is developed without regard for time delays with additional unit-arbiter. The last distributes these delays into input and output signals, simulating real operation of the device. This solution allows to use the developed model both for functional analysis, and for verification purposes via turning on or turning off a unit-arbiter.

In work [21], BMs of integrated circuits, used for various purposes, contain coupled models of such functional units, included into BM, as, for example, comparator circuit, amplifier, oscillator, etc. This method enhances effectiveness of using models for solving local problems, however, it requires relatively more time to develop them.

Work [12] describes in detail behavioral models and their application in analogue, digital [9], analogue-digital [16, 24] devices. Modern PCs enabled to simulate these models, using complex algorithms that involve millions of calculations in a short time. A technology of modelling allowed to simulate impact of direct, and alternate current, and transient processes in the large integrated circuits (LIC). Noise research [17], frequency [10], and statistical analysis [23] are also possible. Structures of integrated circuits may be optimized at the expense of BM through the use of sensitivity analysis.

So called SPICE-models [6, 15] of devices are used to study parameters of a device (for example, direct current transfer ratio (β), saturation voltage (Usat) and saturation current (Isat) for bipolar transistor). Models of devices, implemented in SPICE, are usually complex. For instance, standard model of field-effect transistor has three detail levels. The simplest Shichman-Hodges model is based on quadratic equations. It makes sense to use it, when there are no strict requirements for modelling accuracy. The second level model is based on the more accurate analytical expressions. The third level model is semi-empirical and uses combination of empirical and analytical expressions. To determine parameters of these expressions, the results of measuring characteristics of real semiconductor devices are used.

The second and third level models take into account the second level effects, such as channel length modulation. It may be expedient to use the third level model when analyzing circuits with vertically structured power MOSFETs. It, in its turn, usually requires much more time for modelling and greater memory when modelling of complex systems.

Equations for devices are usually embedded into simulator and are available for a user. Ebers-Moll equation, usually used in SPICE simulation programs, is an example of using such equation as a simulation of direct current bipolar transistor operation.

As with digital projects, the size of modern analogue or mixed circuits in terms of the number of elements applied therein, nowadays is too large to continue their modelling in SPICE-oriented systems. The main problem here lies in limited computational resources available, required to simulate circuits that have multiple components. Several thousands of even logical equations cannot be effectively simulated neither using automated, nor analytical means. In practice of digital design, a proved fact is that circuit design solutions for functional units with more than a thousand of logical elements become inacceptable. However, modern integrated circuits contain millions of logical elements, with ever increasing complexity. There is a similar tendency in analogue circuitry engineering: models of analogue elements as opposed to logical ones, described by algebraic equations and delays, require for description an application of differential equations, numerical solution of which needs orders of magnitude more computational resources.

To solve the problem of interest, macro-modelling was proposed and introduced in EDA as a higher level tool for abstraction. It was also implemented in SPICE simulators. Macro-models were invented in 1974. Pre-determined components (controlled sources, resistors, condensers, etc.) are used to specify macro-model behavior. Functionality in macro-models is defined by a mathematical relationship, maintained through sources of controlled voltage and current. This method may be helpful in adding and subtracting voltage/current using sources of parallel current and series voltage sources. Division and multiplying are made through the use of resistors. Differentiation and integrating are performed using condensers and inductors. Such macro-models are easily applied, when describing simple behavior, that involves only basic relationships in the model [12]. However, when accuracy is too high and there are many details, and behavior becomes complex, it could be challenging and, sometimes, impossible to develop an operable macro-model.

Analogue behavioral modelling uses a hardware-description language for describing behavior of a device. Such type of modelling enables a user to describe behavior of the device as a function of physical variables (voltage, current, time of modelling, etc.). Such types of models as HDL and SPICE are sometimes intermingled since SPICE equations constitute behavior models as well. However, equations of components in SPICE are directly embedded into simulator, whereas behavioral simulator will contain equations for devices in HDL. HDL simulators may be as precise as SPICE simulators. However, SPICE simulators are used for modelling at the level of simple electrical device components, which sometimes provides them with higher accuracy in modelling certain devices.

Various methods for modelling analogue behavior may be added in SPICE simulators, which enable to use polynomial-controlled sources, modify simulator code to add new models, or create macro-models. Polynomial method is used when creating behavioral models of devices. Relationships between their parameters may be described by various curves. The problem here is that the curve needs to be reconstructed, whenever any of the device components changes in the process of creating thereof. Adding new model in SPICE simulator is labor-intensive, since the main simulator code for models of devices is often very complex. Macro-models may become complex, when mathematical behavior is synthesized by electrical components with non-linear relationships between parameters (for example, using diode). Since models on HDL languages are separate from simulator, in general, any algorithmically describable behavior might be modelled. In analogue behavior modelling, not only modelling of the device electrical parameters' behavior is possible, but modelling of temperature and capacity as well. A disadvantage of this behavior model is that currents and voltages (direct and alternate) may be determined only at the model input and output. However, while creating a model, it is possible to immediately derive an electrical value of interest inside the circuit to output, for further debugging and understanding, if the newly created model is

appropriate. Thus, to optimize the design of electronic device, it is necessary to keep in mind all possible ways of applying behavioral model when developing thereof.
The most well-known and popular general methods of developing behavioral models are nowadays as follows:

- Control-flow charts;
- Event-driven process chain diagrams;
- Use of UML;
- Use of functional diagrams.

Construction of control-flow charts has been regulated by a number of national standards, for example [30]. This method is very well-known, being one of the most common in the practice of creating texts on various programming languages, including those used to develop BMs. The important advantage of this method is that it is illustrative and simple in translating description from the flow-charts' language into the program text on the language of implementing behavioral model (VHDL, Verilog, SystemC, etc.)
Event-driven process chain (EPC) is a type of diagrams and descriptions, widely used for modelling, analyzing, and re-organizing business-processes. It can also be used to model behavior of parts of the system, when implementing its functions, and may serve as an adequate replacement for traditional flow-charts.
"A diagram of the process (function) in EPC notation is an ordered combination of events and functions. Initial and final events, participants, performers, accompanying material and information flows may be defined for each function, and its decomposition into lower levels may be done" [29].
The process of modelling using EPC complies with classical principles of modelling: decomposition and hierarchical ordering. Decomposition, displayed on certain diagrams, shall be made for functions, likewise predetermined processes on flow-charts.
Unified modelling language (UML) (Object Management Group) has currently been a common standard in developing object-oriented systems. Development of UML began in 1994 by Grady Booch and James Rumbaugh working in Rational Software company. Ivar Hjalmar Jacobson joined them in autumn 1995, and in October of that year a Unified Method preview version 0.8 was released. Since then, several versions of UML specification were released [31].

Control-flow charts and UML are best suitable for modelling traditional systems based on structural approach principles and characterized by clear separation of functions into basic steps (procedures, operators, actions, etc.) taken according to a certain sequence (as per algorithm). EPC- and BPMN-diagrams are quite suitable for modelling event-oriented systems, where taking an action or several actions depends on events occurring within a system. Furthermore, the above methods and methodologies may be used not only for behavioral modelling, but for functional modelling as well. The elements inherent therein, which allow to reflect conditions of taking particular actions (logical symbols), enable to better understand logics and sequence of executing system functions.
National standard [32] is the basic Russian regulatory document specifying the method of controlling junction-case thermal resistance of power diodes R_{thjc}. It presents two alternatives for determining thermal resistance of diodes, each of which also involves two stages. The first stage in both options implies determination of temperature-sensitive parameter – temperature relationship. The second stage involves determination of difference in crystal and package temperatures in a variety of ways. Junction-case thermal resistance is defined as a relationship between difference in crystal - package temperatures and heating power in steady-state rated operating conditions.

It is advisable to use direct voltage u_F for diodes or on-state voltage u_T for thyristors and symmetrical thyristors as a temperature-sensitive parameter. Crystal temperature T_J is defined by the device calibration curve. Semiconductor device is calibrated in thermostatic regulator, when gauge current flows with no effect on thermal equilibrium.
A concept of thermal resistance requires acceptance of such simplified assumptions, as one-dimensional heat flow, which may inaccurately simulate three-dimensional heat conductivity in a real device. Actual devices contain material and boundary layers with thermal resistances and heat capacities producing complex heat flow.

Labour-intensive methods of measuring thermal resistance recommended by standard [32] are applicable only to single diodes in laboratory conditions. They shall not be used for automated control in conditions of series manufacturing.

It is also important to emphasize standards [33] [34]. Pursuant to them, semiconductor device is heated by heating capacity impulse. *p-n*-junction temperature $T_J(t)$ is measured in the process of heating an object until reaching steady state. To measure $T_J(t)$, heating capacity regularly switches off for a while (for several ones or tens of microseconds) and a temperature-sensitive parameter is measured, namely, voltage drop within *p-n*-junction when direct current is small. Transition thermal characteristic (TTC) $T_J(t)$ serves to determine thermal resistance components that correspond to certain layers of the object composition or structure. Information about thermal parameters of an object shall be obtained within one time scanning period, usually not exceeding several hundreds of seconds, when not more than 2000 total number of temperature readings (200 readings per decade). TTC measurement accuracy is related to quantization error of analogue-to-digital converter and influence of transient thermal and electrical processes, while semiconductor device is switching over from heating mode to measurement mode. To more precisely identify thermal parameters by TTC, A. Poope and V. Szekely proposed so called device of structural functions [19, 20].

To reduce impact of electrical transient processes, linear modulation law shall be applied, when impulses of heating current with specified amplitude and constant repetition interval are passed through diode. Duration of these impulses is altered linearly. In-between heating impulses, direct voltage within *p-n*-junction is measured, when current is small. It allows to reduce influence of electrical transient processes, since here the velocity of changing junction temperature is measured, not its absolute value. However, due to slight gradient of change in average heating capacity, this method produces low accuracy of measuring thermal resistance and does not allow to determine components of thermal resistance.

In recent years, methods have been actively developed, which are based on analyzing frequency-based thermal characteristics, i.e. relationship between amplitude / phase of change in junction temperature $T_J(\omega)$ and frequency when a device is heated by capacity altering according to harmonic law $P(t)=P_0+P_m\sin\omega t$. These methods [1–5] allow to measure thermal resistance of single layers of semiconductor device structure: crystal, crystal-holder, solder layer, or conductive adhesive, and package base. Computations of amplitudes and phases of the main harmonics of heating capacity and temperature of *p-n*-junction allow to determine module of transient thermal resistance (thermal impedance) and shift of phases φ between temperature of *p-n*-junction and heating capacity. Then, relationship between thermal impedance module and heating capacity modulation frequency $Z_{thjc}(\omega)$ is identified, and thermal circuit parameters are defined. By analogy with electrical circuits, thermal impedance is considered as complex number $\underline{Z}_{thjc}= Z_{thjc}e^{j\varphi}$, real component of which defines thermal resistance $R_{thjc}=Re[\underline{Z}_{thjc}]$.

Proceeding by thermal diode parameters' analogy with parameters of electrical circuits, comparison may be made of TTC $T_J(t)$, determined as per standard [34], with time circuit characteristic $h(t)$, and thermal impedance $\underline{Z}_{thjc}$ may be compared with complex frequency characteristic $K(j\omega)$. Then, relationship between thermal impedance module and frequency of heating capacity modulation $Z_{thjc}(\omega)$ will be similar to $K(\omega)$, an amplitude-frequency characteristics of electrical circuit.

The discussed thermal characteristics of diode differ in the type of argument of the analyzed junction temperature relationship: time or frequency. They are of interest when examining dynamic modes of diodes' operation. However, thermal impedance R_{thjc} is more often used. It shall be defined in a steady-state thermal mode. It is given in reference data of diodes and integrated circuits of high-frequency VSCs.

Significantly different methods for determining thermal resistances of semiconductor devices are suggested in a number of works, for example, measurement of thermal parameters of digital integrated circuits with the use of temperature dependence of signal propagation time [1]. Potential use of the time of delay in signal propagation as a temperature sensitive parameter, when measuring TTC of digital integrated circuits, is presented. This time changes over a wide range and depends on temperature. The need for measuring short intervals of time with picosecond accuracy hinders application of this method. Aside from that, this method may not be used for automated control over thermal parameters of VSC integrated circuits. In light of the above, an original approach is implemented by the authors to application of behavioral models for controlling thermal impedance, along with electrical parameters.

Methodology

Generally, for having fully observable or mathematically properly described system, implementation of behavioral model is possible in any algorithmic or object-oriented language of programming, or, from a wider point of view, in any rather developed language at all, both described by formal grammars, and natural one as well. The last follows from our everyday practical experience. Therefore, in our work it is reasonable to narrow down an area of the system concept to an integrated microcircuit, taking into account practical objective of the work: to obtain compact behavioral model suitable for use in EDA and automated testing equipment. The authors developed an automated measurement complex for testing microcircuits of high-frequency voltage switching converters. Integrated microcircuits are represented by down and down/step-up voltage switching regulators with up to 5A output current.

The complex hardware is made using National Instruments [36] equipment. It includes:

– modules PXIe-4139 (sources/meters);
– module PXIe-4142 (four sources/meters);
– module PXIe-5114 (analogue-to-digital converter);
– module PXIe-2567 (64-channel module for controlling external relays);
– module PXIe-6230 (timer/generator and control over external devices using logical signals);
– module PXIe-1078 (PXI chassis);
– module PXIe-8821 (controller 2,6GHz intel Core i3 - 4110E dual core processor);
– test-adapters with contact devices for various types of integrated microcircuits' packages;
– chip prober connection unit to control parameters of devices directly on silicon wafer.

Complex (tester) facilitates measurement of a number of static and dynamic parameters in several sub-ranges, and control over external devices (probe, grade sorter, heat/cold chamber).

Since measured parameters are temperature-dependent, and tests are conducted in a wide range of temperatures, an approach is suggested that allows to minimize the volume of preparatory reference information (RI) containing maximum allowable values of measured parameters. It is possible due to refusal of using tables of values of standard technical data for each potential set of environmental conditions and type of tests. Such refusal is possible since behavioral model of the tested device is utilized as a source of RI. BM allows to describe in compact form any external impacts, conditions, and possible responses of the integrated circuit in question.

Behavioral models may be created using high-level language of describing VHDL hardware (Very-High-Speed Hardware Description Language). This work used VHDL-AMS language, described by standard IEEE 1076.1 [13]. This language enables to describe mixed behavioral models (AMS, or Analog and Mixed Signal), to implement description of multi-discipline models. Use of VHDL-AMS allows to describe physical interconnection of electrical and thermal parameters of integrated microcircuits of voltage switching converters [7, 8, 11, 14, 18].

To increase velocity of computations, it is suggested to minimize designed complete electrical diagram of IC by organizing analogue component only for electrical interfaces by specific IC outputs. It is suggested to specify external thermal influence through additional model interface with no physical analogue as a particular IMC output. Connected to the above interfaces functional model shall primarily be described algorithmically.

Integrated circuit LM2596 [37] produced by Texas Instruments, has been chosen as an example for analyzing. Internal structure of this integrated microcircuit, pursuant to the published reference data, is presented in Fig. 1.

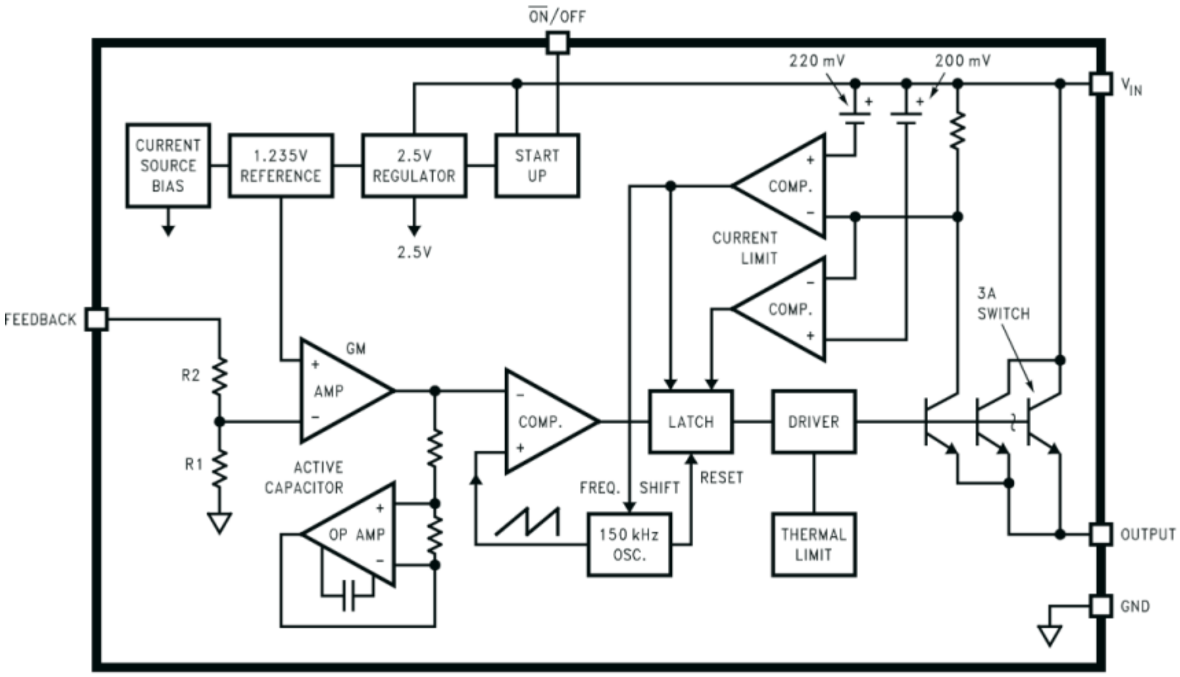

Fig.1. Functional structure of LM2596 integrated microcircuit

For this integrated circuit of Texas Instruments company, a macro-model was developed in PSPICE language, which has been used to verify behavioral model. Functional circuit of model comprises functional units:

- commutation output key based on idealized key with temperature-dependent parameters of its differential resistance and saturation on-state voltage;
- error amplifier module implemented based on unit with transfer function described using the Laplace transform;
- units of limiting input and output signal of error amplifier;
- unit of functional generator of saw-toothed and strobe signal;
- units of limiting integrated circuit operation by current and temperature.

Each unit is implemented on VHDL-AMS language, likewise the entire functional system presented in Fig. 2

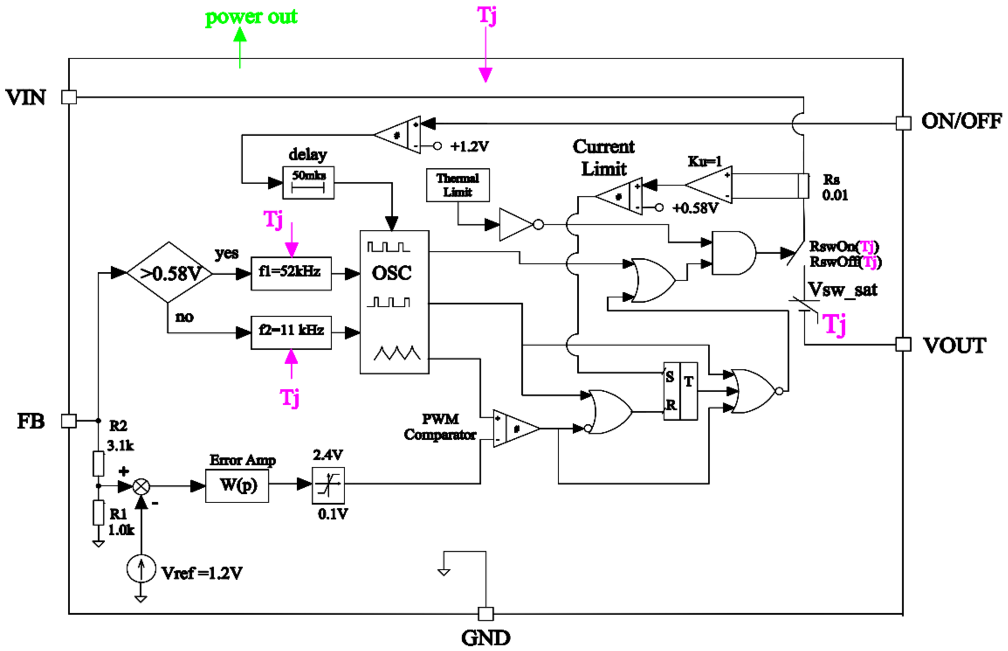

Fig.2. Functional structure of behavioral model

Results

To practically debug and generate behavioral model, SystemVision Cloud Mentor Graphics [38] simulation environment was used. It is accessible as a public Internet-service. The model structure is presented in Fig.3.

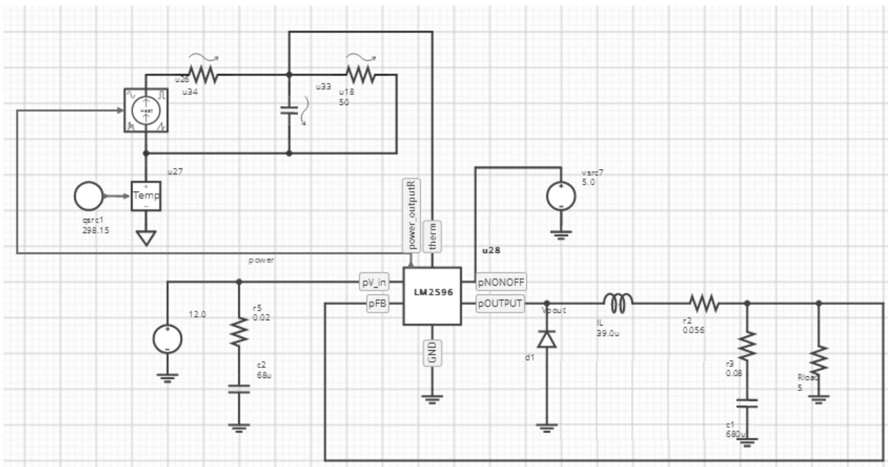

Fig.3. VSC model in SystemVision environment

To verify the obtained model, numerical experiments were made [22], through including the newly created BM into circuit presented in Fig. 3, as well as comparison of the obtained results with the data of technical description of the discussed integrated circuit.

Time-wise diagrams of output voltage, inductor current, when converter starts-up, are given in Fig. 4-7. The obtained results are in good agreement with the results obtained using SPICE-models and experimental data, obtained by means of the above-mentioned experimental unit.

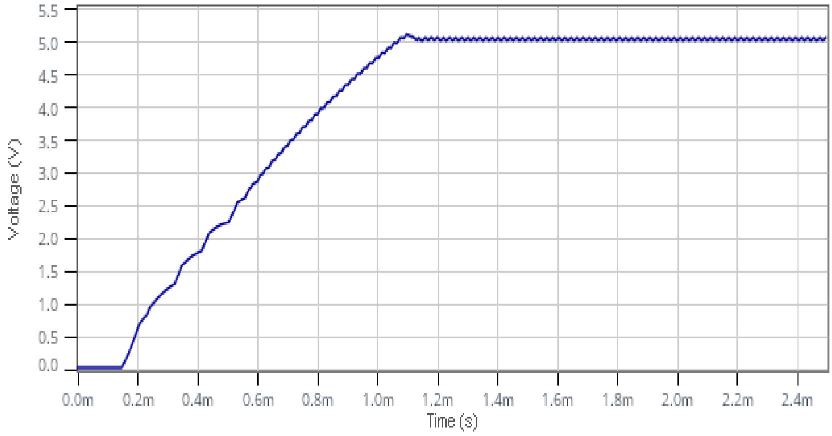

Fig. 4. Graph of VSC load voltage at startup

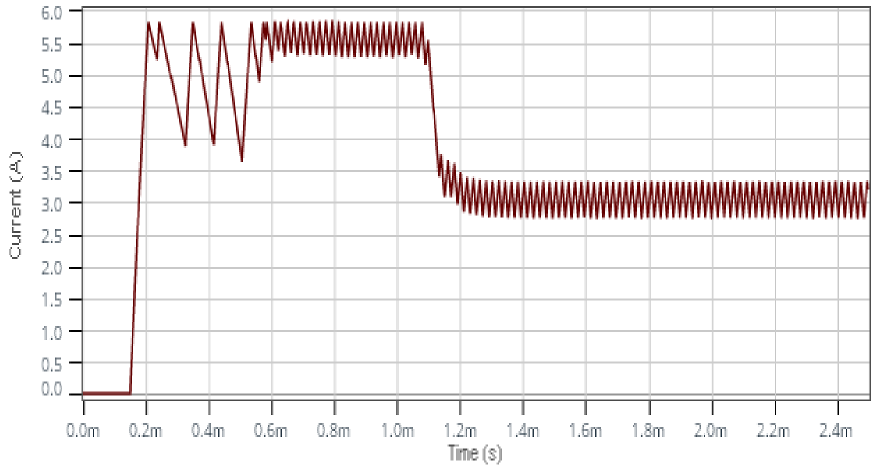

Fig. 5. Graph of VSC inductor current

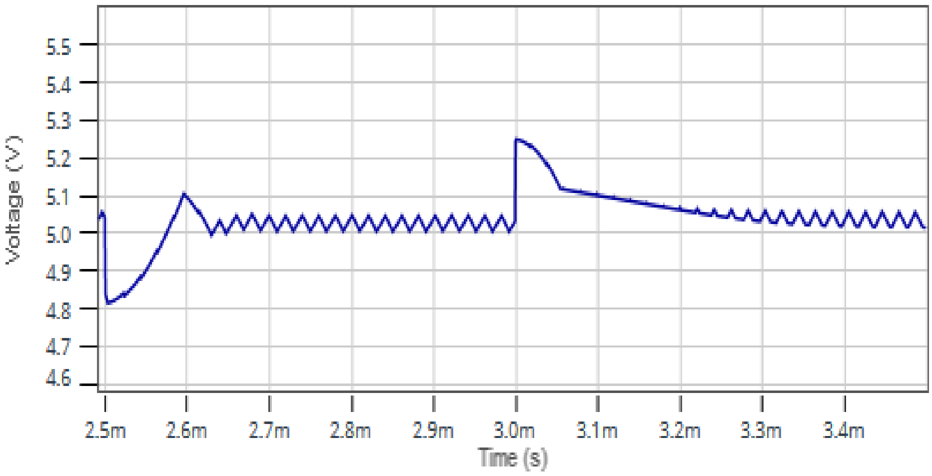

Fig. 6. Graph of VSC load voltage when load is transient

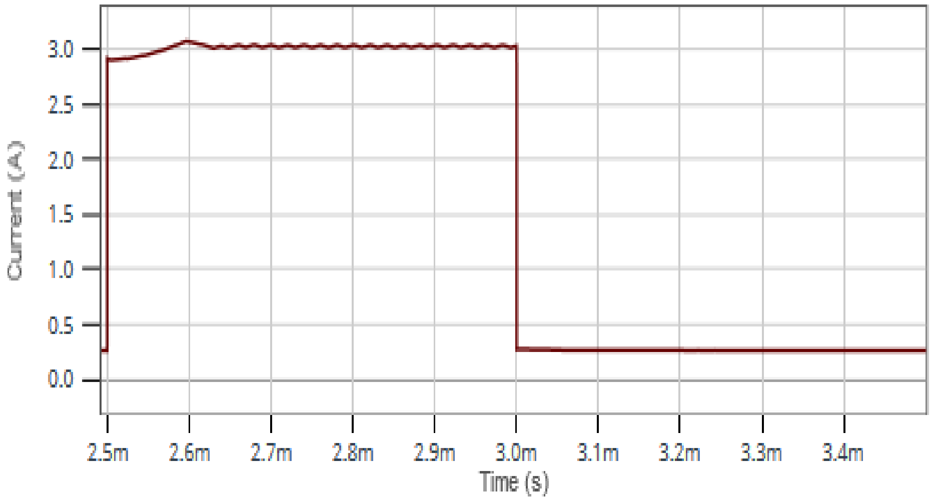

Fig. 7. Graph of VSC load current when load is transient

The result of temperature impact on parameters of converter may be assessed, controlling voltage at the Vout circuit output. A segment of this time diagram is given in Fig. 8. Considering that circuit input voltage, supplied to VIN output, is 12V, the difference between it and maximum values of VOUT voltages amounts to the value of residual voltage drop on the power key of integrated circuit. A change in this voltage and commutation period under the influence of temperature may be seen in Fig. 8.

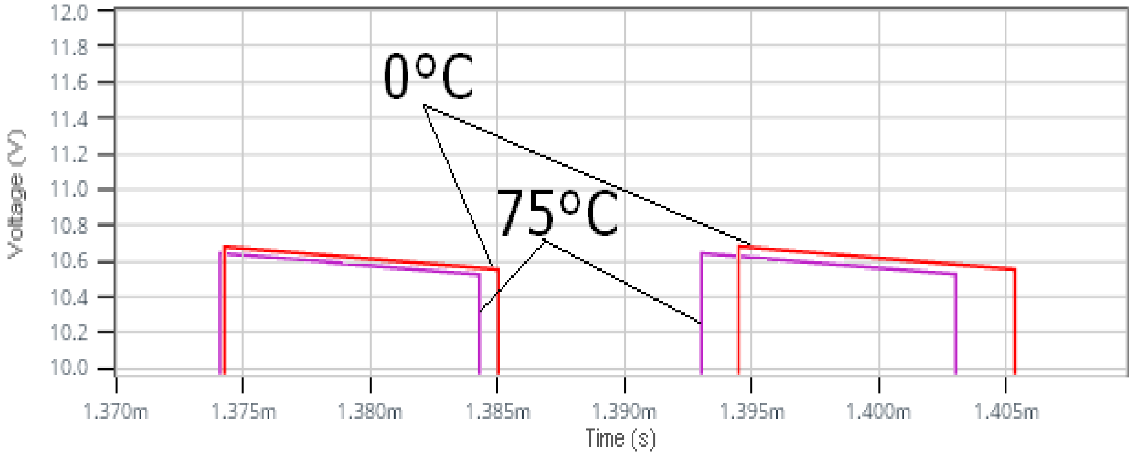

Fig. 8. Graph of VSC load current when load is transient

The work results may also involve the suggested accelerated method for controlling thermal crystal-package resistance. It is obvious that if the tested diode has thermal resistance higher than that of the reference diode, the temperature of its crystal at the moment of measurement will be higher than the reference one, and the voltage difference ΔU shall be lower than reference difference $\Delta U_{ref.}$ However, a change in voltage U is not proportional to change in thermal resistance. It is worthwhile to assess, how temperature and value of temperature-sensitive parameter change, when diode thermal resistance changes. Presuming that averaged temperature of diode crystal, when heated by rated current, changes pursuant to exponential law according to equation:

$$T_J = T_{kn} + T_{Jm}(1 - e^{t/\tau}),$$

where T_{kn} – initial temperature of package, $T_{Jm} = T_{kmax} + P{\cdot}R_{thjc}$ – maximum increment of crystal temperature, τ – thermal constant of package heating time, T_{kmax} – maximum increment of package temperature in a steady state mode, P – thermal capacity, then, if R_{thjc} increases, for example, twice, maximum increment of crystal temperature will change as follows:

$$T_{Jm} = T_{kmax} + 2P \cdot R_{thjc}.$$

Assuming that package temperature when heated slightly changes, change in crystal temperature is disproportional to change in thermal resistance and shall be described by equation:

$$T_J = T_{kn} + (T_{kmax} + P \cdot R_{thjc})(1 - e^{t/\tau}).$$

Fig.9 presents a graph of crystal temperature changing for three values of junction-case thermal resistance, when rated value $R_{thjc,н}$=2 °C/V. Graphs correspond to T_{kn}=20 °C, T_{kmax}=80 °C, τ=50 c, P=5 V. Here, a steady temperature of crystal will be higher than the package temperature by value $P \cdot R_{thjc}$.

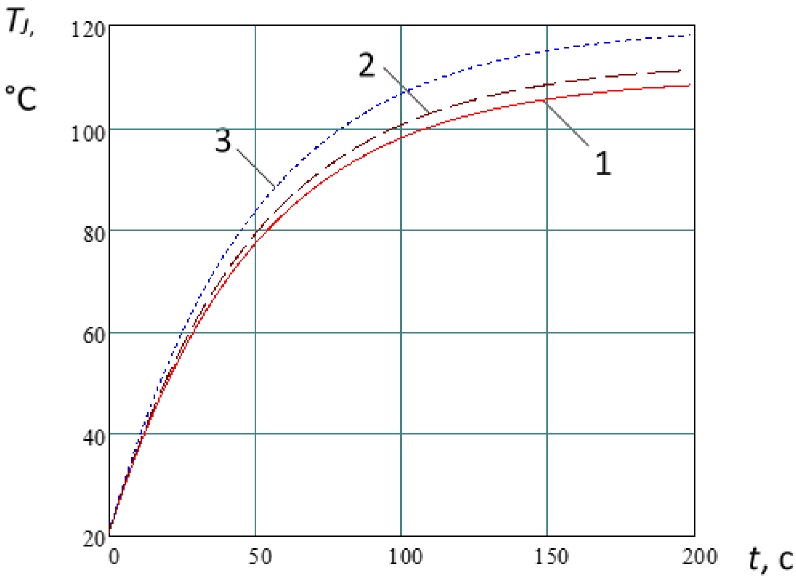

Fig.9. Temperature curve for various thermal resistances:
1: $R_{thjc} = R_{thjc,н}$; 2: $R_{thjc} = 1.3R_{thjc,н}$; 3: $R_{thjc} = 2R_{thjc,н}$

The graph shows that, by the moment of time τ = 50 sec, crystal temperature reaches 76.9°C when $R_{thjc} = R_{thjc,н}$ and 83.2°C when $R_{thjc} = 2R_{thjc,н}$, i.e., when thermal resistance increases twice, crystal temperature at the moment of time, equal to thermal constant τ, will increase by 7.6%.

There are no published methods for controlling thermal crystal-package resistance for integrated microcircuits of high-frequency VSCs. However, an access to *p-n*-junction, available within the structure of these VSCs, allows to use the suggested accelerated method for controlling temperature of junction (diode) and, respectively, crystal temperature and thermal crystal-package resistance of VSC integrated circuits, supposing that temperature of *p-n*-junction will correspond to VSC crystal temperature. Thus, *p-n*-junction in integrated circuit LM2676 (Texas Instruments) is between outputs GND and ON/OFF. It is possible, using this junction, to control in an automated manner its temperature and junction-case thermal resistance of integrated circuit and other high-frequency VSCs as follows:

1. First, in laboratory, a relationship between temperature-sensitive parameter (voltage within *p-n*-junction when gauge current is small) and temperature is established. The obtained relationship $U_J(T)$ is used either for immediate determination of thermal resistance, or is approximated by linear dependence

$$U_J(T) = U_0 - K_T T.$$

An example of such approximation by two points is presented in Fig. 10. Linear approximation characterizes relationship $U_J(T)$ by two parameters: temperature coefficient of voltage K_T and initial voltage U_0:

$$K_T = (U_1 - U_2)/(T_2 - T_1), \quad U_0 = U_1 + K_T T_1. \tag{1}$$

Here, temperature of *p-n*-junction shall be defined by measured voltage U using equation

$$T_J = (U_0 - U)/K_T. \tag{2}$$

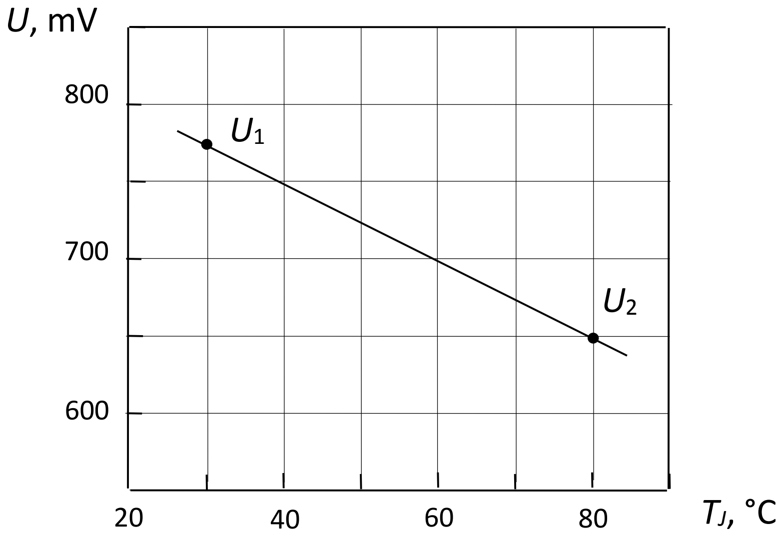

Fig.10. Temperature-sensitive parameter-temperature relationship

2. Thermal resistance of reference integrated circuit shall be defined at the second stage. To this effect, reference circuit is installed into tester, heating mode is turned on, temperature of integrated circuit package is measured, along with the time, upon expiration of which temperature of package will almost stop changing. After dividing measured time by three, an approximate value of thermal time constant τ shall be determined. Heating of integrated circuit continues until package temperature fully stops changing, then the integrated circuit is switched off, and voltage within *p-n*-junction is measured by tester, when gauge current is small.

Temperature of *p-n*-junction T_J shall be defined using measured voltage and dependence $U_J(T)$ or equations (1), (2). Thermal crystal-package resistance shall be defined by equation:

$$R_{thjc}=(T_J - T_C)/P_{н},$$

where $P_{н}$ – lost power (heat flow) in the heating mode, T_C – temperature of package in a steady-state mode.

3. The third stage involves introduction of parameters into tester memory that were defined using reference integrated circuit. To this effect, after complete cooling of reference integrated microcircuit, it is again connected to tester, and voltage within *p-n*-junction is measured, when gauge current is small. Then, heating mode is turned on for a period, comparable with thermal time constant (arbitrary within (0.5…0.8)τ). Then, power is quickly (by means of tester) turned off, and a voltage drop is measured within *p-n*-junction, with small gauge current. Four values are retained in the tester memory: heating duration, two voltages within *p-n*-junction, when gauge current is small, and the value of this current. Preparatory stages, needed to form BM parameters, are completed here, and automated inspection of the entire set of circuits may be started.

Discussion

The obtained time relationships between output voltage and current at the moment of converter's start-up, given in Fig. 4-7, coincide with the results of applying PSPICE-model and experimental studies. It allows to infer that the model is successfully verified.

Applicability of the suggested method is related to the permissible deviation of thermal crystal-package resistance value from the rated value. 2.5% (Fig.9) increase in crystal temperature, when controlling at τ moment in time, corresponds to this thermal resistance exceedance. Such changes in temperature may be safely recorded by automated tester, that enables to arrange for successful automated sorting of microcircuits to be carried out.

However, it should be noted that reduction of heating time results in remarkable reduction of temperature-thermal resistance dependence (Fig. 9). Thus, when there is heating of the same capacity within *0.2τ,* 30% increase in thermal resistance will result in only 1.5 % increase in temperature. A compromise is needed between test duration and accuracy of determining thermal resistance. As per preliminary assessment, it is worthwhile to choose the time for crystal heating within (0.5…0.8)*τ.*

When the suggested algorithm is implemented to control thermal crystal-package resistance in an automated manner, a number of conditions shall be observed.

First, time interval between tripping of thermal capacity and measurement of *p-n*-junction voltage shall be minimized. Taking into account that *τ* of VSC microcircuits is usually several and more seconds, use of switching devices, as parts of tester, that have response time of unities of milliseconds, enables to meet this condition.

Second, it is necessary to ensure that not only time of heating is stable, but thermal capacity as well. Obviously, a connection circuit in heating mode shall be chosen, and an algorithm for stabilizing lost power shall be elaborated for each type part of VSC microcircuit. This algorithm shall be implemented using software-hardware as part of tester, taking into account permissible spread of electrical parameters of microcircuits. Modern automated testing equipment allows to solve this problem as well.

Third, accuracy of determining junction-case thermal resistance strongly depends on stability of temperature-sensitive element (*p-n*-junction) characteristic (Fig. 10) within one set of tested microcircuits.

Conclusions

Analysis of the existing methods for controlling thermal crystal-package resistance of semiconductor devices showed that they are highly labor-intensive with long control process that doesn't allow to utilize them for automated tests of high-frequency VSC microcircuits. This problem may be successfully addressed through the use of the reference behavioral model of microcircuit.

A modified method is suggested that substantially speeds up determination of thermal junction-package resistance of semiconductor diodes, when carrying out automated tests.

Potential application of modified method for automated determination of thermal crystal-package resistance of VSC microcircuits is presented, using *p-n*-junction embedded into their structure.

Algorithm is elaborated to use modified method for automated determination of thermal crystal-package resistance of VSC microcircuits utilizing test equipment.

The suggested method is recommended to be used when controlling thermal resistances of various semiconductor devices.

The method of using behavioral models, discussed in the paper, allows to obtain appropriate results of modelling, comparing with considerably more complex transistor level SPICE-model. Here, improvements in performance are gained and many computational resources are saved.

From the obtained results it can be inferred that behavioral models may be used as a source of reference information during testing electronic components. It enables to greatly reduce the volume of preparatory works when organizing automated testing of microelectronics devices and developing automated testing equipment.

Abstract

The purpose of this article is to establish the level of efficiency rise ways of public administration implementation in the sphere of healthcare in Ukraine on the basis of the international experience use; to define a unified conception of the institutional and legal basics' management in the sphere of healthcare and to offer specific recommendations as to the introduction into legal reality of Ukraine. The methodology includes general philosophical and special methods of scientific cognition namely, the system-analysis technique, the dialectical method, the Aristotelian method and the structural-functional process as well as the range of empirical methods were used while carrying out the research. Authors came to a conclusion about a low adaptation level of a present healthcare system of Ukraine to real population needs. The formal international standards consolidation in a designated sphere does not provide the services in the sphere of healthcare with the availability and quality signs. The free access ability to the international protocols, in accordance with which the treatment should be provided, has to be in Ukrainian which will allow to simplify the procedure of specific decision making in the sphere of healthcare as well as to find mistakes which can occur in medical practice in due course. The research results are relevant for domestic lawmakers and entities which carry out the public administration in the sphere of healthcare against a background of the tendencies actualization of administrative processes democratization in Ukraine. All the results are independently obtained and original (incorrect adoptions and taxes are absent). The subject of research is examined for the first time in Ukraine and has the prospective for further development.

Keywords: healthcare, public administration, financing, institutional and legal basics, international standards.

Introduction
